

Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

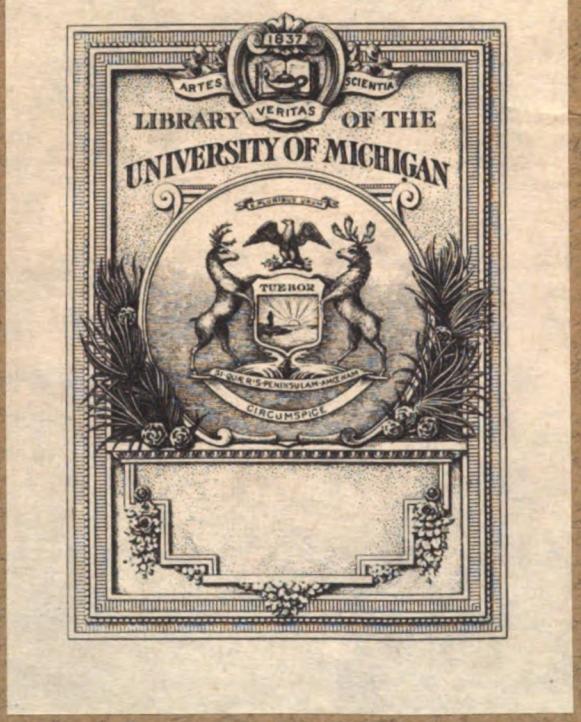
+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.



This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

Dross- *is a danger to the health of your workers!*

AS A SAFEGUARD INSTAL—

Fry's DROSS CONTAINER

(British Patent No. 215410).

CONSIDER THESE ADVANTAGES

1. Elimination of one of the gravest dangers to health in a printing office.
2. One handling only instead of several, thus saving labour, and, incidentally, a most unpleasant job—bagging dross.
3. FRY'S DROSS CONTAINERS are substantially constructed from Iron Castings and Sheet Steel, and strong enough to last a lifetime, even though that lifetime may be prolonged by their use.
4. Floor space required is 12" square only.
5. The price is reasonable.
6. Members of the Joint Industrial Council of the Printing Trade, Master Printers, Stereotypers, and Operators, who have tested the apparatus, unanimously praise it. *Factory inspectors recommend it as essential for every printing works where molten metal is used.*

WRITE TO-DAY for our illustrated pamplet fully describing the container

THE BRITISH & COLONIAL PRINTER AND STATIONER

FOUNDED 1878. PUBLISHED WEEKLY.

WITH MONTHLY SECTION FOR THE BOOKBINDER.

The Recognised Organ for Printers, Printers' Engineers, Wholesale and Manufacturing Stationers, and Makers of Machinery and Appliances for the Paper Bag, Envelope, Box-making, Bookbinding and all Paper and Board Consuming Industries.

VOLUME 96. NUMBER 1. [REGISTERED AS A NEWSPAPER] LONDON: JANUARY 1, 1925 EVERY THURSDAY. PRICE TWOPENCE.

Printers' Costing Problems.

VI. Cost-Finding and Price-Fixing.

In view of the increasing necessity for the adoption of up to date and scientific methods of printing house management, an expert in the subject of printers' costing is contributing a series of articles to this journal. The present article is the sixth of this series, and others will follow at intervals. Questions and discussion are invited.

A great deal of misconception is abroad as to the relationship between the operations of a costing system and the price to be charged to the consumer, and it may be that some may prefer a rule-of-thumb method, a face value method, or what has aptly been described as making deductions by "horse" sense.

The Good Old Days.

Undoubtedly many businesses have in the past been successfully carried on by one or other, or a combination of the methods to which reference has just been made. This was in the days when fluctuations of wages were restricted to small amounts, and expenses varied only slightly from one year to another. Complicated and high-priced machinery was uncommon, and, manual labour being cheap, many operations now performed mechanically were the work of the handicraftsman.

Competition was not so keen, there was less printing done, fewer employees to keep going, not so many master printers, and the representatives as we know them to-day did not exist. Life was less hurried, there was more time to think, and probably fewer mistakes in consequence. If a job did not get done to-day, to-morrow would do just as well. The need for a costing system, if it did exist, was not so insistent as to-day.

Does the printer without a costing system know what a valuable aid to better business it is, and does the printer who has one make full and proper use of it?

The Functions of a Costing System.

A costing system has more functions than that of finding a basis on which to fix a price. It is a means of finance control for which there is no substitute. It is a seeker out of inefficiency and the sworn enemy of waste. Unless these functions are studied and the findings acted upon, the firm is like a ship with a rudder but no helmsman to guide it.

There are printers who claim to be able to value a job on sight, but a proper price is as difficult to fix as it would be to shoot a rabbit without pellets in the gun. It is easier to cross the Atlantic since the invention of the sextant and the chronometer than to find one's way across any well known square in a fog, and it is certainly easier to fix a price where a costing system is in operation than where uncertainty of costs exists. But, says the sceptic, how am I to know what is a proper price? The answer is that comparisons are the foundation of all discoveries—it is only by comparison we find the differences. By comparison of times on similar operations and jobs, by testing hourly rates for variations, and by frequent checking of results, confidence in the charges emerge just as surely as one makes a turn at the right corner, and does so semi-consciously, on the daily journey to business.

Costing and Standard Time.

How many readers of this article who regulate their watches and clocks by the nightly "six-dot seconds" stop to think of the wonderful system behind it all. Not one of them would think to challenge the 9.30 time signal if there was a difference between the signal and the seconds finger of their watches—it is the watch that would be regulated on every occasion.

Why should not the same reliance be placed on the results of a scientific costing system which has been in operation long enough to establish a series of records?

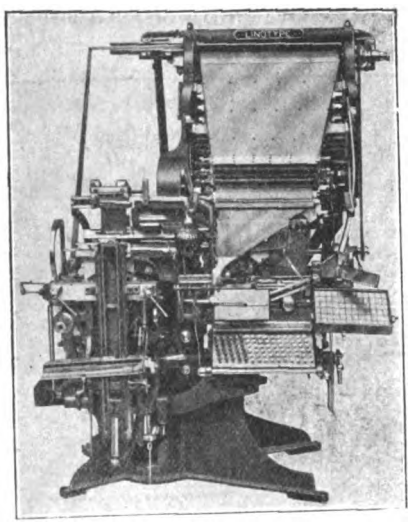
An Axiom.

It is an axiom that business cannot be carried on without a profit. How, then, can profit be decided upon until cost is known? There is no immorality in working on a fixed rate of profit—it would be an ideal state of business, but jealousies and avarice cause the amount to be varied according to circumstance. Losses are incurred when determination to secure an order prevails over common sense.

It was stated early in this series of articles that cost was a *fact* and price a *policy*. If the expenses have been properly apportioned to the various producing centres and the hourly rates correctly ascertained, every hour spent on a job should be transferred to the cost sheet of that particular job. It is immaterial whether the expenses are too high or the time spent on the job too long; the result is the *cost* of the job, and any trimming, either of the hourly rates or of the time taken, with a view to getting other results is as absurd as it is foolish. The selling price has to be decided *after* the cost is found.

What is a Reasonable Profit?

If a job has *cost* £20 to produce under normal conditions it should certainly have from 15 per cent. to 20 per cent. added for profit. If sold for less than £20 it is poor business, but it is better to know the amount of the loss than to trim down the cost in order to put a fictitious profit at the foot of the cost sheet.



Estimating.

There is a considerable amount of estimating being called for to-day. On the one hand, the consumer is desirous of getting his work at the lowest possible price and casts about to find the cheapest market; on the other hand the manufacturer is equally anxious, and, needing work, deliberately fakes his estimates or sacrifices his profit. The buyer and the seller find a point where a transaction can be made, but, unfortunately, to the detriment of the seller and sometimes with little advantage to the buyer.

It is to be regretted that sometimes a third party will meet with misfortune. A reproduction of a job may be contemplated for which a reasonable figure has been charged, and the lowering of the prices is likely to do more than remove the order from the factory of a competitor: it may do him irreparable harm. Few of the readers of this article can have escaped these unpleasant experiences.

THE NEW MODEL 4 THREE-MAGAZINE LINOTYPE IS EQUIPPED WITH ALL THE LATEST IMPROVEMENTS

—including:

IMPROVED MAGAZINE-CHANGING MECHANISM, whereby not only may the magazines on the machine be changed more easily than ever, but any of the three magazines can be replaced by others without removing those still required on ths machine.

IMPROVED ASSEMBLER DRIVE, through shaft and helical gear instead of belt.

IMPROVED CASTING MECHANISM, with Double Pump Spring Attachment, the extra pressure being available at the will of the Operator.

AN EXTRA SAFETY DEVICE, whereby it is impossible for the Operator to start up the machine until the line is transferred from the first to the second elevator.

A FULLY AUTOMATIC DEVICE for casting blank lines.

ASSEMBLER ELECTRIC LIGHT FITTING, arranged to give the Operator a perfect light on both assembler and copy, and at the same time to protect his eyes from the glare of the lamp.

This improved model is so constructed that the *Large Display Section can be added* in the customer's own office at any time.

Write for full particulars to:

LINOTYPE AND MACHINERY LIMITED

Head Office: 9 KINGSWAY, LONDON

Manchester: 4, Cannon Street.
Bristol: 51, Broad Street.
Glasgow: 197, Howard Street.
Dublin: 15, Sackville Place

A Standard of Measurement.

In the printing industry there is a standard of measurement known as "type-high," and before a job can be printed, all parts of the forme must be brought into accord with it. Except for individual factories, there can be no standard of costs, but there may be useful comparisons made with average figures. Price Lists may be compiled, but the margin of profit in different offices will be as variable as a typical English summer.

If, after comparison has been made, it is found that wide variations exist, the cause should be sought for and if not found it may be advisable to seek expert advice and assistance. It should be borne in mind that price does not always adversely affect a business, and the *other* causes are generally the most difficult of ascertainment.

It is conceivable that firms with high costs may, whilst maintaining their charges, successfully compete with firms whose costs are low; but there must be either quality or service as a concomitant.

The Standard of Price

The standard of price by which every job should be tested is that of cost, but the basis on which the costs are founded must have been tested and proved by experience as not only accurate but equitable. It is not necessarily a sign of bad management that costs are high: it may be entirely due to efficiency. Many departments working on low rates produce higher job costs in consequence of lack of material or tools.

A reputation for service, quality, and uniformity of prices is the best for business. It will be noted that service is placed first: more business is lost through the making of excuses than is generally known.

THE second edition of 1,000 copies of Mr. Heckford's elementary book on papermaking has been issued, a large proportion having been subscribed for before publication. There are still a few copies available.

MR. H. D. HIGHAM, who recently commenced business as a wholesale and export paper specialist located at 52, Queen Victoria-street, informs us that owing to increased business he is taking larger premises and is removing to 30, Ludgate-hill. His new 'phone number will be Central 4464.

IN connection with the *Daily Telegraph* Sports Club an enjoyable evening was spent recently at Lever House Restaurant, where a large number of friends were entertained on the occasion of the second annual concert. Col. E. F. Lawson presided, and Mrs. Lawson distributed the prizes won at tennis and cricket during the past season.

MR. R. S. KELLOGG, secretary of the News-Print Service Bureau, N.Y., has published in appropriate form what is entitled "The Story of Ts'ai Lon." Printed on deckle edge paper and bound in a mottled brown cover paper, the letterpress tells the story in an ingenious and attractive manner of developments in the manufacture of paper from its first introduction into China down to the present day. The great space of time covered and the distance travelled by this story is represented on the inside of the covers, first by a specimen of Chinese hand-made paper made at the rate of 1,200 sheets a day by one man, and a specimen of modern news-print paper made at the rate of 100 tons per day on one machine.

St. Bride Technical Library.

London Master Printers' Gift for Books on the Craft.

The Technical Library of the St. Bride Foundation Institute, which is well known to all concerned with the printing and allied trades, has been suffering for several years from lack of funds, and the London Master Printers' Association have generously presented the sum of £25 to form the nucleus of a fund for the purpose of keeping the collection up to date.

Further donations will be gratefully accepted.

Authors of works relating to printing, publishing and the allied trades are specially asked to present copies of their works for use in research and for permanent preservation.

The annual subscription to the Institute, which entitles one to many privileges beside the libraries, is 5s. per annum. A subscription of one guinea per annum consitutes honorary membership.

Printing Type Exports and Imports.

EXPORTS.—Exports of printing type from this country during November amounted to 17 tons (of the value of £6,665), against 23 tons (£7,604) in the corresponding month of 1923, and 13 tons (£4,829) in November, 1922. In the eleven months ended November shipments of printing type stood at 180 tons (£63,471), compared with 181 tons (£63,281) in the eleven months of 1923, and 166 tons (£55,580) in the 1922 period.

IMPORTS.—Printing type imports represented 2 tons (£1,096) during November, against 4 tons (£1,469) in the corresponding month of 1923, and 2 tons (£1,044) in November of the preceding year. In the eleven months ended November these imports amounted to 37 tons (£16,335) compared with 41 tons (£20,8.0) in the eleven months of 1923, and 34 tons (£12,631) in the similar period of the year before.

MR. H. W. SHEPHARD, who has retired from the Press Association after 51 years' service, was recently the recipient of a presentation from the staff. He was for many years City editor of the Agency.

At the Printers' Almshouses.

A Happy Christmas Gathering.

There were many and pleasing signs of the approaching Christmas festival at the Printers' Almshouses, Wood Green, on Saturday, December 20th, when Mr. George Rooke Collingridge (the *City Press*) once again played the part of Santa Claus, and genially presided over a tea and concert in the handsome board room of the Institution.

The company included Mrs. George Rooke Collingridge, Dr. F. James (medical officer) and Mrs. James, Miss E. Parsons, Mr. Crowther, Mr. Joseph Mortimer, O.B.E. (secretary), Mr. W. J. Franklin (collector), Mr. G. F. Higham (King's Printing Office), Mr. W. Vandy (chairman of the Almshouse Visiting Committee), and Mrs. M. Jansen (resident nurse).

Mr. Jackson West's Entertainers provided a first-rate and varied musical programme, the following contributing to the evening's enjoyment, their songs and sketches being enthusiastically received: Miss Gertrude M. Jones, Miss May Velroy, Mr. Leslie Brookes, and Mr. Jackson West. Mr. Eddie Hepworth kindly acted as accompanist; and all were specially thanked by the chairman for the musical treat they had provided.

Great pleasure was evinced during the evening at the receipt of a telegram from Buckingham Palace to Mr. George Rooke Collingridge, in which H.R.H. Prince Henry "desired the chairman to convey to the old people his Christmas greetings and all best wishes for a happy New Year." Congratulatory telegrams and messages were also received from Major the Hon. J. J. Astor, M.P. (president), Alderman Sir Geo. Wyatt Truscott, Bart., Alderman Sir Charles C. Wakefield, Bart., C.B.E., Rt. Hon. C. W. Bowerman, M.P., J.P., Dr. W. E. Porter, J.P., and Mrs. Porter, and Mr. F. R. Briant and Mr. F. P. Lewingdon (members of the Council).

Mr. Collingridge then read out a long list of donors, remarking that he was greatly indebted to his many personal friends who had so generously responded to his appeal on behalf of "Gift Saturday": it was a record result. His audience were evidently of the same mind to judge by the hearty cheers they accorded to the donors.

Mr. W. Vandy, in felicitous terms, conveyed the united thanks of the residents and the Council of the Corporation to Mr. Collingridge for giving them such a delightful and happy evening.

Mr. Collingridge, in reply, said that his endeavours had been a labour of love, and he hoped long to have the privilege of coming amongst them.

The singing of "Auld Lang Syne" brought a very happy Yule tide gathering to a close.

MUCH has been made of the possibility of United States financial control of the Canadian paper industry by those not in a position to know, or by European interests competing in world markets for the news-print trade. A recent statement shows that of the total investment of approximately $294,000,000 in the industry, $204,000,000 is held in Canada, $57,000,000 in the United States, and $24,000,000 in Great Britain, the remainder being held in a number of other countries.

Trade Notes.

MESSRS. DUNN AND WILSON, bookbinders, of Falkirk, are planning to build a new bookbinding factory in the town.

THE removal of a large printing machine at the *Torbay Express* office, Torquay, and the installation of a rotary machine in its place—work which was being done at high pressure night and day—was marked by two bad mishaps on Christmas morning. Just before 4 o'clock a piece of the frame-work slipped and fell over, crushing against a wall the left leg of the chief engineer, Mr. William Pooley, of Brixton, London. The limb was fractured and the sufferer was removed to the Torbay Hospital, where he is at present detained. Later the same day, about noon, a large gang of workmen were engaged in hoisting a portion of the plant, weighing about a ton, on two tackles, when one of the chains broke. The piece swung on the other chain and all the men jumped clear except Robert Bartlett, of Exeter, who slipped and fell, breaking his left wrist and injuring his back. First aid was rendered by the police, and a doctor who was passing ordered Bartlett's removal also to the hospital.

THE *Lincoln Gazette*, an old-established county weekly, ceased publication on Saturday, together with subsidiary papers, the *Alford, Spilsby, and Horncastle Gazette*, and *Grimsby Gazette*. The papers were founded in January, 1859. Their chief features are to be incorporated in an enlarged edition of the *Lincolnshire Echo* on Saturday.

IT is stated that the *Freeman's Journal*, the Dublin newspaper which ceased publication last week, may resume under new management in a few weeks' time.

THE Bradford Trades Council has decided to call a conference of representatives of trade union and labour organisations to consider the possibility of starting an evening paper in the interests of local Labour.

THE *Irish News*, Ltd., and the editor of the paper, Mr. McCarthy Timothy McCarthy, were fined £10 each at Belfast for a breach of the Civil Authorities (Special Powers) Act, Northern Ireland, by spreading a false report regarding an alleged bomb outrage in County Tyrone.

A CONFERENCE is to take place between the Federation of Master Printers and the Typographical Association on Tuesday next, January 6th, when the main question to be discussed will be the application on behalf of workers in daily newspaper offices in the provinces for a night off per fortnight and half-a-day per week for the night hands and half-a-day off per week for the day hands. Further consideration will also be given to other suggested amendments of the general rules of the T.A.

JOINT INDUSTRIAL COUNCIL.—Many of the standing Committees of the J.I.C. are to meet next week, including those concerned with Health, Apprenticeship, Unemployment, and Organisation, to consider the reports to be submitted to the quarterly meeting of the Council on January 14th. In addition to the usual quarterly business, the Council will consider arrangements for the convention which it is proposed to hold next May.

THE quarterly meeting of the Council of the Federation of Master Printers will be held on Tuesday the 13th inst., when a special feature will be the presentation of a portrait of himself to Mr. R. A. Austen-Leigh, M.A., as a token of appreciation of the valuable services he has rendered to the Federation, during his term of office as president and in many other capacities. The Labour Committee will have an important report to submit, and out of the report by the Legislation and Contracts Committee several important topics will arise for discussion. The Collective Advertising Committee will also report fully as to the present position of the campaign and will outline further developments.

EXHIBITED in London for about six months, a poster which depicts "Tendelaye," a half-negro girl and an English coloniser in a love scene in "White Cargo," has come under the ban of the Lord Chamberlain.

LORD NEWTON has introduced in the House of Lords his Advertisements Regulation Bill, which provides for local authorities to be authorised to make by-laws for regulating, restricting, or preventing the exhibition of advertisements in such places or by such means as to affect injuriously the amenities of public parks or pleasure grounds, or to disfigure the natural beauty of a landscape. The Bill is supported by the advertising section of the London Chamber of Commerce and the Royal Automobile Club.

ROCHDALE PRINTERS' CARNIVAL.—To celebrate Christmas, the Rochdale and District Printing Crafts Guild held a fancy dress carnival in the Provident Hall, Lord-street, Rochdale. Over 300 persons were present, and the affair was a huge success.

FOOTBALL.—With the object of assisting the funds of the Printers' Pension Corporation, a football match was played on Boxing Day between teams representing the Printing and Allied Trades Charity Sports Association and the Peckham and District League. The match, which was played on Messrs. Waterlow's Sports Ground, Chingford, attracted a large gathering, and resulted in a win for the League team by 7 goals to 2. Medals to the winners were presented by the proprietors of the *Daily Telegraph* and to the losers by the chairman and secretary of the Association.

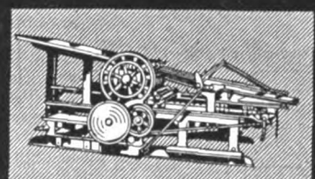
P.M.A. DANCE.—A dance in aid of the funds of the Printers' Medical Aid Pension is to be held at Leverhouse Restaurant, Blackfriars-bridge, on January 19th. Jimmie Gardner's Gleniffer Dance Band will be in attendance, and the dancing, which will commence at 7.30 p.m., will terminate at 11.30 p.m. The price of the tickets, to be obtained of Mr. Arthur O'Connor, 30, Fleet street, E.C., is 2s.

WITH a total of 12,706 books recorded by the *Publishers' Circular* as having been published during the past twelve months, the year 1924 takes rank as the record year in the history of British book production. This is an increase of 432 over the total for 1922, and of 327 over the previous "record" year of 1913.

MR. GEOFFREY LLOYD, works manager of Messrs. E. Mortimer, Ltd., printers, Halifax, has died at Ogden, Halifax, at the age of 49 years.

MR. W. H. BRADLEY, who has died at Leeds, at the advanced age of 86 years, was from 1885 to 1892 editor of the *Yorkshire Weekly Post*. Mr. Bradley was at one time treasurer of the Leeds branch of the Institute of Journalists.

THE death has occurred of Mr. Robert Cairns, who had been engaged in the composing room of *The Times* for the last 41 years. He was in charge of the Printing Section of *The Times* Pavilion at Wembley Exhibition, where his amiable personality impressed many of the visitors, especially those from overseas.



THE late Mr. Ebenezer Joe Kibblewhite (78), of Wood Green, N., editor of the *Weekly Times and Echo*, 1884–1910, and until recently editor of the *English Mechanic*, one of the original members of St. Pancras Borough Council, and late managing director of the Strand Newspaper left £1,312 (net personalty, £1,236).

UNEMPLOYMENT in the German printing and bookbinding trades showed a heavy increase at the end of October as compared with the end of September, there being over twice as many workers unemployed, though the figures were very much better than in October, 1923.

WE most heartily congratulate those responsible for the "*Times of India* Annual," this year's issue of which is a triumph of Indian printing. The "Annual" is, we understand, entirely an Indian production, the work being supervised by Europeans selected in London by the management and many of whom have been with the concern for 15 years. Knowing something of the difficulties commonly encountered in India in respect of maintenance of machinery, supplies and labour, we marvel at the excellence of the colour work, half-tone and letterpress represented in this handsome Annual, which, by the way, has been published yearly since 1910.

The AMERICAN MIEHLE COMPANY'S PRESSES

SINGLE-COLOUR TWO-REVOLUTIONS
TWO-COLOUR TWO-REVOLUTIONS
PERFECTING TWO-REVOLUTIONS
THE "VERTICAL" JOB-PRESS

COST.

IN the last analysis overhead costs are based upon the units of final production.

An overhead of 10/- per hour bears twice as heavily on the press which produces one thousand impressions in a given time as upon one which produces two thousand.

This fact accounts for the ever-widening use of the American Miehle Company's Presses.

THE AMERICAN MIEHLE COMPANY'S PRESSES ARE MANUFACTURED BY THE MIEHLE PRINTING PRESS AND MANUFACTURING CO. AT CHICAGO AND ARE SOLD IN GREAT BRITAIN AND IN BRITISH OVERSEAS TERRITORY BY THE

MIEHLE PRINTING PRESS AND MFG. Co LTD.,

Retrospective and Prospective.

A Year with No Outstanding Achievements.

The year 1924, which has now come to an end, cannot be said to have brought us anything startling or revolutionary in the way of machines or methods of a character to further the progress of the printing art. The much-talked-of photo-mechanical typesetting machines have not as yet materialised into practical appliances that will supplant hand or machine composition as at present carried on, but their inventors are still at work, and considerable progress has been made towards perfection, so that the near future will probably see one or more of the new machines in commercial operation. The letterpress section of the trade should not undergo much modification by the advent of photo-typesetting appliances, as their product has to be machined on offset or lithographic presses; but in the litho department their introduction will cause a change in some of the present-day methods.

Litho versus Letterpress.

Our columns during the year have testified to the interest taken in offset, photogravure and other methods of printing, as opposed to letterpress, and several excellent and informing lectures have been given to the members of the trade on these matters. Offset printing is becoming daily more popular, and there have been so many improvements in the gravure process, both in methods and machines, that it is rapidly coming to the front as one of the best of our illustrative methods. Efforts are being directed to reduce the cost of production in gravure printing, and it is suggested that thin copper plates bent round the cylinders might well take the place of the more expensive copper cylinders at present in use. One firm is working in this direction, and these copper sheets may soon be available for the printer who uses this beautiful printing process. Developments have also taken place in the collotype process, a method of printing that has been looked upon for a long time as difficult to work in our changeable climate, and a modification of the process, under the title of "Sperati," is now being advocated. In this process the glass plates are dispensed with and the necessary printing surfaces are obtained on films, thus doing away with risk of breakage, a danger that always worried the collotype pressman while running off his impressions. Its sponsors are optimistic, and claim that "Sperati" gives the additional advantage of greatly increased speed of output. During the year we have recorded several improvements in machinery for printing by what we may term these newer methods, and, incidentally, have called attention to the rotary web offset press, manufactured by Messrs. Linotype & Machinery, Ltd., which produces from a web of paper well-printed newspapers and illustrated magazines, thus competing with the rotary letterpress machine. Another appliance, which has now reached the point of the "finishing touches," is the "Printex" negative printer, for the rapid production of photo-lithographic printing plates that involve the printing down on metal of many copies of a single negative, and that enables work to be done with a rapidity that puts hand transferring quite in the shade. This appliance embodies first-class British craftsmanship and will be marketed by the Pictorial Machinery Co., Ltd.

For the Letterpress Printer.

There is very little to record in the way of new machinery for the general letterpress printer, but among the newer appliances that have been noticed in our columns was the "Auto-Monopol" platen, a platen with self-feeding and delivery, and that may be used for printing, cutting and creasing, and other work. The American Miehle Co.'s two-revolution press was also illustrated and described, as were a number of interesting minor machines for use in the foundry, and in the bookbinding departments.

A New Theory of Colour.

Those interested in colour printing had a new theory of colour put before them by Mr. A. E. Bawtree, whose expounding of the principles of the new method is tending to upset to a considerable degree the notions of the conventional theorists who have for so long adhered to the division of the spectrum laid down in the Newtonian theory and reproduced in most of the text-books on the subject since Newton's time. In our issue of April 10th last we gave a report of a lecture by Mr. Bawtree, in which he discoursed on his theory and gave practical illustrations to prove his assertions. An example of the reproduction of a colour print by the Bawtree method was shown at the exhibition of the Royal Photographic Society in October and attracted much attention. In the past Mr. Bawtree's name has been associated with the invention of a photo-composing machine, it will now be also associated with colour reproduction, and, with his versatile talents, there is no saying in what other department of the trade he may spring a surprise upon us.

The British Empire Exhibition.

From a general business point of view the most important event of the past year was the great Exhibition at Wembley. Master printers from all over the world came to visit it, and although the printing craft was but poorly represented, they found much that would educate them in the collection of exhibits of the graphic arts and in the fine collection of colour work, as applied to outdoor advertising, that was shown in "Poster Street." The latter contained some very fine specimens, and eminent artists, aided by the many firms of colour printers who showed examples of their work, made the collection well worth inspection. It would almost be invidious to refer to any special firm where all excelled, but the work of Messrs. Bemrose; Vincent, Brooks, Day & Sons; Chorley & Pickersgill; Formans'; and Waddingtons', were all worthy of the highest praise. The great Advertising Convention, held at Wembley, at which something like 3,000 delegates attended from all parts of the world, over 2,000 coming from the United States alone, was a remarkable feature of the year, and was attended by many of our leading master printers and others connected with the craft, and it is to be hoped that as a result of the booming of advertising that took place a good many orders may find their way to the printers. The Exhibition itself provided a considerable amount of work for the printing press and led to an enormous use of paper. Of one folder issued five and a half million copies were required, and from 200,000 to half a million was about the ordinary order for a considerable number of booklets and other matter that was distributed as propaganda. One poster alone ran into a run of 500,000 copies, and taking the work of the various railway companies that advertised their lines as leading to Wembley, the printer came in for a very fair share of work indeed. The absence (with a few exceptions) of exhibits of printing machinery and appliances was regrettable. They lost a splendid opportunity of showing and selling their wares at Wembley, and many expressions of dissatisfaction were heard from printer visitors from our Colonies, who expected to see and purchase new plant while they were in this country.

Advertising for the Printer.

A feature of the past year was the furtherance of the movement having for its object a combined effort at advertising for the purpose of benefiting the trade. Two years ago the scheme was first proposed, and since then the best brains of the Federation of Master Printers have been at work upon it, until now the completed plan has been put into operation and is to be pushed for all it is worth. Collective advertising has already been advantageously adopted by many of the great industries of this country, and it is to be hoped that the result of the printers' campaign will be more work and more money for all concerned in the industry. It is desirable that the effort that is being made in this direction receive full and ample support from all master printers, and that no one will stand apart and allow his fellow-members of the Federation to bear unaided the costs of a scheme which is to benefit all.

The Year Before Us.

As to the coming year, the prospects, if not rosy, are certainly better than twelve months ago. There is more work being done and there are fewer unemployed printers, which is all to the good, and with general trade better stabilised and the collective advertising scheme in full working order, printers will, we hope, find an increased amount of business on their hands—provided wage disputes or other troubles do not spoil the possibilities. As to whether such increase will bring increased profits, that depends on the efficiency of one's costing system. It is to be hoped that with a growing volume of business there will not come a tendency to cut prices and do more work for less money. The year 1925 is to bring another Printing Exhibition, and the trade may look forward to seeing all that is new in the way of machines and appliances at the coming Show. The general outlook for the year that has just dawned is encouraging. It remains for us all to hope and work, that it may bring a greater measure of prosperity to the trades we represent.

Printers' Managers and Overseers ASSOCIATION.

Manchester Centre Annual Meeting.

The twentieth annual general meeting of the Manchester and District Centre was held in the Mitre Hotel, Manchester, when the retiring president, Mr. Fred. E. Robinson, occupied the chair.

The Year's Work.

The reading and passing of minutes being followed by the roll call and apologies, the next business was the annual report and balance sheet, as follows: "The twentieth annual report and balance sheet for the year ending October 31st, 1924, is presented by your executive, and they are pleased to record that interest has been maintained, the various meetings and social functions being well supported. Nothing has transpired to cause our members to defend themselves as a body against injurious propaganda. The annual dinner was well attended, some of our guests being Mr. A. H. Wilson (vice-president) and Mr. E. W. Whittle (general secretary), London; Mr. Chas. Mackie (president) and Mr. Jas. N. Poole (secretary), Liverpool; Mr. A. L. Hamer (vice-president) and Mr. H. O. Pattinson (secretary), Yorkshire; Mr. John Taylor (president), the Printing Crafts Guild; Mr. W. S. Whittaker and others. The United Gathering was held in Birmingham. The motor tours through Kenilworth, Warwick, Leamington Spa, Stratford-on-Avon, and Lichfield gave everyone an opportunity of seeing some of the most beautiful and romantic country in the British Isles. The Seeley Cup competition created friendly rivalry between Liverpool, Yorkshire and Manchester, the senior provincial centre retaining possession of the cup for a second year. In September, through the kindness of Messrs. Mander Brothers, Ltd., an interesting and educational day was spent visiting the several works in Wolverhampton and Wednesfield. The balance sheet shows income £241 0s. 5d.; expenditure, £236 2s. 2d.; there being a balance in hand amounting to £4 18s. 3d. Twelve council meetings have been held, the attendances being as follows: A. Hellewell, 12; F. J. Hughes, 12; Jas. E. Mayo, 12; F. E. Robinson, 12; Edward McVay, 11; J. H. Nuttall, 11; Geo. H. Rider, 11; Frank Scouler, 11; E. C. Balls, 10; A. Gavin, 10; A. J. Gyngell, 10; W. Smith, 9; F. Burnett, 8; J. Winstanley, 1. Tylers: J. W. Philbin, 12; A. Piggott, 8. The membership at the commencement of the year was 89. It is with sincere regret that we record the passing of Mr. Chas. N. Knowles, our first secretary, and Mr. Alfred Young, both members having faithfully carried out their duties whilst in office. Mr. Albert Jones was admitted to membership, therefore the total at 31st October was 88. [Here follows the syllabus for the past year.] The thanks of the members are hereby tendered to the undermentioned for their help during the past session: Messrs. E. Hulton & Co., Ltd., Mr. Martin Slattery, The Ludlow and Elrod Company, Mr. J. H. Nuttall, The Lanston Monotype Corporation, Ltd., Mr. Ervine Law, Mr. Ernest Garrett, Mr. Robert Christie, The Birmingham Centre, Mr. Fred Seeley, Messrs. Linotype and Machinery, Ltd., Messrs. Mander Brothers, Ltd., Mr. A. J. Gyngell, and others.—Fred. E. Robinson (president), F. J. Hughes (secretary)."

Digitized by Google

Mr. E. C. Balls moved the adoption, and Mr. F. Scouler seconded.

An explanation being requested respecting the large sum of money outstanding, the secretary replied that the greater part had been accounted for, there being only two doubtful members. Mr. E. Fisher and the secretary having promised to see the two delinquents, the report and balance sheet were then passed.

Election of Officers.

Messrs. E. Fisher and F. Scattergood being appointed scrutineers, the election of officers followed. These were: President, Mr. F. Scouler; vice-president, Mr. A. Hellewell; trustees, Messrs. Edward McVay, J. H. Nuttall; treasurer, Mr. Jas. E. Mayo; secretary, Mr. F. J. Hughes, 424, Moston Lane, Manchester; executive council, Messrs. E. C. Balls, A. J. Gyngell, Geo. H. Rider, R. W. Hughes, J. Ball, Wm. Bardsley, F. E. Robinson, J. W. Philbin; Tylers, Messrs. J. McCosh and E. Garrett.

The usual votes of thanks to retiring officers concluded the business portion of the meeting.

Smoking Concert.

The smoking concert brought together a fair gathering of members and lady companions, the artistes—Miss Beswick, Miss Jean Handforth, Madame Patti Mayo, Mr. J. H. Nuttall, Mr. A. Hellewell, Mr. W. Smith, Mr. J. Winstanley—giving a good account of themselves, with Mr. Harold Creech and Mr. Cecil Robinson as able accompanists.

On Saturday last in the Co-operative Hall, Downing Street, Ardwick, Manchester, a successful whist drive was held, there being present about one hundred ladies and gentlemen. The prize-winners were:—Gents.: 1, Mr. A. Piggott (189), biscuit barrel; 2, Mr. G. Chapman (177), timepiece; 3, Mr. J. Winstanley (170), leather pocket wallet. Ladies: 1, Miss Jessie Glover (175), clock; 2, Mr. F. J. Hughes (178, less 3 forfeit for playing as lady, 175), framed picture, "Bubbles," presented by Mr. A. J. Gyngell; 3, Mr. E. Dixon (176, forfeit 3, 173), silver jam dish. Hidden numbers—Miss A. Murray and Mr. A. Hall, trump indicators. Mr. Harold Nuttall efficiently carried out duties of M.C. WEE MAC.

Lecture by Mr. William Gamble.

The Central Districts Branch of the London Master Printers' Association have arranged a lecture to be given at Stationers' Hall, Ludgate-hill, on Wednesday, January 7th, 1925, at 6.30 p.m., by Mr. William Gamble, F.R.P.S., F.O.S., entitled "The Trend of Photo-Engraving and Photo-Offset Printing." Matters dealt with will include: Influence of offset on block making; limitations of offset for half-tone reproduction; possibilities of grain process; necessity of high light reproduction for colour work; insufficiency of the tri-colour method for lithography; processes for reducing retouching in colour work; registration difficulties; possibilities of printing litho-prepared plates on letterpress machines; reprinting of books by photo litho methods; the photo composing idea; web rotary offset printing; prospective developments in multi-colour printing.

Specimens of the processes referred to will be displayed, and a comprehensive exhibition of lithography, photo-litho and offset by leading members will be open from 5 p.m. All master printers, whether members or not, will be admitted on presentation of trade card.

New British Patents.

For the benefit of our readers we have arranged for any inquiries relating to Patents, Designs and Trade Marks to be answered, free of all charge, by a Fellow of the Chartered Institute of Patent Agents. Inquiries should be addressed, in the first instance, to the Editor.

Applications.

THURSDAY, JANUARY 1, 1925.

Christmas Trade.

THE festive season has not failed to bring the wonted spurt in the buying of print. Very brisk business is reported in the Christmas card trade, and we should judge that there is no ground for fearing a decline in the popularity of the Christmas card, the public demand being maintained at a very high level. The buying of books as presents is another important factor in the seasonal sale of the printer's products. Post Office reports as well as trade information suggest that this Christmas has seen a big advance in the favour with which books are regarded as appropriate gifts. The prevalent optimism has resulted in a general lavish expenditure at the shops, and this must have meant, and must further mean, the consumption of print in the hundred and one different forms in which it is essential to present-day business.

Collective Advertising.

THE collective advertising scheme adopted by the Federation of Master Printers is meeting with a considerable amount of appreciative response throughout the industry. In addition to the meetings already held in London and Scotland, many meetings have also taken place in the provinces, some particularly interesting ones having been held in Lancashire and Yorkshire. It is satisfactory to learn that many thousands of names have already been received at headquarters from printers who wish prospective customers to receive the advertising literature. It was thought advisable, however, not to dispatch the booklets to traders until the latter part of January, in order that all members of the Federation may have ample opportunity of sending in their lists of names. It is intended to tabulate all the names sent in, and thus eliminate duplication, but so far it is reported that the number of duplicate names submitted is remarkably small. The success which has attended the collective advertising schemes of the Christmas card manufacturers, the book publishers and others has certainly opened the eyes of printers to the possibilities of their own scheme, and we believe that adequate support will be forthcoming to carry it to fruition. Meetings have been arranged for the current month to carry out further propaganda on behalf of the scheme, and the president and secretary of the Federation are expected to visit Bristol on January 19th and Cardiff on January 20th, whilst in the Home Counties arrangements are being made for meetings to take place at Tunbridge Wells and on the South Coast. Printers everywhere will be well advised, for their own good and for the good of the whole industry, to lose no time in linking up with this important forward movement.

Printers and the Swindler.

THE swindler has many tricks to aid him in his nefarious attempts to obtain something for nothing, and amongst them is the old dodge of ordering goods on well-printed note headings—if bearing the name of a responsible firm so much the better. Sometimes the bogus dealer has these printed for him, and sometimes he manages to annex a few from the printer for nothing. The common artifice is to call at a printer's and enquire the price for some thousands of letter headings, and could the printer give a few specimens so that he may consult his partner as to style, etc., before placing the order? In most cases samples are freely given in expectation of securing a new customer, but, alas, the prospective client is never seen again, and he proceeds to utilise the letter headings he has obtained for the ordering of goods, which he usually intercepts on the way and by means of some tale to the messenger gets possession of before they have reached the premises of the firm in whose name they were apparently ordered. The Kodak Co. have recently been the victims of a dodge of this kind, and a customer has written to that firm remarking how easy it is to secure a supply of printed headings for the purpose of carrying out a swindle of this kind. The writer of the letter says:—"Some while ago I wrote to a printing firm enquiring for prices, etc., of billheads and in reply received about twenty samples. Of these only a few had prices written on them and few were defaced sufficiently to prevent an unscrupulous person from using them. As it would appear to be the custom of certain printers to print a few extra for samples when executing an order, ought they not to mutilate such samples before sending them out so as to make it impossible for them to be used?" The suggestion given here is certainly a good one, and printers would be wise in seeing that samples given to strangers are marked in some way that would prevent their being used. A rubber stamp with the wording "specimen only" might be effective, but, as stamping ink may be easily removed by the application of methylated spirit, it would be better to have a perforator with such wording or design as would make the sample sheet unusable for fraudulent purposes. In all cases that seem at all suspicious printers should be careful not to play into the hands of those who live by their wits.

Printers' Costing Problems.

Handling Charges Discussed.

In respect of the series of articles running in our columns on "Printers' Costing Problems," a provincial correspondent writes us as follows:—

"I notice that a contributor to one of your recent issues makes some interesting references to the subject of handling charges upon materials, apropos the correct costing of print, and refers to the item of 16⅔ per cent. recommended as the correct amount by the Federation, the accuracy of which I have never been able to recognise.

"To begin with, at least 2½ per cent. and frequently more is deducted by the customer for discount, and I do not think many jobbing printers obtain their sales at an average cost of less than 10 per cent. It should be noted that both these items are calculated upon *returns* and not upon cost, and if we take their total at only 12½ per cent. they will be found to amount to about 16 per cent., or very nearly so when calculated upon the cost price. This leaves about ⅔ per cent. to cover the following items: Interest on capital invested in stock, rent of warehouse, insurance, damage to paper while in stock, buying costs, etc. I believe that closer investigation will confirm my experience that the handling charge on materials should never be less than 25 per cent., and frequently more."

To this letter the author of the articles referred to replies as follows:—

"Whilst your correspondent refers to the articles as 'interesting,' it is apparent that he has not read them carefully, or he would not have misquoted me. Nowhere in the articles is 16⅔ per cent. referred to, but on the contrary 20 per cent. is given as the figure mentioned at the Cost Congress at Norwich. That he has gone fully into the question of handling charges is evident by his dissections and his findings are worth consideration by all master printers. The points raised may be taken seriatim:—

"*Discount.*—In the Federation Costing System the balance given over the amount received is added as an item of cost, and would appear (in part) in the handling charges. The giving of discount calls for more consideration than it usually receives, and where terms are quoted they should be more rigidly enforced.

"*Cost of Sales.*—The figures given in these articles were those disclosed at the Cost Congress and stated to be average figures. That being so, it must be accepted that average 'selling' expenses are less than 10 per cent. It is conceivable that in some businesses the figure will be considerably higher than the average.

"*Cost or Return Basis.*—In the Federation Costing System all percentages are taken on cost, so that when the budget is compiled for a current year and the expenses of the preceding year are taken into the statement of cost, the handling charges would be effected on the 'cost,' and not the 'selling,' basis. The result would be an increase in the percentage figures.

"If your correspondent would be good enough to tabulate and publish his cost on the lines of those given in the articles, he would help the printing industry immensely.'

Printers and Penny Post.

Deputation to the Postmaster-General.

The Postmaster-General, Sir William Mitchell Thomson, has consented to receive a deputation from the Joint Industrial Council of the Printing and Allied Trades. The deputation will probably wait upon him towards the end of the present month.

Mr. A. E. Goodwin, joint secretary of the Council, states that they desire to place further evidence before the Postmaster-General that the trading community regard the restoration of the penny post as the most urgent service the Government could render towards stimulating trade and commerce and towards alleviating unemployment not only in the printing industry, but in the paper-making industry, the stationery trade, artists, process engravers and many other allied industries.

Mr. Goodwin points to the huge increase in the Christmas post as a hopeful sign of the readiness of the public to respond to concessions from the postal authorities, and he holds the view that the collective advertising efforts of the Christmas-card manufacturers have materially contributed to this result. The collective advertising campaign of the printing industry was specially devised to persuade manufacturers and wholesale and retail traders to issue more catalogues, booklets and advertising literature, and he believes that, with lower postal rates operating, this campaign would certainly be effective, and business generally would continue to improve rapidly.

Mr. Goodwin suggests that the recent decision of the Government to settle the claim of the postal staff by a payment approximating £2,000,000 should not affect the penny post issue. This, he points out, is a war claim, and the money should not come out of the postal revenue; but, in any event, the surplus which the Treasury has commandeered in recent years might be set against this.

The Postmaster-General has expressed his sympathy with the claims that business men have made, and the deputation from the printing trade will, it is hoped, strengthen his hands in pressing this reform upon the Treasury.

MANCHESTER COLLEGE OF TECHNOLOGY celebrated, just before Christmas, the centenary of its foundation. Amongst those taking part were the Lord and Lady Mayoress of Manchester (Mr. and Mrs. F. J. West) and the Earl of Crawford and Balcarres, Chancellor of Manchester University. The Lord Mayor, referring to the contemplated extension of the College, said that, largely owing to the efforts of Dr. Maxwell Garnett, formerly Principal of the College, some of the money had already been subscribed. Of the £120,000 which had so far been promised £60,000 had been paid, and he expected that the Corporation would be responsible for the balance. There was every prospect that Manchester would keep its lead in the field of technical education.

ONE case of lead poisoning in the printing industry is officially reported as occurring during November.

Continental Printing.

Exhibition at the London School.

A good deal of interest has been aroused by the exhibition at the London School of Printing of specimens of the work of Continental printers. As we previously mentioned in referring briefly to the exhibition, the Principal of the School, Mr. J. R. Riddell, recently made a tour of a number of Continental printing centres with a view to obtaining first-hand information as to the technical progress being made. Mr. Riddell—besides, no doubt, acquiring much useful information—has succeeded in bringing home from his travels a varied and instructive array of examples of Continental printing craftsmanship, and the exhibition of these is informative as well as interesting, for it indicates to some extent in what direction printers across the Channel are able to emulate the work of the British craftsman.

The exhibition contains examples of periodicals, general commercial printing and newspapers, the exhibits hailing from Germany, France, Belgium, Holland and Switzerland, whilst by way of contrast there are shown samples of American printing taken from the "Craftsmen Number" of the *American Printer*. As one would expect, Belgium and Holland do not stand out very strikingly in this little show, but Germany and France have some really first-class work to their credit. It is in colour work, particularly lithographic, that the best Continental printing can nowhere be excelled. In both the production and the use of types, however, British craftsmanship would seem to be ahead, and in newspaper and periodical production the general run of Continental publication seems to be far behind the ordinary British standard.

Our own impression is that, speaking generally, British and American printers can, in colour work as well as in letterpress, hold their own with their rivals in any part of the world. Continental printers, however, are working for all they are worth, particularly in the development of processes that promise to cut down costs of production. Certainly British technologists cannot rest on their laurels if they are to maintain their position. Moreover, whilst there is in German and French printing much that savours of extravagance in colour and design—and it is not advisable that extremism should be widely cultivated in this country—nevertheless British printers could profit by more fully realising that there is a place for the fantastic and daring, and that convention and custom, however beautifully followed, cannot take the place of creative art finding ever new expression through the medium of printing.

To enable more of those engaged in printing and allied trades to see these specimens it has been decided to keep the exhibition open until Friday, January 2nd.

THE latest issue of sale catalogues of the well-known firm of Barkers', Kensington, totals no less than 750,000 copies. Each catalogue consists of thirty-six pages, and the total weight amounts to 150 tons.

DIVIDENDS AND REPORTS.

BENN BROTHERS.—Benn Brothers announce an interim dividend of 6¼ per cent., less tax, on ordinary shares, payable January 1st. Last year's dividend was 5 per cent., free of tax.

ASSOCIATED NEWSPAPERS.—Interim dividend on the deferred shares for the quarter ending December 31st of 2s. per share, being at the rate of 40 per cent. per annum, less tax.

MERGENTHALER LINOTYPE.—Net earnings for year to September 30th, 1924, totalled $2,336,754, against $2,669,276 for 1922-23.

NEW COMPANIES.

EMERY PRESS, LTD.—Capital £10,500, in 10,000 10 per cent. preference shares of £1 each and 10,000 ordinary shares of 1s. each; stationers, printers, lithographers, stereotypers, electrotypers, photographic printers, photolithographers, engravers, die sinkers, envelope manufacturers, papermakers, paper bag and account book makers, box makers, cardboard manufacturers, etc. Private company. Directors: F. Drawmer, W. H. Mann and H. J. Forder.

WITCHAMPTON PAPER MILLS, LTD.—Capital £20,000, in £1 shares; to acquire, as from November 30th, 1924, the business of a paper manufacturer carried on by W. Burt at Witchampton, Dorset, as the "Witchampton Paper Mills," and to carry on the business of manufacturers of, and dealers in, paper and cardboard of all kinds, manufacturers of, and dealers in, cameras and apparatus and photographers' requirements, dealers in chemicals, manufacturing chemists, printers, engravers, bookbinders, stationers, envelope manufacturers, paper box makers, etc. Private company. First directors: H. C. Burt and A. E. B. Smith. Registered office: 46, Cherry street, Birmingham.

N.A.B.T.S., LTD.—Capital £10,000 in £1 shares; to acquire the business now carried on by H. W. Toler at 32, Duke-street, Mayfair, W., as "H. W. Bottom," and to carry on the business of newsagent suppliers, stationers, printers, lithographers, type founders, envelope manufacturers, papermakers, paper bag and box makers, cardboard manufacturers, etc. Private company. First directors: H. W. Toler and H. R. Toler.

G. E. STEVENS, LTD.—Capital £1,000, in £1 shares; to acquire the business of a printer and bookbinder carried on by G. E. Stevens, at Coventry, and to carry on the same and the business of stationers, photographic printers, envelope manufacturers, paper and paper bag makers, etc. Private company, Subscribers: W. Payne and G. E. Stevens.

AUTOMOBILE PRESS, LTD.—Capital £750, in 700 ordinary shares of £1 and 1,000 deferred shares; publishers and printers, etc. Private company. First directors: T. E. Griffiths and G. H. Bettinson. Registered office: 178, Fleet-street, E.C.

TEMSBANK PUBLISHING CO., LTD.—Capital £1,600, in £1 shares (1,500 6 per cent. cumulative preference and 100 ordinary); printers, lithographers, publishers, etc. Private company. Subscribers: C. Russell and S. A. Gibbons. First directors: A. W. Thorpe and H. Wyatt. Registered office: 21, Northumberland-avenue, W.C.2.

THOMAS BROWN (MANCHESTER), LTD.—Capital £10,000, in £1 shares; to acquire the business of a gold, silver and colour blocker, embosser, printer, and dealer in paints, varnishes, oils and other commodities now carried on at 35, Back George street and 9, Albion-street, Gaythorn, Manchester, as "Thomas Brown." Private company. First directors: T. Brown, C. V. Jarvis and R. Brown. Registered office: 35, Back George-street, Manchester.

YOUNGMAN BROS., LTD.—Capital £750, in £1 shares; to adopt an agreement with F. J. Youngman, B. W. Youngman and R. E. Youngman and to carry on the business of wholesale and export stationers formerly carried on by the above at 59 60, Old Bailey, E.C., as "Youngman Brothers." Private company. First directors: F. J. Youngman, B. W. Youngman and R. E. Youngman. Registered office: 59 60, Old Bailey, E.C.

GERALD DUCKWORTH AND CO., LTD.—Capital £25,000, in £1 shares; proprietors, publishers and editors of books, encyclopædias, journals, magazines, periodicals and other literary works and undertakings, etc. Private company. First directors: G. de l'Etang, G. H. Milsted and T. Balston. Registered office: 3, Henrietta street, Covent-garden, W.C.2.

MULTIPLE PAPER CHUTE CO., LTD.—Capital £1,500 in 1,000 shares of £1 and 10,000 shares of 1s. each; to adopt an agreement with F. R. Reynolds, and to carry on the business of manufacturers and purveyors of machines for the production of pleated or creased paper and similar products, engineers, paper and pulp merchants and manufacturers, box makers, etc. Private company. First directors: D. E. Rodwell, H. Levy and F. R. Reynolds. Registered office: 4, Edmund-place, E.C.1.

RELFE BROTHERS (1924), LTD.—Capital £1,000 in £1 shares; to carry on in Great Britain and elsewhere the business of paper merchants and manufacturing stationers, booksellers, importers and exporters of general merchandise, etc. Private company. Subscribers: B. C. Edwards, D. Edwards and J. H. Maltby. Registered office: 8, Baldwin's-gardens, E.C.

RITCHINGS AND LUNT, LTD. — Capital £1,000 in £1 shares; to acquire the business of paper merchants and agents now carried on by R. H. Ritchings and C. Lunt at 79, Silver-street, Manchester, as "Ritchings and Lunt." Private company. First directors: R. H. Ritchings, C. Lunt and J. D. Darbyshire. Registered office: 79, Silver-street, Manchester.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

JAKEMAN AND CO. (PRINTERS), LTD. (Hereford).—Particulars filed of £750 debentures authorised December 8th, 1924, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued, ranking *pari passu* with prior debentures.

F. J. PARSONS, LTD. (printers, publishers, etc.).—Mortgage dated December 11th, 1924, to secure £8,000 charged on Observer-buildings, Cambridge-road, Hastings. Holders: T. L. Ashby, Lloyds Bank, Hastings.

ENTERPRISE PRINTING WORKS, LTD. (Northamptom).—Debenture dated November 15th, 1924, to secure £400, charged on the company's property, present and future, including uncalled capital. Holder: F. Proctor, Windmill-road, Luton.

PREMIER LINOTYPING AND PRINTING CO., LTD. (London).—Debenture dated December 4th, 1924, to secure £5,000 charged on the company's undertaking and property, present and future. Holders: *Electrical Review*, Ltd., 4, Ludgate-hill, E.C.

PREMIER LINOTYPING AND PRINTING CO., LTD.—Land Registry Charge on Financier-buildings, 21-26, Dean street, Fetter-lane, E.C., dated December 11th, 1924, to secure £2,000. Holders: The *Financial Times*, Ltd.

PHOTOGRAVURE METALS, LTD. (London).—Issue on December 10th, 1924, of £200 debentures, part of a series already registered.

BURN BROTHERS, LTD. (wholesale manufacturing stationers, etc.).—Mortgage dated November 28th, 1924, to secure £1,000, charged on certain property at Hale, Ches. Holders: J. W. J. Flohr, 28, Oxford-street, Manchester, and W. H. Denham, 78, King-street, Manchester.

L. UPCOTT GILL AND SON, LTD. (printers, etc., London).—Issue on December 1st, 1924, of £2,400 second debentures, part of a series already registered.

W. AND G. FOYLE, LTD. (printers, book and print sellers, etc., London).—Satisfaction in full on November 10th, 1924, of charge dated July 18th, 1922, securing £360.

CRANES ADVERTISING, LTD. (London).—Debenture dated December 8th, 1924, to secure £300, charged on the company's undertaking and property, present and future, including uncalled capital (if any). Holder: V. L. Danvers, 42A, Underhill-road, Dulwich.

JOWETT BROTHERS, LTD. (card and bag makers, etc., Shipley).—Satisfaction in full on November 14th, 1924, of debenture dated September 25th, 1918, securing £400.

REDISALES, LTD. (stationers, etc., London).—Debenture dated December 4th, 1924, to secure £200, charged on the company's property, present and future, including uncalled capital. Holder: J. D. Taylor, St. Brendans, St. Mary's-road, Wimbledon.

RECEIVER APPOINTED OR RELEASED.

ESSEX PROCESS ENGRAVING CO., LTD. (office, London).—A. W. Hulls, of 46, Pear-tree-street, Goswell-road, E.C.1, was appointed Receiver and Manager on December 6th, under powers contained in debenture dated June 14th, 1924.

Newspaper Enterprise in Zululand

Mr. T. G. Tallantire, the proprietor of the *Zulu Times*, published at Eshowe, is to be congratulated on his enterprise in making known so prominently the resources of Zululand. We have received a copy of the "*Zulu Times* Annual, 1924," and we regard this work as an achievement reflecting the highest credit on Mr. Tallantire, and also on Mr. Walter S. Banting, the advertising and general manager. The "Annual" comprises some 120 pages, 14 in. by 9½ in., with cover printed in colour, with a centre illustration showing Zulu mother and piccaninny. The "Annual" was produced by the Commercial Printing Co., Durban, and Mr. A. S. Greenfield, the manager, is to be congratulated on the high standard attained. The "*Zulu Times* Annual" takes the form of a most comprehensive work on the resources of Zululand, particularly emphasising cane, cotton and minerals. It also deals with the history of the Zulu race and native life, and touches upon educational establishments, etc. The numerous illustrations, unique of their kind, are a most attractive feature. The *Zulu Times* and the wide interests embraced have every reason to be proud of this initial effort in bringing to the front knowledge of an interesting and very promising portion of the British Empire. To quote from the editor's introductory remarks: "We have as yet barely touched the fringe of the potentialities which lie awaiting the magic touch of capital and industry to awake them."

RECEIVING ORDER

Ruby Paterson, the wife of S. D. Paterson, residing at 16, Tontine-street, Folkestone, Kent, and carrying on business at 16, Tontine-street, and 5, George-lane, Folkestone, under the style of Paterson and Hogben, stationer and fancy goods dealer.

Zeiss Reflector Lamps.

Of real interest to the printing trade, in which lighting is of paramount importance, are the Zeiss Reflector Lamps, which are a recent introduction of the well-known optical establishment of Carl Zeiss, Jena. Their essential feature is a parabolic mirror with a silvered back; the high reflecting capacity of the mirror does not deteriorate, and a wipe with a soft cloth is sufficient at any time to clean it; a frosted convex glass front ensures a sufficient diffusion of the light so as to furnish the proper degree of genial illumination. The diffusion and intensity can be regulated within wide limits so that the lamp is adaptable to a variety of conditions.

The claim is made that, owing to the extent to which the light is turned to account, there is a saving in current consumption of generally 50 per cent. or more. The distributors are Messrs. J. W. Atha and Co., 8, Southampton-row, London, W.C.1.

Calendars, etc., Received.

MESSRS. T. G. AND J. JUBB, the well-known Leeds manufacturers of printers' metals, issue two excellent calendars. One takes the form of a daily date pad with dates very bold in red, the pad being mounted on a green card printed in white. The other, with two months to a sheet, carries a series of most amusing pictures in colour, entitled "Headlines" by Lawson Wood.

MESSRS. E. A. BRADDICK, LTD., printers' and electrical engineers, of Gough-square, Fleet-street, send us one of their very useful office calendars. A monthly tear off pad, with the dates in large red figures, is mounted on a grey board handsomely embossed in white.

MR. ROBERT B. SIMNETT, as president of the South West London Master Printers' Association, sends a greeting card which is very effective in its originality of design and straight-forward excellence of craftsmanship.

A NEAT monthly tear-off wall calendar comes from Messrs. Pavyers and Bullens, Ltd., the typefounders, of 119, Cromer-street, London, W.C.1.

FROM Sheldons Ltd., Leeds, comes an attractive card which aptly introduces, in a Christmassy snow scene, a hoarding showing Sheldons' bill-posters at work.

MESSRS. MODI AND CO., the well known Bombay printers, send a handsomely produced New Year card which emphasises the value of "true service" and which features a portrait of Mahatma Gandhi as "The Man of the Day."

SEASONABLE greetings reach us also from the Phu-Yik Press, Singapore.

PETER DIXON AND SON, LTD.—The mammoth calendar, printed on what is facetiously termed Dixon's "imitation art" paper, is to hand once more, and a very serviceable reminder of the date it is. Measuring 19 in. by 11½ in., and a separate page being given to each day, there is ample room for a bold display of the figures, which are close upon 7 in. deep.

Trade Union Matters.

TYPOGRAPHICAL ASSOCIATION COMMITTEES.—Messrs. L. P. Bristow, J. Mellor, C. Powis and W. Wesson have been appointed to act with the officials of the Typographical Association as the Finance Committee; and Messrs. T. Dove, W. H. Evans, H. J. Harvey, G. Holmes and the officials as the Rules Revision Committee.

A QUESTION OF HOLIDAY PAY.—Following representations by the Leeds branch of the Typographical Association, the Executive Council have decided to appeal against a decision of the Hours and Holidays Committee respecting a member's holiday pay. This member was engaged by a firm from January 30th until May 10th, in regular employment. On May 10th he met with an accident, which necessitated his absence from work until June 30th. On receiving holiday pay he had one day's pay deducted for the absent period, and this action had been endorsed by the Hours and Holidays Committee. The Leeds branch urged reconsideration of the case, on the ground mainly that no deduction from the holiday allowance should be made for absence for shorter periods than two calendar months, and that the member was not, as stated, a casual worker.

WAGES IN LIEU OF HOLIDAY.—The Maidstone branch of the Typographical Association have reported that a member employed by a local firm of printers had received a week's additional wages instead of taking his annual week's holiday. The Executive Council of the Association have informed the branch that such a procedure is contrary to the hours and holidays agreement, and could not be allowed.

MACHINE WAGES POINT.—The Bolton branch of the Typographical Association, who recently asked the Executive Council for a ruling on the classification for wages of a new Miehle machine capable of taking a quad-medium sheet 37 by 47, and also of embossing machines 20 by 33, 21½ by 16½ and 18 by 12, have been notified that all these machines should be placed in Class 2 of the machinemen's wages agreement.

Personal.

MR. C. W. BOWERMAN, M.P., we are glad to learn, is making satisfactory progress from his recent accident when he fell on to the railway track at Greenwich railway station. Mr. Bowerman was at the time on his way home after having delivered an address at an Auxiliary concert held under the auspices of the *Kentish Mercury*, at Blackheath Hill.

MR. BOWERMAN'S injuries are not regarded as serious, the worst being a wound on the forehead, which has necessitated several stitches. Though still confined to bed, he is going on as well as can be expected, and it is hoped will be about again in a week's time.

SIR JOHN BADDELEY acted during the Christmas holidays as *locum tenens* for the Lord Mayor of London, who spent Christmas out of town. Sir John has just passed his 82nd birthday.

MR. W. HOWARD HAZELL, J.P., contributes to the current issue of *The Times* (Trade Supplement) the first of a series of articles on "Selection and Training of Apprentices."

THE Prime Minister has accepted an invitation to luncheon at the London Press Club on Thursday, January 22nd. Mr. Edgar Wallace, chairman of the club, will preside.

SIR ALBERT STEPHENSON, the managing director of the *Southport Visiter*, has recently celebrated his 70th birthday.

MR. G. FRED LAYBOURNE, the well-known Newcastle-on-Tyne printer, who is hon. sec. and treasurer of the Newcastle Fifty Club, was presented at its annual dinner, on the 20th ult., with a silver cigarette box.

MR. M. J. CLARKE, a member of the composing-room staff of the *Daily Telegraph*, has been presented by the Companionship with a gold watch on his retirement to take up superannuation under the London Society of Compositors, of which he has been a member for 50 years.

WITH a view to facilitating his recovery from an attack of insomnia, Mr. T. P. O'Connor, M.P., has left London for a few weeks in the South of France.

TO MARK his 50 years in journalism, Mr. Harry Bone, managing editor of the *Sussex Daily News* and allied newspapers of the Southern Publishing Co., Ltd., was presented with gifts from his staff. Mr. Bone, who is 63 years of age, recently returned to the editorial chair after four months' illness.

MR. F. J. PARRETT, of Margate, and Mr. L. Shandel, of Ramsgate, have been elected by the Council as Fellows of the Institute of Journalists.

MR. TOM JOHNSTON, who re-enters Parliament as the Labour victor in the Dundee by-election, is a journalist by profession; seventeen years ago he founded *Forward*, a weekly Labour paper.

MR. SYDNEY T. SPALDING, chairman of Messrs. Spalding and Hodge, Ltd., recently left for Egypt. His visit is for both health and business reasons, and he is not expected to return for several weeks.

SIR MARK SHELDON, of Carmichael and Co., paper dealers of Australia and New Zealand, who is on a visit to Canada, says business conditions in Australia are undergoing a gradual improvement.

SIR MARK, who has had conferences with officials of pulp and paper companies, is quite confident that there will be a revival of Canadian trade with Australia.

THE paper trade in Sydney, N.S.W., has been honoured by the election of Mr. James M. Dunlop, chairman of Messrs. Dunlop and Co., Ltd., paper merchants, to the presidency of the Sydney Chamber of Commerce for the coming year.

British Industries Fair.

Great Preparations at Birmingham.

The recent decision to transfer, for 1925, the London Section of the British Industries Fair to Birmingham has met with widespread support from exhibitors and prospective trade buyers. Those who feared that the suspension of the White City Fair would leave no opportunity for the display of goods in the London schedules were gratified to learn, shortly afterwards, that mutual arrangements had been made by the Department of Overseas Trade and the Birmingham Chamber of Commerce whereby identical groups would be organised at the Birmingham Fair for all trades that had hitherto exhibited in London.

Though only a few weeks have since elapsed, many thousands of feet have been taken up, for stand purposes, by former London exhibitors, and there is an excellent letting period yet ahead. Invitations to trade buyers have been issued by the Department of Overseas Trade, as usual, all over the world, in addition to those sent out from Birmingham in respect to the industrial groups with which the Midland capital is specially identified.

Acceptances to these invitations are being received in highly satisfactory numbers as regards both the London and Birmingham Sections—now, for the first time, to be combined under one roof. These acceptances actually exceed the numbers to hand at the corresponding period of organisation for the 1924 Fair.

That is no doubt due to the fact that the British Empire Exhibition attracted to England thousands of overseas buyers who had not previously visited a Trade Fair in this country. They came from the most distant parts of the world, and were greatly impressed with the opportunities offered of examining the most modern British products, assembled according to industrial groups, and more particularly of establishing direct contact with the manufacturers at the stands. Many of these new visitors attended daily at the Fair through practically the whole period; they went over the factories where the goods are made, and placed substantial orders for products in demand in their own countries. They have been among the first to intimate their intention to visit the Fair again this year, either personally or through their accredited representatives.

Manufacturers and traders participating in the Fair recognise several advantages in combining the two Sections, for many of the industrial groups are so closely associated that it has hitherto been necessary for certain buyers to visit both Fairs. In other cases, buyers have been obliged to go to London for products which are largely manufactured in the Midland area, such as pottery, scientific instruments, leather goods of various kinds, sports goods and jewellery. On this occasion every product of British industry (except textiles and motor-cars) will be displayed at the same time and place, and the Birmingham authorities are fortunate in having ample accommodation at the great aerodrome buildings—the largest exhibition hall in the country—for the combined Fair.

Birmingham Civic Week.

The public spirit of the Midland capital in preserving the continuity of the London Section is further illustrated by a decision on the part of the Lord Mayor (Alderman Bower) and the City Corporation to hold a Civic Week during the Fair. A special sub-committee of the Birmingham Corporation is now making suitable arrangements, which include an official visit of the Lord Mayor and Corporation to the Fair, Civic Receptions of Exhibitors and Buyers attending the Fair, and invitation concerts by the City Orchestra and the Birmingham Police Band, both of which are celebrated over a wide area. In addition, prominent personages of the Midlands will give addresses on the scope and purpose of the British Industries Fair, and the Lord Mayor is issuing invitations to other municipalities to send official representatives.

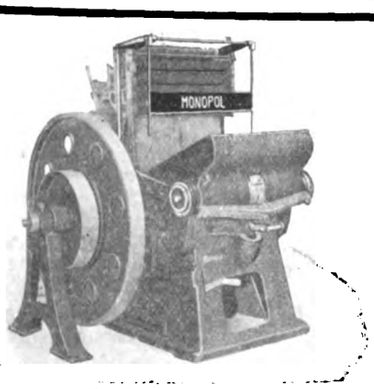
Prompt Reservation of Space is now *Essential*

Since the announcement that Birmingham's B.I.F. for 1925 is to incorporate all exhibits previously shown in London in addition to the full Birmingham Schedule already published, there has been an increased demand for space. The larger interest, the greater number of visitors that this "all in Birmingham" Exhibition will attract, mean a still wider field of business for the firms represented there. But space is becoming limited and it is therefore essential to reserve *yours* now to ensure a good position, to ensure meeting and placing your goods before Buyers from all over the world. Make your space reservation at



The British Industries Fair
Birmingham, Feb. 16 to 27, 1925

The Schedule of Exhibits includes:—

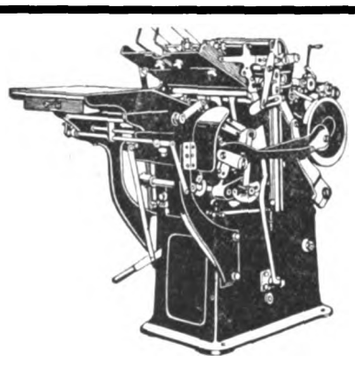
PAPER, STATIONERY AND STATIONERS' SUNDRIES AND OFFICE APPLIANCES, PRINTING, BOOKS, FANCY GOODS, LEATHER GOODS, TOYS AND GAMES, SPORTS GOODS, etc.

Send for complete information now, to ***The General Manager,***

The British Industries Fair
95, NEW STREET — BIRMINGHAM.

BUILT IN 3 SIZES.

"Monopol" Art Platen



Specially built to produce the very best Heavy Tint and Register Colour Work at a High Speed.

The Roller Carriage has a special spurwheel drive, which ensures a perfectly smooth and noiseless motion. This important improvement does away with the cam action in the main gearwheel, which is subject to great wear and necessitates frequent costly repairs.

Throw-off of Inking and Distributing Rollers from each other and from the Inking Cylinder by a single lever movement.

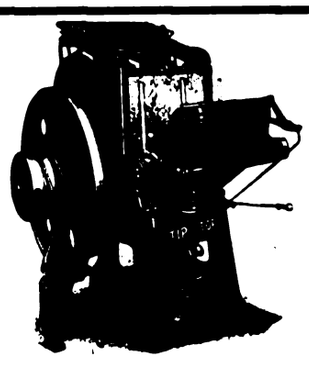
Separate Drive for Inking Rollers, permitting inking-up without running machine, or enabling the platen to be worked for embossing, etc., without the inking rollers moving.

Automatic Hand Safety Guard which can also be used as a throw-off. Only a gentle touch of the guard is required to stop the machine.

BUILT IN 3 SIZES.

"Monopol" Safety Platen

will successfully tackle 95 per cent. of your platen work, including the finest Register Colour Work, affording a handsome profit on everything it does.



Speed Range: 2,000 to 3,500 impressions per hour.

The impression is automatically thrown off in case of a misfeed.

The sheets are fed by hand to front gauges on a sloping feed board, in a similar way as on a cylinder machine.

PRINTED SIDE UP DELIVERY, each sheet being in full view of the operator.

The delivery device can be raised out of position in a few seconds to allow for easy access to the platen.

BUILT IN 4 SIZES.

"Tip-Top" Jobbing Platen

Improved inking apparatus of the latest disc type. Platen is cast in one piece and works from positive fixed centre (no cams).

Camless drive of roller carriage.

Base and vertical bed cast in one piece.

Rigid, parallel impression.

Very handy and simple impression regulator.

On the main pinion a steel section is let into the gears at the point most subject to wear during the actual impression.

Throw-off of inking rollers by simple lever action, whilst machine remains in motion.

Adjustable runners.

High speed and light and noiseless running.

Particulars can be obtained from, and a demonstration arranged by the Sole Agents:

36-38, Whitefriars Street,

Telephone: CENTRAL 3839.

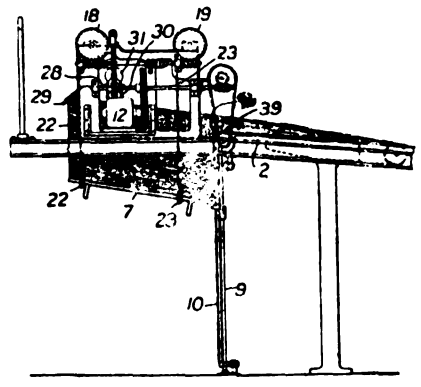
New Inventions

Registering Webs.



A mechanism for automatically controlling the feed of a previously printed and re-wound web of material to a paper bag-making or other machine as patented by Messrs. J. K. Robertson, S. Deurden and Strachan and Henshaw, Ltd., comprises a pin-carrying roller engaging holes in a web of paper or other material, means for ensuring that the

pins will enter the holes whether or not the holes occur at exactly regular intervals, and means for taking the tension off the section of the web in which the holes are engaged by the pins. In the arrangement shown, the web *a* passes from its reel *b* through the feed adjusting device to the draw rollers *c* of a paper bag-making machine. The feed device comprises three sets of rollers *e* . . *i* of which the rollers *e*, *h*, and *i* have incomplete treads, all being driven by a shaft *d* operated by a shaft on the bag-making machine. The roller *g* carries tapered pins *j* adapted to enter the holes in the web. The arrangement is such that the roller *e* intermittently feeds the paper at a slightly accelerated rate to ensure that the pins have a sufficient surplus supply of paper to adjust themselves accurately in the perforations without strain or tension, whereupon the paper is passed by the pins through the cut away portion of the tread of the roller *h*. During this period the tension of the web from the draw rolls *c* is taken by the tread of the roller *i* in engagement with the roller *g*. As soon as the tread of the roller *h* again grips the paper, the rollers *e* and *i* come out of action enabling any surplus feed of paper on either side of the roller *g* to be absorbed.

Feeding Sheets.

In this invention sheets are raised by an inclined pile table, and are fanned out over an inclined support in front of the pile guides by

means of sheet combing rolls and a driven supporting belt. The sheets are thus separated to permit of ready hand feed. As shown, the pile of sheets rests on a pile table 7 pivoted to vertically movable slides moving on guides 9, and the table 7 is raised in normal operation by two pairs of chains 22, 23 on drums 18, 19 driven by worm gearing from a motor 12. The drums 19 are driven through a clutch, and the drums 18 may be operated independently of the drums 19 when it is desired to adjust the inclination of table 7 to suit the work being operated, or to return the table to horizontal position when loading a new pile on to the table. The side edges of the sheets are guided by angle irons 10, and these are bent at the upper ends 11 to direct the sheets towards a conveyer belt 39 moving over an inclined table 2. The belt 39 is driven by a free wheel drive in one direction only by worm and chain gearing from the motor 12, and the belt 39 is moved faster than a pair of combing wheels 30, which are driven by a separate motor 31. The combing wheels are mounted so that they can be adjusted horizontally on a bar 28, which is vertically adjustable by screws, and this bar 28 carries a pair of inclined guides 29, which direct the top sheets towards the table 2. The patentee is Mr. B. F. Berry.

A MEMBER of a well-known family of paper-makers has passed away in the person of Mr. Laurence Green, the third son of the late Mr. John Barcham Green, of Maidstone. The deceased gentleman, who is a brother of Mr. Herbert Green, was 67 years of age and was the proprietor of Messrs. Henry Allnutt and Son, Lower Tovil Mill, Tovil, Maidstone, manufacturers of white and coloured cheque papers, antique and marble cardboards and printings, machine-made crayon papers, tub-sized samplings and self blue papers, chemical and commercial filter papers, etc. The mill has one machine 60 ins. wide. The service at All Saints Church, Maidstone, preceded the interment on Thursday, December 18th.

PLAYING cards were invented by the Chinese 800 years ago. The kings represent real heroes of history and the queens are Greek, Sicilian, and two Biblical ladies.

Wholesale Stationers and Paper MERCHANTS.

Twenty-First Birthday of the National Association.

It is interesting to note that the National Association of Wholesale Stationers and Paper Merchants has recently attained its twenty-first birthday. In celebration of its majority, the Association has issued an attractive brochure, which is tastefully printed and got up. The cover bears the embossed badge of the Association, picked out in gold, while the contents, which specify the various services rendered by the organisation, have their titles on each page printed in red, which makes a strong contrast with the rest of the printed page.

In describing the twenty-one years of practical work, the brochure mentions that the first effort to safeguard the interests of wholesale stationers and paper merchants was in 1903—due to the energies of Mr. Arthur V. Hunt and Mr. Evan Spicer. As our readers may remember, in 1918-1919 similar associations were formed in Manchester, Birmingham, Leicester, Nottingham and Bradford, and these were eventually brought together in 1920 in the National Association of Wholesale Stationers and Paper Merchants, under the presidency of Mr. H. G. Spicer. To day, it is stated, the Association includes most of the principal houses; has received a vigorous injection of fresh blood; and is energetically working to extend the membership and to bring about far-reaching reforms for the general benefit of the trade.

In a circular letter accompanying the booklet, Mr. C. J. Thorn, secretary of the Organisation Committee, calls attention to various items in the programme of the Association. He introduces his letter by saying that "margins in paper handling are far too small today and nowhere are proportionate to the heavy standing charges with which we are faced. It is essential that all paper merchants should seek a sounder trading basis" According it is emphasised that if those concerned agree with this statement and wish to put an end to "the ridiculous competition between mills, agents and jobbers for the legitimate trade of the wholesale stationers and paper merchants," they must realise that united action is imperative. Such united action of the wholesale stationers and paper merchants of the country, it is added, will command results. The aim is to enroll every paper house in the Association, and the letter addresses each recipient as follows: "We want *your* firm to join."

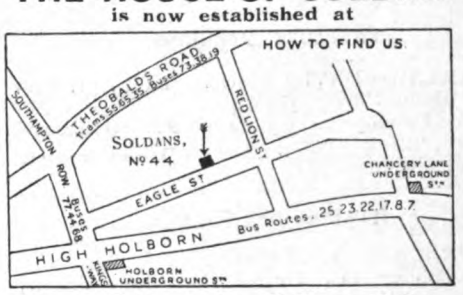
The Right Distributor.

As already observed, the brochure outlines the programme of the Association, and special attention is drawn to matters of definite business interest to wholesale stationers and paper merchants. Mention is made in the first place of negotiations now in progress with home and foreign mills, to regularise the handling of paper from the mill to the customer.

"It is most important," in the words of the brochure, "that the wholesale stationer and the paper merchant be recognised by the mills, both home and foreign, as the right distributors of the mills' products to the retailer—and that the mills shall not sell direct to the printing house, retailer or consumer."

Reference is then made to the strong deputation from the Association which attended a conference last summer with the Swedish, Norwegian and Finnish mills, and a return conference will shortly be held in London to complete the negotiations. There is every prospect of concluding trade customs and regulations which will be of the greatest value, it is stated, more particularly to those interested in wrappings; and in order to bring these negotiations to a satisfactory conclusion, it is absolutely essential to have the support of the whole of the trade.

Negotiations have also been concluded with the Federation of Master Printers to regulate the supply of paper to the user, and to establish the principle that the paper merchant be regarded as the legitimate channel of distribution from the mill.



The British mills are strongly organised; the colonial and foreign paper agents have seen the modern necessity for mass organisation, and the Wholesale Stationers Association needs to be just as powerfully consolidated in order to safeguard the interests of the wholesale stationer and paper merchant.

The next matter to which attention is drawn is the formation of a court of arbitration, the foundations of which have already been laid, which will be available to all members at a purely nominal cost for the settlement of claims and disputes.

Other matters referred to are the paper trade customs which were established in 1906 by the Association in conjunction with the Papermakers' Association and which have since been revised, and the negotiations with the shipping and railway companies with a view to bringing about an easier and cheaper handling of paper, and the work of the Inquiry Register and Debt Collecting Dept., which, covering the whole of the country, is being further developed.

These are some of the directions in which the activities of the Association have run, and with fuller support it is felt that still further useful service can be rendered to the whole trade.

LOVE'S PAPER RECOVERY MACHINE.

Patented (No. 144485) by Joseph Love.

THIS Machine has been invented for the purpose of speedily recovering the small quantities of paper left on centres or spools which are thrown out from Printing Machines, etc. (commonly known as "Reel Ends"), so that it may be cut into suitable sizes by the Guillotine.

CHIEF ADVANTAGES:

1.—No spindles, bars, or cones are required, the reels being kept in position by a patent spring device thus saving time and labour in loading and unloading.
2.—It occupies a space of only six feet on the run, and is quite noiseless.
3.—The power required is such a small amount that it can be driven from any existing shafting.
4.—Centres of any kind or width can be worked on the machine
5.—It can be run at the high speed of 500 feet per minute, and will recover approximately 3 tons of paper per day.
6.—It can be constructed to suit all requirements in the off-cut trade, and is equally valuable to Printers or in Paper Mills.

MACHINES SUPPLIED FROM STOCK.

Graphic Arts Buildings and Craftsmen Clubs.

Important American Printing Movements.

By B. N. FRYER.

Most large cities in America have a modern building devoted to printing and allied trades, and a great number now boast "Craftsmen Clubs." Although these evidences of development in the printing world are absolutely separate and distinct in origin and in aim, their growth side by side indicates a similarity of spirit animating printers' activities. There is much of the co-operative element in them.

Graphic Arts Buildings are merely the working rendezvous of printers. They are especially erected and dedicated to this fraternity. A printers' architect plans the building, which is the last word in suitability to purpose, and at times is handsome as well, although the æsthetic aspect is a later development. Constructional requirements for efficient working conditions have been the main considerations. Strength in the machine rooms, ample light for compositors, utilisation of space, convenience of departments, have been guiding principles. The result is that it is a pleasure to work in these roomy, airy, clean, well-lighted and comfortably kept places. Hitherto, they have been somewhat plain in construction, but they are beginning to take on exterior adornments, following the lead, doubtless, of the latest types of individual printing offices where the proprietor and the architect have collaborated to plan something expressive of the place and its ends, and mayhap embodying personality.

A Home for Specialists.

The Graphic Arts Building is essentially a home for specialists, yet there is place also for the general printer, or even several of him. It is, however, more peculiarly suited to purely machine shops doing press-work for the trade only, for trade composition plants, bookbinders, and specialised branches of printing. It might be emphasised that trade ethics require the better-class printer to recommend his brother printer for the job he cannot handle himself. While the Graphic Arts Building is generally close to a town centre, individual printing offices have a tendency to seek the outer purlieus of cities, rents for one thing and motor cars for another thing being causative factors; the more individual the office the farther it can go in search of ideal conditions. Within limits, trade follows the man.

The Craftsmen Clubs that are springing up throughout the United States and Canada (and there is one in South Africa) are a printers' rendezvous after the day's work. They are educational in complexion, based on the motto of "Share your knowledge," the purpose being to enable members prepare for future work. Originally, the clubs were small gatherings of superintendents, overseers, and foremen, from different establishments in some Eastern states, who met to discuss working problems and help each other solve executive and administrative difficulties. In this they were patterned on the model of a London guild. These early and at first rather informal meetings grew in size and multiplied, reaching from city to city, until a need for organisation made itself felt. Then came the International Club of Printing House Craftsmen, with its now well-known emblem, the Fust and Schœffer printers' mark, two shields, with a heraldry that is in dispute, pendant from a bough of a tree.

Promoting Exhibitions.

To begin with, the club was one almost purely given over to the threshing out of problems of management, with occasional talks by experts from allied trades. The last year or two, however, the international body has taken interest in and management of the periodical exhibitions that the printing and allied trades hold in different localities. This useful function is developing a rotation through the States, and cannot but be beneficial to the industry by preventing overlapping while covering all territories, reducing the number of haphazard displays and saving considerable outlays by printers' supply houses. This work has scotched for all the trade a growing octopus-like "overhead."

Always injecting new ideas into established procedures, the West-shaped Craftsmen Clubs evolved along somewhat new lines when the movement reached the Pacific coast. Among the first interested in San Francisco were several decided typographers, and the names of Henry Nash, the Grabhorn Brothers, Hartley Jackson, Hayward Hunt, the Kibbees, Beran, Johncke, and Kennedy, and others of that coterie whose work attracts widely spread attention and has lifted San Francisco to a typographical pedestal, are to be found on the list of active workers. Their impression on the movement covered all the West Coast, each succeeding club following the example of throwing membership open to employer and employee, in all sections of the industry, and in making typographical features of their monthly announcements, and, as in San Francisco and Spokane, of the club journal.

The San Francisco club has turned out some striking pieces of work. On occasion, craftsmen have been given the run of some well-equipped office, and apprentices and enthusiasts give Sabbath and holiday hours to composing, laying out, setting, and printing meeting notices. Considerable thought is given to all details, and the results frequently draw remarks from trade journals and are sometimes reproduced in Eastern papers. This club aims to install a £5,000 printers' library.

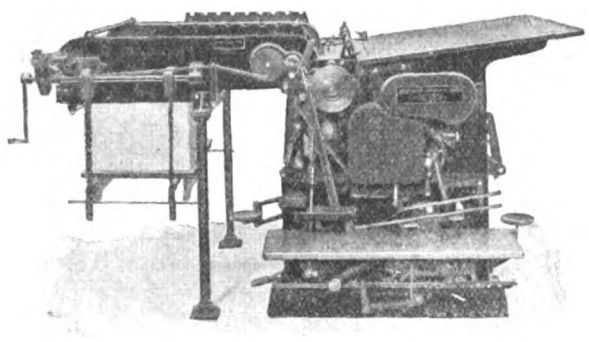
Gems of Craftsmanship.

A pleasant little activity illustrative of the spirit has also grown up in interchange of seasonal cards, unique and exclusive in get-up, and full of character. There are the grave and the gay, the charming and the puckish—those displaying the hand of the technician, those with free sprightliness and those broadly comic, but all telling of the interlude when the designer throws all his heart into the job. A craftsman in a Graphic Arts Building can "let himself out" on these souvenirs.

Los Angeles club, partly by well-directed energy and partly by happy circumstance, has been able to have a printers' room set aside in the city's new library, to which members have contributed a bust of Benjamin Franklin, patron of American printers. This club also has the wonderful good fortune to be close to the famous Huntington library at Pasadena, treasure-house of priceless incunabula and a fine typographic section.

The public librarian at Spokane, Washington, an enthusiastic bibliophile possessing a splendid lot of typographic books, helped to sponsor the local club, and naturally his aid is of consequence to the men seeking to turn out better printing.

This phase, an outcrop of a current renaissance, bids fair to become more and more important in international activities. Each exhibition finds it getting more recognition, more wall space; in each series of lectures it is more often dealt with; indeed, the Western impulse gives promise of adding a dynamic keynote to American commercial printing.



Viewed broadly, it would seem as though Graphic Arts Buildings and craftsmen clubs are components of the same urge, and complementary. There is no doubt that both

J&M

OFFSET LITHO ROTARY

WITH PILE DELIVERY.

FEED SIDE OF THE J&M OFFSET LITHO ROTARY WITH PILE DELIVERY.

This is a two-revolution press—a very desirable feature in a machine for colour printing in dead register. The printed sheets are delivered face up on the pile clear of the machine at a convenient height for examination. The plate cylinder is of large diameter, which facilitates perfect inking, damping, and manipulation of the plate. The damping mechanism is placed below the plate cylinder, so that splashing of water does not affect any other part of the machine. The ink distribution is highly efficient. A combination mechanism automatically trips the impression cylinder, inking rollers, ink-ductor, and water-ductor rollers. The machine attendant can fully control the press without leaving his seat.

It is built with Pile Delivery, but can be supplied with an ordinary delivery board if desired.

This Offset Press is built in three sizes:—

Machine No.	Size of Sheet.	Size of Design.
	in. in.	in. in.
No 1	37½ x 52	37 x 52
No. 2	33½ x 45½	33 x 45½
No. 4	25 x 37	24¾ x 37

LINOTYPE & MACHINERY LTD.

9 KINGSWAY, LONDON, W.C.2

movements lead to the better acquaintance of one printer with another, and, because of more intermingling and more general diffusion of knowledge, tend to bring about co-operation and understanding both inside offices and between firms, to the betterment of the industry.

Britain's Greatest Trade Fair.

Lord Mayor's Call to Industry.

The fact that the British Industries Fair for 1925 is the first occasion on which the whole of the industries are enabled to display their products at the same time and place—actually under one roof—is regarded as of outstanding importance to British manufacturing interests. It establishes a close parallel with Continental Fairs such as that of Leipzig which, founded a century ago, has long been an international institution. In these circumstances, the Lord Mayor of Birmingham, who is inaugurating a Civic Week of Trade Carnival to coincide with the Fair, has just issued a special appeal to the individual British trades. In the course of a letter addressed to ourselves, his lordship observes:—

"The Fair which will be held at the spacious Exhibition Buildings at Castle Bromwich from February 16th to 27th next will be the greatest and most representative that has ever been held. Annual trade fairs promoted by commercial and public authorities, have become recognised as permanent institutions in, and invaluable adjuncts to, the trade of the principal countries of Europe, and it is the aim of the promoters of the British Industries Fair that this also shall be permanent. The object of annual trade fairs is to promote international trade, and it is undoubted that the result which accrues from them is highly beneficial to the manufacturing communities in the countries in which they are held.

"The British Industries Fair (Birmingham) was inaugurated in 1920 under the auspices, and with the support of, the Municipality and the Department of Overseas Trade. Here exhibits were representative of the heavier trades of the country, including engineering, metals and others. The dates of the Birmingham Fair coincided with those of the London Fair organised by the Department of Overseas Trade, where the exhibits included leather goods, toys, fancy goods, paper, printing and stationery.

"Every possible effort is being made by the Corporation of Birmingham, and the Birmingham Chamber of Commerce to make the forthcoming Fair worthy of the many important national industries. It is imperative, therefore, that the manufacturers of Great Britain should give to the Fair their hearty support. There are evident signs of an upward movement in trade, and the progress which is now being experienced cannot fail to be accelerated by the Fair, which will be visited by many thousands of buyers who will come into direct personal contact—in most cases for the first time—with the actual manufacturers of the goods in which they are concerned."

Australian Notes.

Libel Actions — Trade Union Matters — Photo-Engraver's Death — Journalism at University.

(From Our Sydney Correspondent.)

In an action brought by Emanuel Myerson, property owner, against *Smith's Weekly*, Ltd., for alleged libel, in which the jury awarded Myerson one farthing damages, the case being afterwards taken to second trial and appeal, it is calculated that the total costs of the litigation will amount to between £6,000 and £7,000 for each side, or between £12,000 and £14,000 altogether.

On behalf of Mr. Roy N. Connolly, formerly editor of the *Labour Daily*, there has been issued out of the Supreme Court a writ against the *Labour Daily*, Ltd. Damages are claimed to the amount of £2,000.

An application by the Amalgamated Printing Trades Employees' Union of New South Wales for re-registration was heard recently in the Industrial Court. It was unsuccessful. The application was objected to by the secretary of the New South Wales Master Printers' and Connected Trades' Association, who stated in an affidavit that the applicant union had been de-registered on April 27th, 1923, on the ground that it had committed acts in the nature of a strike, and had since been fined by the Court for having taken part in, or having aided and abetted, an illegal strike.

The Judge was inclined to be favourable to the Union's application, until it was submitted, on behalf of the objecting employers, that the Union was not worthy of re-registration, as certain resolutions that had been adopted by the Union subsequent to its de-registration showed that the Union was inciting to illegal action in the matter of arousing opposition to legal awards of arbitration.

Mr. Sydney W. Bacon, managing director of S. W. Bacon and Co., Ltd., a well known business man, and one of the foremost photo-engravers in the Commonwealth, died recently. Mr. Bacon was an enthusiastic yachtsman, and in accordance with his wish his remains were sent to Melbourne for cremation, and upon the return of the urn containing the ashes it was buried at sea.

"Journalism must be considered a profession. What has been done elsewhere must sooner or later be done here — that is the establishment of a chair of journalism at the University," said Mr. C. Brunsden Fletcher, president of the Journalists' Institute, in a deputation to the Minister for Education, who expressed his general sympathy with the proposal.

Edwards Dunlop & Co. (London), LIMITED.

On Wednesday, December 24th, the staff of Messrs. Edwards Dunlop and Co. (London), Ltd., and their friends, enjoyed another of the Christmas parties which owe their origin to the kindly thought of Mr. J. C. Heighway, the managing director of the firm. Most of the staff were in fancy dress, and the Recreation Room presented a brilliant scene, being tastefully decorated with paper chains, as well as an abundance of holly and mistletoe, whilst in a prominent position stood a large and gaily-decked Christmas tree, from which in due course each member of the staff received a present.

Shortly after 3 p.m., the proceedings commenced with an excellent repast, generously provided by Mr. Heighway, who presided over the festivities, and at a suitable interval between the items, which, of course, included the ubiquitous turkey and plum pudding, Mr. A. G. Taylor (secretary) voiced the thanks of the staff to Mr. Heighway, remarking that he (Mr. Heighway) not only bore the expense, but also worked very hard himself in the preparations for the entertainment.

Mr. Heighway was then presented with a small memento of the occasion in the shape of a silver desk clock, and the toast of his health having been enthusiastically honoured and endorsed with "three times three," he made a brief response, in which he expressed his great pleasure at seeing his "family" so thoroughly enjoying themselves. He hoped they would continue to add to their numbers, and that all those present would be with him for many years to come. He then read a number of cablegrams conveying the good wishes of their friends on the management and staff of Edwards Dunlop and Co., Ltd., Sydney, Melbourne and Brisbane.

Later in the evening an audience numbering about seventy were treated to a first-rate entertainment produced entirely by members of the staff.

Space will not permit of a detailed report, and where all the items are excellent it is difficult to select. Special mention might, however, be made of the sketch "Whose Husband Are You?" which was deservedly applauded as a remarkably fine performance. The outdoor staff, who adopted the significant title of "The Trotters," were responsible for several jolly numbers, as well as for some well-rendered sentimental songs.

Altogether, the concert was held to reflect the utmost credit on the amateur performers, and Mr. Heighway, who received an ovation when he appeared on the platform at the conclusion, declared that he was proud of his staff, who had shown that they could play as well as they could work—and the audience could take his word for it that they could and did work. (Applause.)

After "Auld Lang Syne" and the National Anthem, the happy gathering broke up, with pleasant memories of a most enjoyable Christmas Eve.

Archibald and Co. are now located at their new and spacious premises, 60, Carter-lane, E.C.4; Telephone No.: City 2296 and 2297. In addition to fresh warehouse accommodation at 60, Carter-lane, they are keeping on their warehouse at 4, Evangelist-court, and so will be able further to increase the range of their stocks.

Trade Notes.

To celebrate the opening of new premises by Watford Printers, Ltd., a Labour and Co-operative printing works at Vicarage road, Watford, Herts, a dinner and social gathering is to be held in the Trade Union Hall, Woodford-road, Watford, to day (Thursday).

WE understand from Mr. Edward Crone, the South of England representative of the Victory-Kidder Printing Machine Co., Ltd., of Birkenhead, that the London headquarters have been removed from 66, Houndsditch, to more convenient offices in Blackfriars House, New Bridge-street, E.C.4. Telephone No. City 1050.

OWING to the continued development of their business, the *Liverpool Post* and *Echo* have once again found it necessary to secure increased accommodation. They have acquired two adjacent buildings.

BOOKBINDERS' OVERSEERS ASSOCIATION.—Important questions concerning the Association's future policy regarding the sum to be paid to unemployed members were under consideration at the monthly meeting on Tuesday at St. Bride Institute. Though the Association's rules in respect of unemployment benefit have worked quite well in the past, they are now considered by many of the members to be inadequate to meet the conditions of the present time. A good deal of difference of opinion appears to exist amongst the members as to whether or not the Association should go forward with a bigger policy of unemployment benefit. In reference to this question several suggestions have been made, which are to be placed before the members at the annual general meeting next month to be finally dealt with. A report of Tuesday's proceedings will appear in next week's issue.

IN connection with the celebrations, attended by the Prince of Wales, in London on Tuesday, in commemoration of the founding of Guy's Hospital 200 years ago, it is interesting to recall that the founder, Mr. Thomas Guy, began his career as a bookbinder's apprentice.

A COMBINED meeting of the North London Master Printers' Association and the East and North East London Master Printers' Association will be held at Granger's Restaurant, 550, Kingsland-road (one minute from Dalston Junction Station) on Tuesday next, January 13th at 7 p.m. sharp, when Mr. J. D. Wise will speak on "How to be Happy though a Printer."

LONDON SCHOOL OF PRINTING.—A new term at the London School of Printing has commenced this week, and special courses of instruction in costing, estimating, salesmanship, photo-lithography and offset are being formed. Prospective students should make early application for enrolment, as it is usually difficult to get a place in these classes after the term commences.

"IT PAYS TO ADVERTISE" is the heading of an effective full page advertisement which appears on the front of the January 2nd issue, a special enlarged number, of the *North Cheshire Herald*, serving to draw attention to the power of print in general and the effectiveness of this well produced provincial newspaper in particular.

PUBLISHED by Herbert Morrison for the London Labour Party, and printed by The London Caledonian Press, Ltd., 74, Swinton-street, Gray's-inn-road, W.C.1, the *London News*, the new organ of the London Labour Party, publishes in its January issue a blessing from Mr. T. E. Naylor, M.P. (secretary of the London Society of Compositors), who also contributes a long article setting forth the progress made by the Labour Party in London Politics.

THE annual dinner of the Newspaper Workers' Club, to be held on Saturday, January 17th, at the Lever House Restaurant, Blackfriars, promises to be an important and successful function. The chair is to be occupied by Mr. W. A. Rodford (president), whilst the musical programme is a very varied and lengthy one. Amongst those on the toast list are Mr. C. W. Bowerman, M.P., Mr. T. E. Naylor, M.P., Mr. S. W. Newcombe, Mr. R. Baker, Mr. W. A. Rodford and Mr. T. Timberlake.

IN *The Times* on Saturday, a copy of the first issue of the *Daily News*, edited by Charles Dickens, dated January 21st, 1846, was offered for sale.

WE regret to record the death, which occurred suddenly at Torquay last week, of Mr. W. H. Smythe, until recently a partner in the photo engaving house of A. Bourne and Co., Ludgate hill.

THE death has occurred at Bath, at the age of 59, of Mr. G. Stanley Philip, who retired some 18 months ago from the position, held for many years, of chairman and general manager of Messrs. George Philip and Son, Ltd., map publishers. He had been connected with the business for over forty years, both before and after its formation into a limited company, and his death will be much regretted by all with whom he came into contact, both in his private and business relationships.

FOLLOWING the death last Thursday, at the age of 80, of Sir F. C. Gould, the celebrated cartoonist of *Westminster Gazette* fame, the funeral took place on Monday in the village cemetery of Porlock, near Minehead, many London friends being present.

THE late Mr. Henry Godfrey, of Hythe Kent, chairman of Messrs. John Dickinson and Co., Ltd., Old Bailey, E.C., and of Messrs. Millington and Sons, Budge-row, E.C., left £77,530.

MEMBERS of the London Press Club on Saturday night gave their annual children's party, and 150 boys and girls present enjoyed themselves immensely.

Trade Union Matters.

THE Printing Machine branch of the National Union of Printing, Bookbinding, Machine Ruling and Paper Workers gave unemployed members of the branch Christmas parcels containing joints of meat, ingredients for Christmas puddings, fruit, etc., and toys for the children.

HOLIDAY WAGES POINT AT CARDIFF. The secretary of the Cardiff branch of the Typographical Association has reported to the Executive Council that some members who were employed on a double shift in a local office only received payment at the ordinary day rate for August Bank Holiday, the firm having contested the claim of the men for payment at the rate ordinarily received for a day's work, *i.e.*, 'stab rate or amount ordinarily received in respect of early or late shift. The Executive Council decided to refer the case to the Hours and Holidays Committee.

T.A. HEADQUARTERS. — The Executive Council of the Typographical Association have had under consideration the report of the auditors for the half-year ended June 28th. The Council decided to make inquiries of the income-tax authorities regarding the liability to property tax and house duty. Regarding the depreciation of "Beechwood," the Association headquarters at Manchester, it was decided that depreciation at the rate of 1 per cent. should continue, but that the matter be reconsidered at a later meeting. The balance of £12 4s. 2d. excess of income over expenditure at "Beechwood" for the half-year will be placed to the credit of the superannuation fund. The auditors' report was accepted, and they were thanked for their services.

New British Patents.

For the benefit of our readers we have arranged for any inquiries relating to Patents, Designs and Trade Marks to be answered, free of all charge, by a Fellow of the Chartered Institute of Patent Agents. Inquiries should be addressed, in the first instance, to the Editor.

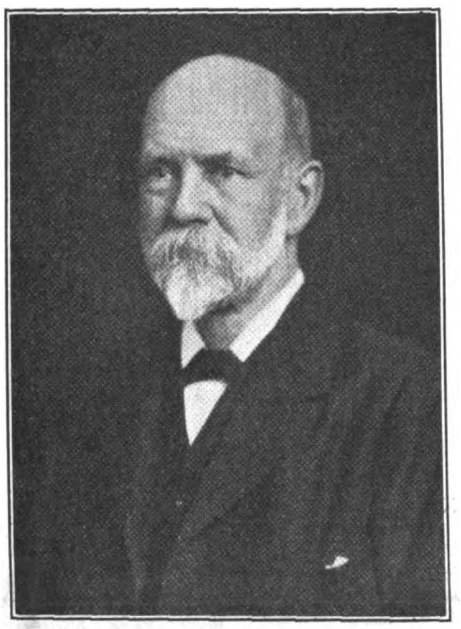
Stationers' Social Society.



Satisfactory Progress Reported at Annual Meeting.

The annual general meeting of members of the Stationers' Social Society was held on Tuesday last week at Anderton's Hotel, Fleet-street, with Mr. M. Relph, the retiring president, in the chair.

Election of President.

The chairman said the committee had given close consideration to the question of the next president. He thought the committee had been extremely wise in asking Mr. Newell to be their president, and he (Mr. Relph) had very great pleasure in proposing his election.

Mr. Cayzer seconded with very great pleasure, and the resolution was carried unanimously and with hearty applause.

Photo, H. J. Whitlock & Sons, London.

MR. CHARLES NEWELL.

After Mr. Relph had described Mr. Steele as "a treasurer of treasurers," Mr. Porteous proposed the re-election of that gentleman, whose work in the past two or three years, he observed, had been invaluable.

Mr. Weeks seconded the proposition, which was carried with enthusiasm.

Mr. Relph, in proposing the re-election of Mr. Mist as honorary secretary, said for twelve months he had an opportunity of witnessing the amount of work which their secretary had to undertake, and he was confident that no man could have laboured more diligently and faithfully than Mr. Mist had done.

Mr. Iago seconded the resolution, and Mr. Mist was unanimously re-elected.

Mr. Mist acknowledged this further token of the Society's confidence in him, and, intimating that he thought it was the secretary's privilege to nominate an assistant, he said he had very great pleasure in putting forward the name of Mr. Jesty, who had already acted as his assistant with very great willingness, courtesy and fidelity.

Major Craster seconded the nomination of Mr. Jesty, whose election was unanimous and cordial.

The Committee.

The next matter to engage the attention of those present was the election of the committee.

Nominations were then received and the following were declared elected:—Messrs. A. E. Brown, Chas. Davidson, E. Ferguson, E. Green, J. W. S. Johnston, P. W. Kennett, L. C. Lewsey, G. E. Oswick, P. S. Porteous and G. S. Weeks.

By securing Mr. Chas. Newell as their president for the current year, the Stationers' Social Society have selected a gentleman who is both widely known and highly popular in the paper trade.

Mr. Newell's record in paper circles is one of no mean order. Now in his 69th year, he began his business career close upon half-a-century ago with Messrs. A. M. Peebles, with whom he spent twenty years. One of his colleagues in that firm was the late Mr. John Gordon; and both gentlemen leaving Messrs. Peebles together, they set up in business on their own account, under the style of John Gordon and Co. Under the able direction of Mr. Gordon and Mr. Newell, the business prospered and came to represent some of the best mills in the country, manufacturing a wide range of papers.

Calendars, etc., Received.

FROM Messrs. Slater and Palmer, of 4, Wine Office-court, London, E.C.4, comes a monthly tear-off calendar which serves well to popularise "S. and P." inks by exhibiting various attractive colours and colour-combinations which specified inks will produce. The tear-off sheets are printed in different colours, and are perforated to reveal from the back six varieties of named inks. The printing demonstrates the suitability of these colours for both half-tone and solid work.

MESSRS. SLATER AND PALMER send also a neat weekly tear-off diary pad which will serve a useful purpose in many a busy office in the printing trade. Each sheet carries a month's dates, and two years' dates, together with postal information, are given at the back of the pad.

THE distinctive features of the annual calendars issued in recent years by Messrs. Perkins, Bacon and Co., Ltd., are again to the fore in the one for 1925, which has just reached us Specialising as they do in the printing of stamps, bank notes, share warrants, debentures, steel plate engraving, etc., this calendar well exemplies the ability of this establishment to execute work of a special kind. It is ornamented at the top and the two sides in red, the design being most elaborately and delicately executed. Centred at the top of the design is a portrait of King George printed in black. Use is made of a substantial board measuring 17½ in. by 14½ in., which is appropriately finished with a framework in grey, giving the pleasing appearance of leather, whilst there is a handsome hanging-cord of the same colour.

MESSRS. BAILEY BROS., LTD., the wholesale bookbinders, of Ronalds road, Highbury, N.5, have issued a monthly tear-off calendar mounted on leatherette board, blocked in gold, and enhanced with two half-tone illustrations showing respectively a group of Bailey-bound books and a view of the firm's factory.

FROM John T. Marshall (John T. Hircock, proprietor), engineers to bookbinders, printers, boxmakers and allied traders, of 36, Powell-street, London, E.C.1, come two artistic monthly tear-off calendars. One bears a reproduction in colours of a painting of the New County Hall by A. de Breanski, the picture being tastefully framed in grey on a white mount. The other has as its chief feature a vase of pansies, the brilliant colouring of the flowers being well reproduced.

WE acknowledge with thanks a copy of the "Printers' and Stationers' Year Book and Diary" (*Caxton Magazine*, Avenue-chambers, 4, Vernon-place, Southampton-row, W.C.1). Measuring 11 ins. by 8½ ins., and produced in stout paper boards, the 1925 issue of this annual is well adapted to be of real practical value to the printer or stationer. Besides over 50 pages of writing paper ruled as a diary, six days to a page, the book provides a mass of useful reference matter, including a comprehensive directory of trade associations and several pages of paper data. The price to non-subscribers is 5s.

MACAIRE, MOULD AND CO., LTD., Mountview Press, Crouch End, have once more issued a very useful calendar. This year the dates for each month are clearly printed in blue on a large sheet ruled in red, and the appearance, together with the artistic design, makes a serviceable ornament for any office. This firm of artists, designers and printers have also presented their friends with a weekly memo. pad made up of good paper and with appropriate space for engagements. The dates for the whole month appear on the top corner of each sheet for reference purposes.

A LARGE monthly tear-off calendar comes from Messrs. E. R. Alexander and Sons, Ltd., letterpress, lithographic and music printers, etc., of Leyton. Printed in three colours on tinted paper, each sheet—which carries not only one month's dates in large legible figures, but also the other eleven months' dates in miniature—conveys a good impression of the varied and high-class services this well-know firm can offer its clients.

From the London Gazette.

PARTNERSHIPS DISSOLVED.

Ann Walker and F. Hulme, manufacturers of printing inks and materials and varnish, dealers in printing machinery and materials, and printers' valuers, at Vicarage street, Wakefield, York, under the style of G. and F. Milthorp.

R. Nigh and A. H. Mawer, wholesale stationers, 146, Leighton-street East, Croydon, Surrey, under the style of Dinham and Nigh.

THE BANKRUPTCY ACT, 1914.

RECEIVING ORDER.

Peerless Advertising Service (a firm), 8, Station-road, Finsbury Park, advertisers. Public examination, February 17th, at Bankruptcy-buildings, Carey-street.

Yadil Press, Ltd.

Creditors and shareholders of Yadil Press, Ltd., met in London on Tuesday, and agreed to leave the liquidation of the company in the official receiver's hands.

The liabilities were stated to be a little short of £20,000, and creditors on present figures would only get about 10s. in the £, so there could not possibly be anything for the shareholders

Mr. Oswald Earp, M.A., said the failure of that company was due entirely to causes outside the management, and he could advance what he regarded as solid reasons for thinking that, though the claim for damages against the people who attacked the proprietors of "Yadil" might not be feasible at the moment, it would become feasible in the future.

Mr. Earp stated that arrangements were being made to form a new company.

Death of Lord Doverdale.

The death occurred on Monday, at the age of 88, of Lord Doverdale, formerly Sir Edward Partington, who was connected with Olive and Partington, one of the great papermaking businesses of the country, with mills at Glossop and other towns. He was born at Bury, Lancashire, and began work when a lad in a paper mill at Bridge Hall, his education being gained largely in a night school. During the war he showed the possibility of making paper from wood grown in this country. He had several times been Mayor of Glossop, and for many years president of the Papermakers' Association of Great Britain. He was raised to the peerage in 1916.

He is succeeded by his only surviving son, the Hon. Oswald Partington, a former Junior Lord of the Treasury, who was born in 1872.

London School of Printing Social.

At the staff dinner of the London School of Printing on Saturday last, 100 members of the staff and their friends met to spend a social evening at the Connaught Rooms. An interesting speech was made by Mr. H. L. Bullen, who proposed the toast of "The London School of Printing," and this was replied to in characteristic speeches by the Right Hon. Lord Riddell, president of the school, and Mr. T. E. Naylor, J.P., M.P., vice-chairman of the school. Mr. W. Howard Hazell, J.P., chairman of the school, in an inspiring speech, proposed the toast of "The Staff," which was responded to by the deputy principal, Mr. J. Fuller. Mr. R. G. Radford proposed the toast of "The Visitors," and Mr. T. W. McAra, J.P., secretary of the Newspaper Proprietors' Association, and Mr. Alfred Langley, president of the London Master Printers' Association replied. The toast of "The Stewards," was proposed by Mr. W. J. Pincombe, J.P., L.C.C., Mr. L. C. Mennell replying. An excellent musical programme was arranged by Mr. Herbert Townsend.

THE police visited, on Friday, the editorial offices of the newspapers *Tokseur* and *Orient News*, Constantinople, and notified the managements that the papers were to be temporarily suspended as the result of an order received from the Angora Government.

THURSDAY, JANUARY 8, 1925.

Trade Optimism.

IT must be highly gratifying to business men everywhere to observe the markedly optimistic tone of many recent utterances of leaders of trade and industry. Those who have their fingers on the pulse of commerce seem confident that 1925 is going to see increased business and decreased unemployment as compared with the year just ended. To take only two citations, chosen more or less at random, from the daily Press, we may note the optimistic remarks of the Parliamentary Secretary of the Overseas Trade Department (Mr. A. M. Samuel, M.P.), and of Mr. Godfrey Cheeseman, secretary and founder of the National Union of Manufacturers. The former asserts that there is a feeling of growing confidence in the minds of manufacturers, merchants, and traders, arising from a sense of security which results from a return to stable government. General trade conditions at home are better than they were a year ago, and he thinks that conditions in our export markets will be definitely better in 1925. Then Mr. Cheeseman gives it as his opinion that there is little doubt that the manufacturers and producers are very hopeful that 1925 will prove to be a vastly better year than 1924. Such views make cheerful reading, and, for ourselves, we think they are soundly based in the signs of the times. We gather there is already a promising livening up of business in the printing, bookbinding and allied trades, and there is no doubt at all that an improvement in the nation's industry and commerce generally must be accompanied by growing demands upon the printer, who is the indispensable collaborator of everybody who manufactures or sells. Let printers, by the use of their official Collective Advertising Scheme and of all other available means, make widely known to manufacturers and sellers the wonderful adaptability and power of the printed word, and they will thereby reap all the sooner the rewards of better business which the new year seems to hold in store.

Personal.

LORD BURNHAM will preside at a Newspaper Press Fund smoking concert in the London Press Club on January 17th.

MR. A. H. MUNDEY (Fry's Metal Foundry) is to lecture to-morrow at Sheffield University on "Die Casting," the lecture being arranged by the Institute of Metals.

MR. H. B. NAYLOR again delighted the members of the South-West London Master Printers' Association on Tuesday at Clapham Junction with a criticism of printing specimens which had been sent in for exhibition. In appreciation of Mr. Naylor's services to the Association, he was presented by the president (Mr. R. B. Simnett), on behalf of the executive and members, with an umbrella and an inscribed parchment.

AT the January meeting, on Tuesday, of the Printers' Managers and Overseers (Parent) Association, the president (Mr. R. H. Berry) was invested with the new presidential badge of the Association.

MR. ALEXANDER MITCHELL, who for more than a quarter of a century has been principal of the process department of the *Aberdeen Press and Journal*, has been presented by the staff with a wallet of Treasury notes on the occasion of his golden wedding.

ON completing 30 years as secretary of the Association, Mr. John R. Gibson has been presented with a gold watch and a well-filled wallet of Treasury notes by the members of Edinburgh Typographia, past and present.

MR. ARTHUR WATSON has been appointed managing editor of the *Daily Telegraph*, in succession to the late Mr. Frederick Miller. Mr. Watson, who has been with that newspaper for 20 years, is a member of a well-known family of journalists.

MR. GERALD BARRY has been appointed editor of the *Saturday Review*. For some years he has been a member of the editorial staff of the paper, and since last May he has been acting editor.

MR. R. E. BELL, who is concluding 13 years service on the editorial staff of the *North Mail and Newcastle Chronicle* and the associated publications to take up other journalistic work in the district, was, on Saturday night, presented with a handsome mahogany music cabinet from his colleagues.

MR. C. H. T. NEAL, formerly of the Holmesdale Press, Redhill, and successively on the staffs of the *Sheffield Telegraph*, the *Standard* and the *Daily Telegraph*, has been appointed assistant superintendent in the Government Printing Works at Lagos.

MR. HERBERT GREENHOUGH SMITH, for 34 years editor of the *Strand Magazine*, celebrated his 70th birthday on Friday.

MR. JOHN M. MURDOCH has resigned his appointment as editor of the *Ayrshire Post*, Ayr, after 31 years' connection with the newspaper, during 23 of which he acted as editor.

MR. MURDOCH is succeeded in the editorship by Mr. J. F. Macnair, of the *Glasgow Herald*.

ON the occasion of his departure from Torquay on relinquishing, through ill health, the post of editor of the *Torbay Herald*, Mr. C. E. Jillard was last week presented by his colleagues with a handsome smoker's cabinet.

THE presentation was made by Mr. W. O. Mills, editor of the *Western Evening Herald*, Plymouth, who expressed his regret and that of the proprietors that Mr. Jillard was forced to give up his job when the fruits of his efforts had begun to show.

A QUARTER CENTURY in the service of the Jagenberg-Werke Akt. Ges., Düsseldorf, Germany, has just been celebrated by Herr Bruno Ludwig, who at one time represented the firm in London.

Royal Society of Arts Competition.

Book Production and Allied Subjects.

In furtherance of the Royal Society of Arts plan to encourage the study of designs for industrial purposes by holding annual competitions, the second competition will take place in June, 1925. It will be open to two classes—(*a*) All British subjects and (*b*) students in British schools of art. Entries can be received only from individual designers, not from firms. The subjects of competition will be the same for both classes of candidates, but in considering the work the judges will bear in mind to which class the competitors belong. The six sections into which the competition will be divided include one devoted to book production and a miscellaneous section containing items relating to the graphic arts.

Designs for which prizes are not awarded may be "Highly Commended" or "Commended" at the discretion of the judges. The Society will confer its diploma on any candidate whose work shows exceptional artistic ability and practical knowledge of the materials and processes of his trade. After the awards have been made, a number of selected designs will be exhibited at the Victoria and Albert Museum, South Kensington, and subsequently at suitable centres in the provinces, where they will be brought to the notice of manufacturers likely to be specially interested in them.

Intending competitors must communicate between May 1st and 15th with the secretary of the Royal Society of Arts, who will supply them with the necessary forms, labels and instructions for the despatch of their designs to the Victoria and Albert Museum.

In the book production section the subjects of competition are as follows:—

1. Designs for either or both of the following: (*a*) a title page entirely set from type, with or without printers' ornaments; (*b*) a title page partly decorated. The title pages to be taken from any or all of the following: (*a*) "The History of Tom Jones, a Foundling," by Henry Fielding. (Size, demy quarto.) (*b*) "On the Morning of Christ's Nativity," by John Milton. (Size, crown quarto.) (*c*) A Scientific Paper. (Size, demy octavo) The copy in each case will be supplied by the Royal Society of Arts.

2. Designs for three pages of text, with chapter heading, from any or all of the books enumerated in Section 2 above, and in the sizes respectively indicated there. The copy for (*c*) will be supplied by the Royal Society of Arts.

3. Designs for *either* (*a*) a line illustration, or (*b*) a colour illustration. (The subject of the design must be taken from a well-known book, *e.g.*, one included in the *World's Classics* or *Everyman's Library*.) The design may be drawn to any size, but must be suitable for illustrating a crown quarto page (12½ ins. by 10 ins.).

4. An all over design suitable for general use as *either* (*a*) an end paper, or (*b*) a cover paper. N.B.—Paper jackets are not eligible.

5. Design for a binding for "The History of Tom Jones, Foundling," by Henry Fielding, in cloth (blocked).

6. Design for a binding for "The History of Tom Jones, Foundling," by Henry Fielding, in leather (tooled).

All designs must be submitted on paper, and not as finished articles. A prize of not less than £10 10s. is offered for each of the subjects set forth above.

In the miscellaneous section special prizes are offered by Messrs. Cadbury Bros., Ltd., J. S. Fry and Son, Ltd., Lever Bros., Ltd., Nestlé, A. and F. Pears and the proprietors of the *Graphic*. The items include designs for posters, wrappers and boxes, and a three-colour design for the cover of a Christmas number of the *Graphic*.

Printing in Ireland.

A certain slight improvement in orders can be recorded for the year in the local printing trade, but on the whole the twelve months just past have been one of the most uneventful periods the trade has had for some time—says the *Belfast News Letter*. Wages were standardised in 1923 up till December 31st of that year, and they still remain at the rates then fixed, no reduction having been made or increase asked. This quiet period has had the advantage of allowing trade matters to settle down, after the ups and downs of immediate post-war years. It is gratifying to record that there is comparatively little unemployment in the trade, and that friendly relations exist between employers and employees. An example of this was the successful bowling competition recently organised by the Joint Industrial Council of the Printing Trade, representing both employers and employees, and played in Belfast under the auspices of the Council's District Committee. Such competitions foster a good spirit, and Mr. John Boyd's action in presenting a trophy for annual competition is to be commended. The Belfast Printing Trade Employers' Association has offered prizes in the printing trade section of the Municipal College of Technology, and this is a further instance of that breadth of outlook which in years to come should lead to lasting benefit for the trade as a whole. No startling developments have been made during the year in printing machines, but there is, of course, always a certain amount of progress going on. The installation to any great extent of new machinery involves a heavy expenditure, but local printers are keeping their plant up-to-date in every respect; and, should the long-awaited trade boom come, they will be fully able to deal with the rush of orders it would bring, and execute them quickly, efficiently, and in the best style.

MR. E. A. BRISTOW (E. A. Bristow and Co) has taken into partnership as from January 1st Mr. W. W. Martin. The firm represents the two well known mills—the Societe Royale Hollandaise, Maastricht, Holland, famous for their thin opaque printings, India bible papers, thin banks, writings, imitation hand-mades, opalines, etc., and Otto Gunther, of Greiz, Germany, equally well famed for high-grade specialty covers, fancy box papers, manillas, etc. Mr. Martin has been associated with Mr. Bristow since the inception of the firm, and for many years prior to this, with the late concern of Dickenson and Hubbard, who also represented the mills in question. The style of the firm will continue as hitherto.

THE *British and Colonial Printer and Stationer* circulates all over the world.

Printers' Engineers' Achievement.

A feat which it is claimed has seldom been equalled in the printing industry has been accomplished by representatives of the Stockwell Engineering Co., who have dismantled an old seven-ton printing machine at the *Torbay Express* office, Torquay, and erected on the same site a 36 ton rotary machine, carrying out also considerable structural alterations and furnishing a big foundry equipped with the most modern apparatus—all in the two days of the Christmas recess. To build a rotary such as the one provided and carry through the trial runs usually occupies a month. The record-breaking work was personally superintended by the two principals of the firm named.

The rotary with which the newspaper is now equipped, at an expenditure of several thousands of pounds, will print, fold and count in quires at the rate of 25,000 copies an hour. During the past few weeks additional linotypes have been installed at the office and more are to follow, whilst arrangements are being made for a supply of the world's news *via* London by means of private telephone lines and a high-speed telegraphic instrument in direct communication.

The Bookbinder

Some Bindery Difficulties Discussed.

Lecture by Mr. B. J. SANSOM (London School of Printing).

All those who have personal experience of the everyday work of the bookbinder know that not only is he frequently faced with knotty problems in connection with the obtaining of satisfactory results in his own craftsmanship, but his difficulties are increased by many other troublesome points that arise from the lack of perfect adjustment in his relations to those engaged in allied crafts, particularly those who provide the paper and who print the sheets which the binder is required to turn into books. This subject being a very live one, it is not surprising that there was a good attendance of both men and women connected with the trade when, under the auspices of the Joint Industrial Council, Mr. B. J. Sansom (London School of Printing) lectured at Cambridge last month on "Some Difficulties met with in a Commercial Bindery." The chair was taken by Mr. Walter Lewis, University Printer, of the Cambridge University Press, and the whole of the proceedings evoked keen interest, questions and discussion following a very practical and useful lecture.

In introducing his subject, Mr. Sansom remarked that the various branches of the bookbinding industry covered so wide a field and provided so many difficulties, at times painful and perplexing, that but little thought was required to compile a collection of problems much more easy to enumerate than to solve. Indeed, so numerous were these difficulties that it would be quite impossible to deal with them all in one short address. The speaker turned first to the consideration of paper, remarking that for a number of years he had been impressing upon binders, rulers, makers-up, sewers, gilders and marblers the importance of having a knowledge of paper, for he had found that bindery workers seldom thought it necessary to have such knowledge, despite the fact that paper is the foundation of printing, ruling and binding, and many difficulties can be obviated by a knowledge of paper sizes, weights and surfaces.

Selection of Paper.

The first difficulty dealt with—one about which the binder often has no say—is the choice of unsuitable paper for a book. Nothing, said Mr. Sansom, was more unsightly in respect of a bound book than that the leaves, when the book was opened, should stand stiffly up instead of falling back and allowing the book to open flat. This fault would not occur were proper consideration given to the substance of the paper used. By the choice of paper too thick for a book of given dimensions the life of the volume was seriously curtailed, because the reader invariably forced the book open, thus either breaking the paper or breaking the back of the book.

The speaker also touched upon the different kinds of paper and their surfaces, particularly with respect to the use of size in their manufacture. In this connection the trouble, often experienced by rulers, of the "ticking" of lines (*i.e.*, colours running in to one another), was mentioned, and it was explained that this running was due to the absorbency of the paper, which again was due to the lack of sufficient sizing. The corrective was the addition of gum arabic to the ink. On the contrary the addition of ox-gall to the ink was recommended when, in ruling, it was found that the ink would not take properly on the surface of the paper owing to an excess of sizing. Hand-made paper created many difficulties for the ruler, owing to the fact that it was a heavily-sized paper, and the ruler resorted to the use of methyl alcohol in the colour, which combined with the grease and made possible a clean solid line. Also, in connection with paper, it was pointed out that sizing was of great importance to the gilder, as difficulty in gilding was often due to the use of antique or other printing papers containing little or no size. A remedy for such trouble was to apply to the book edge a coating of rosin size similar to what is used by the papermaker for writings, after which the gilding could be satisfactorily performed.

Selection of Boards.

Another important matter touched upon was the choice of boards for book covers. The speaker criticised the lack in many houses of a satisfactory system for the allocation of boards to a job. In stationery houses it was usual, he said, that one man be made responsible for the selection of boards, the binder not being allowed to choose for himself. That was certainly a hindrance to the development of all round craftsmanship. The selection of boards should properly be governed by weight, size and substance of paper; and, instead of the choice being made merely according to judgment or rule of thumb, there should be available tables or charts showing at a glance suitable thicknesses of boards of various kinds for paper of various weights and sizes. The use of a fixed scale enabled anyone to select suitable boards for books without any waste of time.

The Printer as Trouble-Maker.

In respect of troubles more directly blameable to the printer, Mr. Sansom said that many errors noticed after the sheets had been printed could have been obviated had a sheet, during make ready for printing, been folded into a section and submitted to the bindery overseer for inspection. Looking ahead to the passage of sheets through the bindery, he would be able to advise on various points in such a manner as to save time, trouble and disappointment in later stages of the work of book production. If, for instance, the margins should be out of truth, or if the bindery overseer saw that it would not be possible to get correct fall of the pages, he could point these things out so that the printer could modify his work accordingly.

Badly imposed formes were a source of much difficulty to the binder. It was common knowledge that, after sheets had been printed on one side, the printer sometimes took out a lead in order to make the pages back up properly. Practices of this kind should be discontinued, as they made a lot of trouble for the bindery, and it was often impossible for the binder to get proper alignment of pages in the finished volume. The printer should not take it for granted that paper as it came into the warehouse was square and of standard size, and he should do his utmost to avoid working off sheets shorter than standard. To the printer a slight diminution of margin might seem a trivial matter; but to the binder, working to fixed dimensions, and having perhaps to get the edges perfectly trimmed for gilding, a seeming trifle of this sort was often a vitally important matter.

Other subjects dealt with in the course of the lecture included the difference between stationery and letterpress binding, with a consideration of the respective thicknesses of sections and the methods of providing against "start," or irregularity in the disposition of sections after being sewn together. The subject of marbling also was dealt with in considerable fullness, and many difficulties encountered in this branch of work were helpfully considered. The questions and comments which followed the lecture showed that the practical nature of Mr. Sansom's remarks had been fully appreciated.

Notes and News.

Brighter Prospects.

The prospects for the bookbinding industry during the coming year are brighter by far than those which confronted it at the commencement of 1924. Dependent entirely as it is upon the general trend of trade and national prosperity, the bookbinding industry takes its outlook from conditions and prospects existing elsewhere. There is a spirit of optimism abroad in these other spheres and a sound confidence in the future of British trade. Unemployment figures are a progressively dwindling commodity in the key industries. British credit stands high, and the pound note is within close reach of the gold sovereign. Business is reported by the banks as showing signs of substantial improvement, and the banks themselves are preparing for an increased consumption of stationery. After a prolonged period of depression and acute unemployment the textile industries are once again getting into their stride. Taken all round, the situation promises well, and our bookbinding industry cannot fail to share the benefits that will follow in the wake of better trade in the more important sections of our industrial structure.

Book Buying Record.

It is claimed that the number of books issued during 1924 sets up a new record in the publishing world. So much the better for the bookbinding industry, for which so much extra work has been found. In the natural order of things the consumption of books should grow larger year by year. Granted normal prosperity that tendency would certainly operate. Unfortunately for us the dearth of spare cash has counteracted the desire to buy books for at least four years and, if we except the year 1920, it can be said that book-buying has never had a sound basis for ten years. The fact that 1924 figures exceed previous records is evidence that the condition of the country is working towards normal. Given an average year of employment and a tolerably good outlook there would be no difficulty in setting up book records far ahead of the 1924 standard, good as it is.

Red Inks for Ruling.

A difficulty which most account book rulers are meeting with is that of finding a suitable red ink for down lines. The brighter shades of colour are mainly, if not entirely, of coal tar or aniline origin, and they do not retain their colour on exposure. A glance back at

Digitized by Google

patterns stored away since the middle of the last century reveals red ruling which is as clear and bright and as full of colour as it was on the day it was ruled. Doubtless the colour of that period would be of vegetable origin, though cochineal, an animal dye, was also in favour. Principally we believe the red ruling inks were madder products and the cultivation of madder was a very extensive industry. The development of coal tar chemistry put an end to the madder industry, and introduced cheaper and brighter colours for quick and easy use in dyeing operations, but to the detriment of stability in colour. Madder inks are still to be had, though they are expensive in comparison with eosine, for instance, but it is an open question whether the use of permanent inks, even at the sacrifice of brightness of colour, is not to be preferred to the cheaper and more easily handled, but much more unreliable, modern dyes.

Leather Prices.

The bookbinding material market remains firm and stable, with leather prices on a slightly higher plane, as indicated last month. Skins are still scarce, and are subject to keen competition at the auctions. Basils and skivers are now being quoted about a penny per square foot in advance of earlier prices. Future prospects are uncertain, but according to manufacturers, there is no hope of a reduction until raw pelts become more abundant in the better qualities.

Miscellaneous Materials.

Glue averages round about £2 5s. per cwt. for fine grades for bookbinders' use, and there is a possibility of the price assuming an upward tendency. Bookcloths, buckrams, calicoes, threads and tapes remain unaltered, and, excepting calicoes, it will be observed that there has been a steady price level for over a year.

Examinations for Master Bookbinders

There is a new and interesting development in the Swiss bookbinding industry which is a proof of the importance attached in Switzerland to professional and technical qualifications even in the case of the employer. This year, for the first time, says *Papyrus*, the Zurich School of Arts and Crafts organised examinations in bookbinding at which there were eight master bookbinder candidates. A course of lectures given previously was well attended by members of the Zurich branch of the Swiss Society of Master Bookbinders. The lectures included one on the subject of prices and one on accountancy. All the eight candidates were successful in the examinations. A master bookbinder's diploma of honour was awarded to five of the most successful candidates.

THE *Daily Herald*, in its determination to forge further ahead in the New Year, is providing improved accommodation for its composing and other departments, whilst a new rotary machine has been ordered from Messrs. Foster and Sons, of Preston, to provide an extra output of 18,000 copies per hour.

LATEST statistics indicate that the number of factories engaged in book, paper, printing and engraving operations in Australia during 1922-23 amounted to 1,347, whilst the number of employees was 31,015. The aggregate wages paid in these industries reached a value of £5,887,000, and the value of the fuel used during the twelve months stood at £226,000. The weekly wages of compositors in Sydney during 1923 stood at 102s. for a 44-hours week. Those in Melbourne were 106s. (48 hours); Brisbane, 101s. (44 hours); Adelaide, 102s. (48 hours); Perth, 101s. 6d. (44 hours), and Hobart, 100s. (48 hours).

Klipto Loose-Leaf Products.

Mr. G. A. Bennett, president and general manager of the Klipto Loose Leaf Manufacturing Co., of San Francisco, U.S.A., is now on a visit to this country. Mr. Bennett, an Englishman, is the inventor of the Klipto loose-leaf products, and is to be congratulated on the great success achieved, not only in the United States but in Australia and New Zealand.

The Klipto products have an established reputation in the United States where their outstanding features have found a speedy recognition, and to-day they are in universal demand in all the principal States throughout the country.

The works of the Klipto Loose-Leaf Co., Mason City, Iowa, may be referred to as a model establishment containing the most modern and up-to-date machinery. The Klipto products manufactured are recognised for their utility and simplicity, and are appreciated by a large body of users for their time and labour saving value.

Mr. Bennett went to Australia some 10 years ago, when he introduced his invention there, and he has had the satisfaction of seeing an important business developed in association with the manufacturing firm of Messrs. Redmond, Inglis and Co., of Melbourne. Steady expansion has also been experienced in New Zealand, where license to manufacture was granted to Messrs. Leighton Bros., of Auckland.

During the last three years Mr. Bennett's business interests have been centred in the United States. He established the Klipto Loose-Leaf Manufacturing Co., at San Francisco, and of this parent company he is president and general manager. A later development was the establishment of the Klipto Loose-Leaf Co., successors to Lemars Printing Co., at Mason City, Iowa, as previously mentioned.

Mr. Bennett, we understand, is open to enter into negotiations for the disposal of his manufacturing rights for Great Britain, Canada and France for the Klipto products. Among the range of articles manufactured it may be mentioned that the Klipto binders are made in sizes varying from tiny note books to large volumes 28 in. by 26 in., and are designed to fit all standard punch sheets. The main characteristics are security, simplicity, speed and lightness.

Binding Cloth, etc., for Egypt.

The Commercial Secretary at Cairo has forwarded particulars of a call for tenders by the Egyptian Government press, Ministry of Finance for the supply of binding and printing material for the financial year 1925-6. The materials required include cloth for binding, string, tape, printing and duplicating ink, type-metal, etc.

Tenders, which should be accompanied by samples, will be received up to noon on January 23rd, 1925. Copy of specification, conditions of tender, etc., are available for inspection by interested British firms on application to the Department of Overseas Trade (Room 20), 35, Old Queen-street, London, S.W.1, while a few copies are available for loan, in order of application, to firms unable to arrange for inspection in London.

Tenderers must be represented in Egypt. The Department will be pleased to place British firms desiring to tender, but not so represented, in touch with British merchants who are prepared to handle tenders, through their Egyptian branches, on behalf of third parties.

Bindery Service.

Most binders have very little difficulty in the appraisal of their own services. There is a disposition to place a value on them that is not fair to themselves. Six factors enter into this complex question of appraising service, and the individual is often swayed by his emotions in making his decisions. On the one hand you will find fear, doubt and modesty, and on the other hand avarice, desire and egotism, and the result is that he has either over-estimated or under-estimated the value of his services. In either case the ultimate results are the same. Unfair and unjust estimates either way are detrimental and lead to the demoralisation of the industry.

This is outstandingly true where the binder does not have a definite plan or system to determine what his operating costs are.

Granted, that the average man is not capable of weighing understandingly the features that enter into the computation of value for services rendered, in what manner can a fair and just value of services rendered be determined? The only way is by the aid of a trade association. There you have all sorts and conditions of men, some hard-headed, others with an abundance of emotions. Every individual is necessarily affected by the acts of some or all of those connected with the bookbinding industry. His selling prices are daily set by the acts of his competitors. Whether they are reasonable or unreasonable he often cannot determine because of the limitations of his own environment.

Doctors, lawyers and other professional men submit bills for services rendered. It is the thought, knowledge and intelligent effort expended on behalf of their clients and patients that go to make up their charge. Every binder should charge for the knowledge and effort expended in his production. How many of the binders ever think of the vast expenditure of mental effort that is necessary before the mechanical department can begin to produce? The solving of this problem would add materially to their profits and have a decided and far-reaching effect upon the industry as a whole.—O. W. BRUEHMANN (Chairman, Pamphlet Binders Group of the Employing Bookbinders of America).

BREHMER

Folding Machines.

BREHMER

ROTARY AUTOMATIC FOLDING MACHINES

Brehmer Folding Machines fitted with the Rotary Feeder, are capable of delivering up to 3,750 sheets per hour.

PRINCIPAL ADVANTAGES.

1. The feeder can be refilled whilst in operation.
2. These machines do not require any more space than those required for hand feeding.
3. They are accessible from all sides
4. There is no smearing of freshly printed sheets.
5. Power required about 1/3 H.P.

IF YOU ARE INTERESTED SEND FOR FURTHER PARTICULARS AND SAMPLES.

AUG. BREHMER'S (BRITISH) SUCCESSOR.

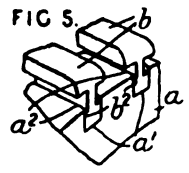
New Inventions



Imitation Leather.

An imitation leather product from cellulosic material is made by impregnating a thick, very loosely felted sheet of cellulosic material, e.g., a layer of carded cotton, with a very thick and viscous adhesive, preferably a 20 per cent. solution of rubber in naphtha or gasoline, compressing, evaporating the solvent, passing through a calender while under tension to remove any wrinkles, and finally applying a leather dressing. The impregnating solution is added practically at the nip of the compressing rolls, so that it is worked into the fibrous mass as the latter passes between the rolls. If desired a second impregnating treatment can be given before evaporating the solvent.

Type Holders.

Type holders for loose types as patented by Mr. C. O. Ericsson, consists in an improved method and means for securing type holding bars to printing drums, cylinders, flat magazines and other supports. The cylinder or other support *a* is provided with grooves a^1 to accommodate the bars *b* provided with shoulders b^2 on to which the metal a^2 at one edge of the groove is burred or turned over at

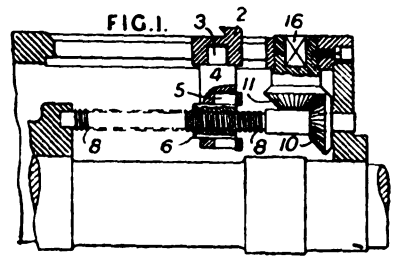
FIG 5.

intervals along the bars to secure the bars to the support. To prevent endwise movement of the bars a groove 15 is formed in the end of the support *a*, such groove also passing through the ends of the bars *b*, and a wire or other element is placed in the groove and secured therein by burring over the metal at the edge of the groove. A plate may be secured to one end of the support *a* to prevent removal of the types at that end.

Stereotype Plate Clamps.

Mr. R. W. Hatton has patented an invention by which stereotype plates are clamped between a fixed ring or dog on the cylinder and a number of clips 2 mounted on studs 3 integral with a spider 4 movable towards the fixed ring or dog and so mounted as to be capable of rocking to allow the clips to engage evenly with the plate notwithstanding unevenness in the edges of the plate. In one

FIG.1.



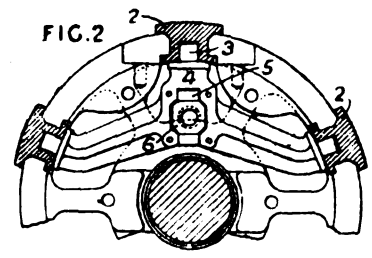


FIG.2

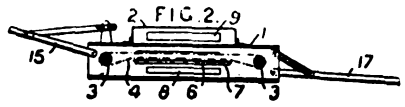


form, Figs. 1 and 2, the spider 4 is mounted on trunnions 5 on a nut 6 operated by a screw 8 which is rotatable by gearing 10, 11 and a key inserted in a square recess 16 in the gear 11. In another form, the nut 6 is spherical and engages a corresponding recess in the spider so that the latter may rock in any direction.

Relief Printing.

An invention by Messrs. G. Schauly and L. Gernigon, relates to the production of relief

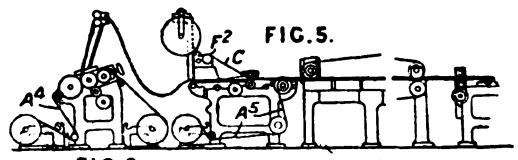
FIG.2.

printing by spraying a fusible powder over a printed sheet and passing the sheet through an oven to fuse the powder and cause it to amalgamate with the ink and provides an improved form of oven for this purpose. The oven is in two parts 1, 2 within which are mounted opposed heating devices 8, 9, a heat-distributing plate 6 with downwardly directed ribs 7 being arranged over the device 8. Sheets from a feed table 15 are carried through the oven by means of an asbestos or metal endless band 4 and are delivered to a table 17. The band 4 passes over rollers 3 driven by an endless chain operated by hand or power. An additional distributing plate may be arranged above the plate 6 and between the upper and lower reaches of the chain.

Corrugated Fibre Boards.

In reinforcing corrugated fibre board used for making folded boxes, Messrs. Thompson and Norris, in a recent patent, suggest that separate reinforcing strips or tapes of paper, cloth, or the like be applied to the board during manufacture and before the board is cut, slotted, scored or otherwise treated. In the apparatus shown, the card-

FIG.5.



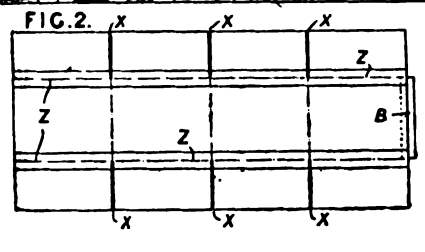


FIG.2.

board is corrugated and provided with a backing A^4. Reinforcing strips C are gummed at F^2 and applied to the backing A^4, and a facing A^5 applied. The sheet so produced is then slotted at X, Fig. 2, scored at Z, and the blanks cut off and provided with an adhesive strip B. The reinforcing strips are used on the inside of the box.

Zinc and Copper Process Plates

Used by all the Leading Newspaper and Process Houses in the British Empire. Supplied in all Gauges and Sizes. Also High Grade Zinc and Copper Plates for Etching, Engraving, Mezzotint, Aquatint, and Artists' Requirements.

Papermakers' Organiser.

Amalgamated Society's Appointment.

Mr. J. Goddard, of 14, Stanbrook-road Gravesend, has been appointed Southern Organiser to the Amalgamated Society of Papermakers.

Mr. Goddard, who is 40 years of age, commenced work as a boy at Snodland Paper Mill, and remained there until 1912, when he

Photo, W. T. Munns, Gravesend.

MR. J. GODDARD.

obtained employment at the Imperial Paper Mill, Gravesend, with whom, except for a break for service with the Colours, he has remained until the present time.

During his association with the Society Mr. Goddard has always taken a prominent part in endeavouring to improve the conditions of of his fellow workers and has been one of the Society's most active workers. For the past two years Mr. Goddard has been a member of the Executive Committee, and in view of the earnestness with which he entered into the work, he soon obtained the confidence of that body, with the result that he was appointed a member of the Negotiating Committee and the Joint Industrial Council of the Paper-making Industry.

Mr. Goddard is held in high esteem by all with whom he has come into contact, either at work or in the many and varied spheres of his activities, and his appointment, needless to say, is a very popular one in the South of England, where he is very well known amongst papermakers.

Mr. Goddard's employment at Imperial Mills has now terminated, and he carries with him the very best wishes of the Executive and officers of the Society in taking up the duties of organiser.

A mass meeting was held at St. Marks Hall, Rosherville, Gravesend, on Sunday, December 21st, to inaugurate Mr. Goddard's appointment as organiser.

Trade with Uruguay.

The Overseas Trade Department have issued an interesting report on the financial and economic conditions in Uruguay which has been prepared by Mr. H. W. Reid Brown, British Vice Consul at Montevideo. Dated September, 1924, the booklet, which is published at 9½d. post free by H.M. Stationery Office, reviews the conditions of the country under the separate headings of finance, trade, industry and production, transport and communications, and legislation and administration. A series of appendices furnish statistics of imports and exports. During 1923 sheet paper was imported to the extent of 2,643,424 kilos., of the value of $370,079. These figures compare with 1,955,969 kilos. and $273,835 in 1922. Imports of news print in 1923 were 4,562,286 kilos., of the value of $273,735, the figures in the preceding year being 3,597,463 kilos., $215,846.

X Of Interest to Envelope Manufacturers.

AT present there is an unprecedented demand for labour-saving machinery. The latest Adjustable High Speed **"Leader" Envelope Folding and Gumming Machine** has been specially designed to operate at a higher speed than any other machine of similar construction. The output is enormous, viz., 185 perfectly folded and gummed envelopes per minute, and the gumming is applied by a wipe-off gummer and not merely dabbed on. This new Machine is almost noiseless even when running at its highest speed. It is built to take any size of commercial or court envelopes within the following range—$6\frac{1}{2}$ x $3\frac{7}{8}$" down to $4\frac{1}{8}$ x 3", and any number of sizes and shapes between these limits can be produced on the same machine.

Be prepared for keen competition by installing High Speed Leaders in your plant.

The Trend of Photo-Engraving and Photo-Offset Printing.

By WILLIAM GAMBLE, F.R.P.S., F.O.S.

A little more than two years ago in this hall I gave a lecture on "The Influence of Photo-Offset and Rotary Photogravure on the Future of Letterpress Printing." In that lecture I indicated the effect which composing without type, by the aid of photographic processes, would have on letterpress printing. I tried to show that the tendency would be to drive printing towards offset and photogravure.

My remarks were received with some scepticism on the one hand and with some degree of alarm on the other. I fully expect to be reminded that nothing has really happened to cause alarm. You may point out that letterpress printing and block-making seem to be still going along with apparent prosperity, that typefounders appear to be doing pretty well, that mechanical typesetting machines seem to be as largely and increasingly used as ever, and that printing machine builders are evidently quite optimistic as to the future prospects of business. Thus I am afraid you will regard me as a prophet whose predictions are not very trustworthy. Did I not say, you may ask, that photo-composing was bound to come, and that it might take only five years to develop into something useful? Here are more than two years gone, and how far have we got?

I am quite prepared to believe that such thoughts are in your minds, and I want to say at the outset that though the photo-composing idea has not yet been fully realised, a good deal has been done towards it in these two years. You have had described to you by other lecturers in this hall machines which are already in existence carrying out the idea of photo-composing, and which show great promise. If these machines are not yet perfected and available for the use of the trade, it is not the fault of the inventors, but simply due to lack of means or want of enterprise on the part of manufacturing firms who ought to be in the forefront in developing an idea which will undoubtedly be realised in time, and which when consummated will have a very great influence on the printing industry.

In spite of this lack of encouragement, I know there are a number of inventors at work in various countries on this problem, and if only as much work as has been done in the past two years is applied in the next three, we may expect to see something like a practical solution within the five years I gave for its accomplishment. So radical a change as this must necessarily be a matter of slow and progressive development from one improvement to another, just as was the case in mechanical typesetting. I am convinced that text composing without type will come in some form or other. The need for it is becoming more and more insistent as offset and photogravure develop. No one can dispute that these processes have made great strides in recent years, and they are destined to go a good deal further.

In my present lecture I want to indicate what is the trend of photo-engraving and photo-offset printing, ignoring for the moment rotary photogravure, because that would widen the subject beyond the limits allowable for this lecture, and because I understand that another lecturer will shortly deal with this subject.

The Influence of Offset on Block-making.

First, I want to deal with the influence of offset on block-making. Is offset printing, with the aid of photo-process methods, seriously affecting the output of the photo-engravers? I do not think it is. There are photo-engravers who have opened departments for offset plate-making, but have not found that the block-making side of their business has suffered. Whatever work offset printers are doing by the aid of photo processes seems to be for the most part additional to the demand for blocks, which is probably as great as ever, though I do not think it is an increasing demand.

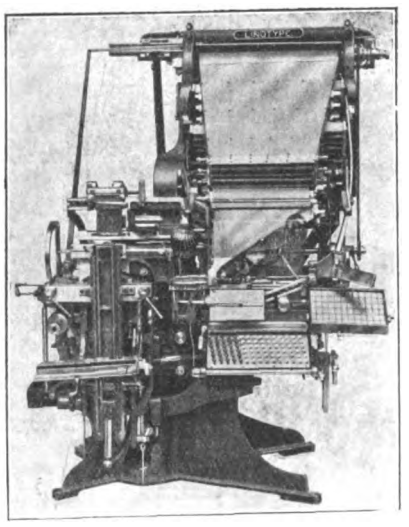
There may be a few instances where a book is reprinted by photo-offset, and if there are illustrations in it the block-maker loses to that extent; but probably the book never would have been reprinted but for the cheaper processes employed for its production. The block-maker could never hope to compete with the Manul, the Wincor, the Novographic and similar processes, in laying down the reprint of a book. He could never hope with camera-methods to compete with processes which can be done without the camera and with comparatively unskilled labour. There is a good deal of this reprint work being done, which is so much extra work for the lithographic printer, but is entirely outside the province of the photo-engraver. If it is affecting anyone it is the book printer, for he cannot hope to compete when books can be reprinted at a cost, including the paper, which is less than the expense of the type-setting, even when mechanical composition is employed.

There are also cases where catalogues containing half-tones have been done by offset because the customer has preferred the method, either as a novelty or because he liked the effect better, but I have not heard it claimed that such catalogues have been produced more cheaply than by blocks and letterpress printing.

It does not by any means follow that in every case photo-litho plates will be produced more cheaply than blocks. It is quite possible to take some job done by photo-offset and find that the cost of laying down plates with mixed line and half-tone illustrations and text will come out higher than if done by block and letterpress, taking each kind of work at standard rates. In one case I investigated, the blocks would have cost £16, and the litho plates came out at £25. The cost of ink and machining would be no less in litho, though there might be some saving in make-ready, and a cheaper paper could be used.

Probably the reason why offset printing is not making greater inroads in the block-makers' business is that offset plate-making is not yet quite such a sure thing as photo-engraving. There are many pitfalls and difficulties, and often jobs come out far from satisfactorily. Those who are engaged in this work are groping slowly and painfully, with much unproductive expense, to discover the most reliable methods for obtaining successful results every time.

You must bear in mind that photo-litho is still in its infancy, whilst photo-engraving is nearing its prime. When the younger process has had as many years of life, we may look for far greater accomplishments, and we may even find that it has outdistanced anything that has been done up to now in block-making, especially in half-tone and colour work.



Limitations of Offset for Half-tone Reproduction.

No one can say that the offset half-tone work shown up to now has equalled the clean and effective quality of letterpress half-tone. In the best of offset half-tones there always seems to be something wanting; they are mostly flat, grey and lacking in detail. The reason is that the half-tone process has limitations which are very obvious when it comes to be applied to offset printing. The photo operators no doubt get just as perfect negatives as those for block-

THE NEW MODEL 4 THREE-MAGAZINE LINOTYPE IS EQUIPPED WITH ALL THE LATEST IMPROVEMENTS

—including:

IMPROVED MAGAZINE-CHANGING MECHANISM, whereby not only may the magazines on the machine be changed more easily than ever, but any of the three magazines can be replaced by others without removing those still required on ths machine.

IMPROVED ASSEMBLER DRIVE, through shaft and helical gear instead of belt.

IMPROVED CASTING MECHANISM, with Double Pump Spring Attachment, the extra pressure being available at the will of the Operator.

AN EXTRA SAFETY DEVICE, whereby it is impossible for the Operator to start up the machine until the line is transferred from the first to the second elevator.

A FULLY AUTOMATIC DEVICE for casting blank lines.

ASSEMBLER ELECTRIC LIGHT FITTING, arranged to give the Operator a perfect light on both assembler and copy, and at the same time to protect his eyes from the glare of the lamp.

This improved model is so constructed that the *Large Display Section* can be added in the customer's own office at any time.

making, and the printing-down on to the metal is just as sharp; but when the plates are put on the machine the prints appear flat, grey and woolly. Why is that so? I believe it is due to a conflict between the two processes, which do not seem to agree well with each other. The half-tone theory demands that the dots should be absolutely black and sharply defined against the whitest possible paper to get the most perfect result. But the offset printer asks for a coarsely-grained plate to suit machine printing conditions. This results in the dots being partly out of contact when printed down from the negative, and as a result they print ragged, some dots being missed altogether. Again, the offset printer firmly believes that he can improve a half-tone print by washing-out and inking-up again. He also believes in the efficiency of various "dopes" and "etches" as an aid to getting clean prints, yet this treatment is usually fatal to the work of the process man. Printing on matt-surfaced papers is also against getting crisp half-tones.

Until a process can be found in which the image on the offset plate is as durable and as clean edged as the fish-glue enamel image on copper blocks, there is no hope of offset half-tone being much better than it is.

Dry Lithography.

When "dry litho" is really achieved, good half-tone offset printing should become easy. There is a process now being successfully worked in America called "Aquatone," which seems to approach the ideal requirements. The plate is prepared in much the same way as in collotype, but on zinc instead of glass, and the gelatine used for forming the image is not dissolved away from between the dots or lines; on the contrary it is hardened so that it forms a film which is receptive of water but repellent of ink, and it also prevents oxidation. It is said that a quantity of ink can be deposited on the image which would be impossible with other processes, thus permitting a greater speed in printing than in ordinary litho work. It is claimed that 3,600 per hour is regularly attained. Half-tones as fine as 400 lines per inch can be printed, or grained images as fine as 1,200 to the inch. This is evidently the kind of process offset printers want.

The photo-engraver discovered twenty-five years ago that half-tone images developed with transfer ink did not yield the sharpness required for the best results, yet offset printers go on using this method, and fail to see that it is one of the principal reasons why their work is not as clean as the blocks.

There are several inventors at work on the idea of making half-tone offset plates of better quality and easier to print. Mr. Ronald Trist claims that he has done a great deal in this direction, but is not yet prepared to publish particulars of his methods.

In my opinion "dry litho" accomplished by modification of the ink will not be sufficient until plates can be made that will not fill up and thicken in the course of printing. Years ago the Wharf Litho process, invented by Mr. G. R. Hildyard, was introduced, and, to my mind, this process came very near to the realisation of what is now required; but the process was exploited at a time which was too early for it to be pro-

perly appreciated. It could now be revived, and in the light of our present knowledge might prove very useful. I recently got Mr. Hildvard to make me some plates by his process, and they printed very well on a letterpress machine. Wharf Litho was in one sense of the word a "dry litho" process, but it did not require any special ink, nor anything but ordinary composition rollers. The plate was slightly etched into relief, and there was a peculiar grain in between the work which gave an ink-repelling quality to the plate without any damping.

Printing Litho Plates on Letterpress Machines.

The feature of Wharf Litho that made it most interesting was that you could print litho work on letterpress machines, and I want to emphasise the importance of these "dry litho" methods for letterpress printers. Do you realise that if litho plates can be made so that they have an unchangeable print on them, and so that they do not require damping, you may be able to print them just as well on letterpress as on purely litho machines? With improved methods of laying down the work quickly and cheaply on such plates, it will be unnecessary to put type formes on the machines, and there will be no making-ready to do. Then you can snap your fingers at the litho offset printer, and, come what may in photo-composing machines, you will at least not have to scrap your printing machines. So there is a ray of hope, a rift of blue sky, for the letterpress printer after all.

Possibilities of Grain Processes.

As I do not think it will ever be possible to get offset printed half-tones to look as crisp and clean as letterpress from blocks, offset printers might do better to turn their attention to perfecting processes of making grained images on the litho plates instead of using the half-tone screen. In this way the print would correspond more closely to the character of the grain on the plate. Retouching could then be done with the lithographic crayon without such work appearing too evident. The irregular grain would suit the matt surface of the paper, and any slight spreading or filling up would not show so badly as it does with half-tone.

It may be that some of you have tried grained screens, and have been disappointed with the result. Probably the reason is that you have not carried your trials far enough. The proper use of grained screens has to be learnt by long experience, and when as much thought and time has been given to the subject as to ruled screens they will be better appreciated and more extensively used. Further, I must remind you that there are various kinds of grained screens, and it has yet to be discovered which is the most suitable. There is the Metzograph screen, which I consider the best of all; but unfortunately the inventor and maker is dead, and the manufacture has not been continued. There are a few of these screens still available, and no doubt many process shops have one or more put on one side and never used. These might well be brought out and tried again.

Besides the grained work produced with screens there are numerous processes for forming a grain on the plate, and these are capable of yielding very good results. Some of you will recall to mind the Pretsch, the Dallas, the Frey, and other methods which have been put forward and are now almost forgotten. Probably, some day, one or other of these old processes will be dressed up in modern clothing and exploited as a new process, to be hailed as the very latest idea. Some firms will no doubt foolishly pay a big fee for the secret, when they might just as well dig up the process themselves in the back numbers of trade journals or in old lithographic books—or they might well draw on the memory of some old worker.

Grained work does not seem to be suitable for block-making, as it is so difficult to retain the finer grain points in etching, and the effect is, therefore, coarse; but for lithography grained work is ideal. I wonder it is not more used, and I would certainly recommend you to look up and study these old grain processes.

Necessity of High-light Effects in Lithography.

Whether you use grained screens or ruled screens there is an absolute necessity in lithographic work for what are termed high-light effects. What is meant by high-light is this: The block-maker must get clearly-defined dots all over his image, his rendering of the tone values being by means of larger or smaller dots. In the whites or high-lights he aims to have very fine dots on the plate, as he must support the ink-rollers and the paper in printing; but the lithographer is not tied down to any such necessity, and can therefore have high-lights without representing them by fine dots. If he follows the block-makers' methods he will get a flat result, for the dots are bound to spread somewhat, or some of the finer dots may disappear altogether, giving a crumbly effect. Moreover, the lithographer cannot do anything on the plate equivalent to fine etching as done on blocks. The lithographic negative maker must accordingly make a more contrasty negative, and the best kind is that known as the "high-light." In this case the dots in the high-lights of the negative are closed up until no dots are printed through on to the zinc, and the shadows must print strongly. Between these two extremes there must be perfect gradation of tones. Such an effect is not easy to obtain. In closing up the high-lights of the negative there is a danger of lowering the values of the middle tones, and making the shadows print too grey. Some operators are more successful than others in effecting the necessary compromise, but I do not think anyone can claim to be able to make the perfect high-light negative for lithographic printing every time, especially as the conditions vary with every original.

The late Mr. Frederick Sears was a master in securing high-light effects, and, though his methods are known, there are few who can equal his work. The drawback of his method was that three plates had to be made for every print or every colour, so that on a five-colour job there would be fifteen plates to make—with fifteen chances of going wrong, either in register or in tone values. To-day high-light effects are got by suitable choice of diaphragms and by screen distancing.

With the grained plate methods, such as that of Frey, the high-light effect is got naturally, because a continuous-tone negative is used—that is to say, there is no screen in the negative.

Processes have been proposed for getting high-light effects by removing the screen during part of the exposure, or by having some clockwork or electric-motor-driven mechanism to open the diaphragm gradually. Dr. Albert, of Munich, introduced over here, years ago, a method of superimposing a positive over the negative, and printing through the two together, the positive serving as a mask to cut out the parts not wanted in each plate. A special printing frame and special arc lamp had to be used, and the process was found too troublesome to be practical.

The Bassani process, which is now being demonstrated in Paris, consists in having a mechanical device in the camera to move the screen in a small circular path. This has the effect of spreading the light action which forms the dots and brings about the closing up of the high-lights. One cannot help thinking that this spreading must equally affect the middle tones and shadows.

No doubt in time some standardised method, suitable for lithographic work—perhaps through a modification of the screen—may be worked out. Every-day practice is the best teacher in these matters.

Insufficiency of Tri-colour for Lithography.

The difficulties met with in making negatives by the half-tone method for black-and-white lithography are increased tremendously when colour separations have also to be made. Not only has the operator the greater difficulty of securing clean printing negatives on dry plates than on wet plates, but he has to keep in mind the necessity of getting proper colour selection and good register. It does not seem possible to get effective litho work in only three colours produced directly from the original, and most firms resort to five or six printings. The reason is, mainly, that it is not possible to obtain perfect colour separations in the negatives, and there is no adequate means of making corrections as there is in the case of fine etching. Even when the best photographic result is obtained there is too much risk of the colour values altering in the machine printing. With two or three extra colours to work with, the defects

Mr. Gamble at Stationers' Hall.

Another Notable Lecture.

Another technical lecture of the very first importance has to be recorded to the credit of the London Central Districts Master Printers' Association. At their meeting at Stationers' Hall on Wednesday evening of last week, Mr. William Gamble, F.R.P.S., F.O.S., delivered a lecture (which we print in full in this issue) on "The Trend of Photo-Engraving and Photo-Offset Printing." It will be remembered that, under the auspices of the same association, Mr. Gamble lectured just over two years ago on "The Influence of Photo-Offset and Rotary Photogravure on the Future of Letterpress Printing" and that lecture, reported fully in our issue of November 9th, 1922, was reprinted in the trade journals of America and elsewhere and raised universal attention and discussion. We think that no less interest will attach to this, Mr. Gamble's latest utterance in respect of the remarkable technical developments of the present time.

The interest of the occasion was enhanced by an extensive and most interesting exhibition in the large hall, comprising specimens of process work of various kinds, chiefly offset. Items that attracted special interest were some remarkable specimens showing the photographic reproduction of letterpress matter as done by the "Novographic" process of Messrs. Lowe and Brydone (Printers), Ltd., Wharf-litho specimens in colour by Mr. G. R. Hildyard, some examples of the Frey process, the Huebner-Bleistein process, a colour picture produced on the basis of Mr. Bawtree's theory of colour (as included in Penrose's Annual) with the original beside it for comparison, also specimens of the wonderfully fine work in illustration and text produced by the Aquatone process. Those lending specimens for the exhibtion included: The Government of India, Messrs. Charles and Read, Ltd., the Clifton Studio, Messrs. David Allen and Sons, Ltd., Johnson, Riddle and Co., Ltd., Fuller's Studios, Messrs. Vincent, Brooks, Day and Son, Ltd., Messrs. Blades, East and Blades, Ltd., Mr. Paul Fischer, Messrs. John Swain and Son, Ltd., Messrs. Suttley and Silverlock and the Engravers' Guild.

The lecture attracted an exceptionally good attendance, the spacious Court Room being well filled. The chair was taken by the president of the Association, Mr. Geo. Eaton Hart, who was supported by the hon. secretary, Mr. W. J. Boyle, and there were present many representatives of leading London firms connected with the lithographic and other branches of illustrative printing.

In opening the proceedings, Mr. Hart remarked that Mr. Gamble was a man of world-wide reputation, and there were very few men who had done so much as he for the printing craft on its photographic side. The chairman went on to refer to the present-day importance of offset, and its invasion of the field of the letterpress printer. Offset, he said, had already created a revolution in the craft, and letterpress printers found themselves puzzled to know where they stood in face of this remarkable development.

Mr. Gamble then delivered his lecture, which was listened to with close attention throughout, and elicited very hearty applause.

The chairman then threw the meeting open to questions and discussion, emphasising in his remarks the success of offset printing in producing typographic matter, and guardedly expressing the opinion that it was now conceivable that even newspapers might some day be produced by offset. With regard to web rotary offset printing, he asked whether the figure of 6,000 an hour cited by the lecturer referred to one side or two sides.

Mr. Colebrook made references to photogravure, offset and photo-composing, suggesting that there were inherent features in all these methods which would continue to hamper them in the matter of speed as compared with letterpress methods.

Mr. Gamble, replying first to Mr. Hart's question, said that the speed of 6,000 he had mentioned was a unit speed. He had first timed the web rotary offset machine at the Elm Press at a speed of 6,000; this was then increased to 8,000, and the machine still printed very well; then the speed was put up to 10,200, and at that it was giving just a little slur as though the practicable limit had been reached—although it was said that certain necessary adjustments would obviate the difficulty. The 15,000 he had mentioned in the lecture was also a unit speed, but doubtless the tendency in practice would be to put duplicates on the cylinder, and so get larger output at comparatively low unit speed.

In regard to Mr. Colebrook's remarks, Mr. Gamble disagreed with the suggestion of a speed handicap on photogravure and offset, and said, in respect of photo-composing, that they should consider the speed of the cinematograph — normally sixteen pictures per second— and remember that some of the photo-composing machines now being devised are based on cinematographic principles.

In respect of queries raised by Mr. T. Tonkin and the chairman—as to the actual daily output of the web offset machine, allowing for stoppages—Mr. F. J. Connolly said that the design of the machine was so excellent that only about 25 per cent. need be deducted from actual running speeds in order to get the output for the day's run.

Mr. H. M. Heywood said that the two-colour litho offset, large size, would produce 20 reams a day; whilst a double demy one colour produced 25 reams - though the output would not be quite so great with high class work in which register required special care.

Mr. J. Geddes, in the course of a few remarks, said that letterpress printers should realise more fully the need for further development of letterpress printing, with respect to the elimination of make-ready, etc. Photogravure had its own field, offset had its own field, and letterpress had its own field. It was up to each method to develop its possibilities to the full.

After a few others had joined in the discussion, Mr. R. B. Fishenden very cordially proposed a vote of thanks to Mr. Gamble, in whom, he said, they had a wonderful liaison officer between the photo-engraving and the printing sides of the industry. No other country had a man so well qualified to perform this function. In the course of further remarks, Mr. Fishenden emphasised the value of salesmanship in promoting the use of one process rather than another. He also suggested that it was now being found that, by more careful operation of machines, it was possible to do without the coarse grain formerly thought necessary on plates, and to work with finer grain. Other points in his interesting speech were the advantage given by the regularity of the half tone screen in contrast to grain effects, the excellence but difficulty of the Albert process, and the hope of better colour work on the basis of Mr. Bawtree's colour theory. He concluded by assuring letterpress printers that there was no process that could compete with letterpress for the best class of typographic work produced by high grade letterpress impression.

Mr. A. E. Goodwin ably seconded. After touching lightly on the possibility of labour demarcation troubles in connection with the extension of lithographic printing to letterpress machinery he referred appreciatively to the specimens exhibited that evening, and recalled the suggestion recently made that a permanent exhibition of printing specimens was required in London. Visitors, he said, were constantly asking where they could see specimens of British printing, and there was a real need for a permanent exhibition. Mr. Goodwin also drew attention to the presence at the meeting of Colonel Willis, who is in charge of the Government of India Printing Department, and he welcomed him on behalf of those present.

In a brief response, which brought the meeting to a close, Mr. Gamble suggested that the tendency of the future would be to conduct the printing industry with more regard for science and for mechanical inventions and less dependence upon human skill.

Poisoning Amongst Lithographers.

The attention of the Health Committee of the Joint Industrial Council having been called to the fact that some workers engaged in the lithographic section of the industry suffered from bichromate poisoning through using bichromate of potassium in etching plates, the Committee are indebted to Mr. J. R. Gardner (Stockton-on-Tees) for the following formula of a substitute which he has used with satisfactory results for several years as a zinc plate etch. It is of no service for developing photo-litho transfers:—

2 oz. Phosphate of Soda
2 oz. Sodium Nitrate
1 oz. Sulphuric Acid
} to 1 gallon of gum and water — allow to remain on 3 minutes.

Note.—Gum and water solution may be from 10 to 20 per cent. strength, sufficient to enable the etch to cover the design or work.

New British Patents.

For the benefit of our readers we have arranged for any inquiries relating to Patents, Designs and Trade Marks to be answered, free of all charge, by a Fellow of the Chartered Institute of Patent Agents. Inquiries should be addressed, in the first instance, to the Editor.

Lithographic Trade Review.

NOTES AND NEWS.

LITHOGRAPHERS who attended Mr. Gamble's lecture at Stationers' Hall last week found, in the exhibits of printing shown as well as in the lecture and discussion, a great deal to interest them and much also to help, stimulate and encourage. A very much larger audience is able now to share the benefit of the information and advice contained in that lecture, as we publish it in full, together with a report of the discussion, in this present issue. Whilst the lecturer wisely refrained from pronouncing an early doom upon other printing methods, which obviously have their place and which are capable of indefinite improvement, lithographers cannot but feel "bucked" at the realisation that their particular processes are so centrally placed in the line of progress, and particularly at the big new possibilities which are being opened up by the extension of lithography into such fields as that of letterpress book-production.

WE are able now to report more fully on a very interesting matter to which we have previously referred, namely, the establishment of a new and important business in London. This is Phototype Limited, who have purchased premises at West End-lane, High Barnet. These premises have been converted into a first-rate establishment for the production of printing surfaces for photo-litho offset printing in particular. Certain very large interests in the book-printing trade are going to do a good deal of their printing, we understand, in future by offset rather than as hitherto by typography, and are giving large orders for plates to this new business.

FOR this new house Messrs. Pictorial Machinery Ltd. are supplying all necessary plant for all the necessary processes up to the production of the printing plate. Messrs. Pictorial Machinary have also consented to release two of their experts to join the new company. Mr. Felix Choice—who was with Mr. Corkett in his half-tone block production business in Leicester as far back as 1894, in the interval being with Messrs. Eyre and Spottiswoode for 22 years, and since then again with Pictorial Machinery Ltd.—has accepted the position of managing director of this business, whilst Mr. J. H. Benton, also of Pictorial Machinery, is in charge of the photographic studios.

WITH the most up-to-date apparatus, therefore, and with such skilled assistants, much should be heard of Phototype Limited in the future. We understand the company already has in hand practically twelve months' work for the new plant. We are informed that neither Pictorial Machinery Ltd. nor Mr. Corkett personally has any financial connection with the new business, though the supplying house will doubtless take a keen interest in the new plant, particularly as they deem it to be by far the most perfect plant for the purpose yet established in Great Britain.

JUDGED by the conditions of unemployment in the lithographic section of the printing industry business appears to present a fairly favourable aspect. The figures relating to unemployment show a considerable improvement compared with this time last year, though there has been no very marked change recorded during recent weeks.

THE Amalgamated Society of Lithographic Printers have removed to more commodious and convenient offices at 11, Doughty-street, Theobald's road, W.C.1. The new home of the Society—in keeping with the growing importance of the craft—is up-to-date in every respect and is a great improvement on the old premises at the Memorial Hall. At present the premises comprise the secretary's office, general office, board room and members' reading and recreation room. General satisfaction has been expressed amongst the members regarding the utility of the new headquarters.

THE Conciliation Committee of the Joint Industrial Council is to meet on Wednesday next, the 21st., to consider the question of the manning of flat-bed litho offset machines.

Printing Inks.

Mr. W. Ilston Cox at Stationers' Hall.

There was the customary good attendance at the fourth of the third series of lectures under the auspices of the Stationers Company and Printing Industry Technical Board on Friday at Stationers' Hall, when Mr. W. Ilston Cox, of the firm of Messrs. Shackell, Edwards and Co., Ltd., delivered an address entitled "Printing Inks." The gathering, which was presided over by Mr. Alfred Langley (president of the L.M.P.A.), was fully representative of the various branches of the industry, whilst the many questions put to the speaker at the conclusion of the lecture gave evidence of the interest the subject had evoked. Those present on the platform included Mr. Edward Unwin (past master of the Stationers' Company), Mr. J. R. Riddell and Mr. W. Whyte (secretary, L.M.P.A.).

The chairman, in introducing the lecturer, said the subject of "Printing Inks" was a very fascinating one. Speaking from his thirty five to forty years' connection with the industry, he recalled the fact that they used to divide printing inks into three distinct categories, and call them news, poster and jobbing inks. Nowadays the printing ink factory was like the dispensing department of a large hospital, where there were remedies for all occasions and for all jobs requiring different kinds of treatment. In calling upon Mr. Cox to address the meeting, Mr. Langley said their lecturer that evening was first of all a Liveryman of the Stationers' Company. He was also associated with one of the largest printing ink makers, a firm that bore a great reputation.

In the course of his lecture Mr. Cox dealt first with the early history of printing ink manufacture, and then referred in an interesting manner to the various pigments used. After explaining the medium and method of grinding, the introduction of aniline dyes next came under notice, followed by consideration of the various colour bases, types of inks and progress in manufacture. The difficulties met with in printing were touched upon.

A fuller report of Mr. Cox's paper will appear in a subsequent issue.

Discussion.

Among a score of questions put to the lecturer at the conclusion of the paper were the following:—

Mr. Fuller asked if colours were as good today as the German colours of pre-war days, and also if there was any apparatus for testing permanency on dark winter days.

Mr. J. S. Sunderland inquired why they in this country were not able to standardise their inks with complete confidence, in the same manner as they did on the Continent.

Mr. Edward Unwin wondered if there was any difference in the manufacture of ink today compared with years ago. When he was a lad it was the custom to damp the paper, and he had been told this was to prevent the oil from spreading.

Mr. J. R. Riddell expressed surprise that lithographic printers present should not have asked why some litho ink caused a stain on the paper.

Mr. W. Whyte, speaking as an ex-machine minder, asked the lecturer if he was opposed to the use of dryers, or did he recommend them on certain occasions.

Mr. Radford asked if it was possible for the ink maker to give users a small selection of colours, so that they could obtain for themselves the different tones required.

Mr. Cox Replies.

Mr. Cox, in reply to the questions, said in regard to the quality of colours to day compared with pre-war times, a vast improvement had been made in the British make during the last few years. The dye and lake industry was partially protected, and he thought the pigment and colour manufacturers in this country were to be congratulated on the progress they had made during the last three years or so. In reference to testing the permanency of inks in the winter time, Mr. Cox said there was an apparatus called a Fadeometer, which he then described.

Referring to the statement that standardisation of inks was more advanced on the Continent than in this country, Mr. Cox said English manufacturers were perfectly able to and did standardise any ink desired. Printers who wanted standard inks could get them year after year.

In regard to the damping of paper found necessary in days gone by, Mr. Cox said the greater speed of printing machinery to-day had contributed to the change. The carbons and the varnish used in the manufacture of black ink were substantially the same as they were twenty years ago.

As to dryers their use depended on the paper. If the ink dried satisfactorily it would not need dryers, but if a hard, non-absorbent paper was being used it was quite obvious they would be necessary.

With reference to the running and staining of some lithographic colours, litho inks were often required to be very strong in colour, and sometimes, in order to give what is asked for, more colour is put into the ink than is desirable, with the result that the colour is not entirely gripped by the varnish. The pigment maker was also sometimes at fault. He occasionally attempted to put more dye on the alumina than the base would hold, with the consequence that the dye would not be completely fixed.

As to the blending of colours the speaker said printers could, of course, do this themselves if they wished, but he contended it was not desirable for anyone to start blending colours until he had a knowledge of their origin.

Votes of Thanks.

Mr. Edward Unwin, in moving a vote of thanks to Mr. Cox for his lecture said they had all learned something that evening about the troubles met with in the machine and press room.

Mr. J. R. Riddell, in seconding, said the interesting and illuminating lecture sent his mind back thirty years ago to the manufacture of printing ink in one of the largest factories in this country. He was glad that many of the conditions prevailing at that time were now eliminated. After referring to the success attained in Germany and in America in the standardisation of inks, both for letterpress and litho, Mr. Riddell spoke of the stain often found when using double tone inks. He contended that the cause of the stain on the back of a print arose from the sheet below it. Concluding, Mr. Riddell referred to the collotype process and said he believed they were now—probably as a result of the war—doing in this country some of the finest examples of collotype printing in the world.

The vote of thanks was very heartily accorded.

Mr. Cox, in returning thanks, said printing ink makers would be glad to extend the principle of standardisation as the demand from printers made itself felt. Regarding stain in double-tone inks, he agreed that in some cases it was due to a form of evaporation.

A vote of thanks was given to the chairman on the motion of Mr. Cox.

A reply by Mr. Langley brought a profitable evening to a close.

Openings for British Trade, etc.

Inquiries have been received by the Department of Overseas Trade (Development and Intelligence), 35, Old Queen-street, London, S.W.1, to whom further inquiries should be addressed with the reference number quoted.

CANADA.

A Toronto firm desire to obtain the representation, on a commission or sales basis, of British manufacturers of books, stationery, etc. The whole of Canada is covered, but agencies for Ontario only would be accepted. (Reference No. 639.)

EGYPT.

THE Commercial Secretary at Cairo (Mr. E. H. Mulock) reports that the Ministry of Finance, Egypt, invite tenders to be presented by noon on February 2nd, 1925, for the supply of paper, stationery and various other allied goods required by the Central Stationery Stores Department during the year 1925-6. A copy of the specification, tender form, etc., can be seen by United Kingdom firms interested upon application at the Department of Overseas Trade (Room 41), 35, Old Queen-street, London, S.W.1.

Stationery in South Africa.

Master printers in South Africa are still concerned at the amount of printed books and stationery entering the Union from overseas, and at their last annual meeting the Federation passed the following resolution: "That year books, guide books and directories pertaining to South Africa, all school books of South African authorship or origin, school stationery books, ruled or manufactured, and calendars, printed overseas, should be placed in the Customs tariff schedule as printed matter, and subjected to the full Customs rates. And that, as the Government are endeavouring to foster industries in South Africa, the Federation recommends that the Government give the fullest sympathy to the printing industry by having all school books and stationery manufactured in South Africa." It was further resolved to ask the Government to place on the free list for Customs purposes certain materials at present dutiable, which are used as raw materials by printers, and are not manufactured in South Africa.

PRINTERS who are offered jobs of MUSIC or jobs containing MUSIC should write to us giving fullest possible particulars and *sending us the MS.* We will send estimate for setting up type and making stereo, or for printing the job outright - - -

Representatives also in Australia, India, South Africa, Canada, Norway, Sweden, Finland, etc.

THURSDAY, JANUARY 15, 1925.

Promising Outlook.

THE outlook in the printing trade is distinctly promising and there is a genuine conviction at headquarters that more paper and print will be used this year than in any previous year. First there is the natural and automatic development of business building, which accounts for progressive growth in paper consumption. This alone would mean very little unless supported by improved trade, and fortunately there is every reason for believing that a greater volume of trade will be handled by the England of 1925 than has come our way since the lamentable year of the boom. Printers are pinning much of their faith to the steady development of system and organisation in modern office, warehouse and factory control. With the wider and more common application of paper in industry, trade and commerce on the one hand and increasing resort to advertising and publicity on the other, it is logical to assume that there will be an improved home demand for paper in the near future.

* * *

Boosting Paper and Print.

AN increased consumption of paper and print is a matter of such mutual interest to papermakers, merchants and printers that it is surprising how rarely the joint responsibility for awakening and creating a demand for paper in new directions is mentioned. Individual firms and houses may shoulder a little part of the responsibility themselves and endeavour to educate prospectives in the art of using more paper to advantage. Now and again some enterprising producer will introduce a speciality paper and create his own field, as, for example, bread wrappers, cartons and containers, crêpe paper and similar household appurtenances. Or on a large scale an organisation will launch out on some scheme which promotes paper usage, of which a typical instance is the printers' Federation Costing System. This scheme, devised for printers themselves, has spread its influence over many other industries and has directly, if in no way intentionally, resulted in an ever-widening field of paper and print consumption. Of more recent date is the effort by the printers' Federation to develop the use of publicity by booklets and folders, etc. If there is increased demand for this class of literature, papermakers and merchants will share the benefits of an improved consumption of paper, without having helped very much to bring it about.

* * *

Growth of Collective Advertising.

IT appears probable that in the near future it will be part of the business of employers' organisations to create and maintain a general demand for goods of the sort produced by the members of the organisation. Individual members will run their own campaigns their own way in search of individual orders. Already such methods are in practice in several directions. The fruit brokers plan a general campaign to eat more fruit and the separate merchants or multiple shopkeepers set out to bring some of the increased custom their own way. The organisation representative of printers educates the industrial and commercial community to make use of booklets and the individual printing concern with sufficient enterprise and initiative fits in a private scheme of its own to bring the labours of the Federation to fruition in its own field.

* * *

Unemployment in Paper and Print.

STATISTICS and charts show that employment continues good on the whole. There is a slight improvement in some areas, but in several districts work was suspended for short periods or the workpeople were on short time. With letterpress printers employment, generally, was fairly good in November; there was some improvement at some of the provincial centres, but at Glasgow employment was reported as slack and worse than during the previous month. Employment with electrotypers and stereotypers was good and generally better than in October, although at Manchester a slight decline was reported. In the lithographic printing trade employment generally, continued fairly good With lithographic artists employment was fair in London and Manchester. With bookbinders employment on the whole was fair. There was some improvement in London and at Manchester, though employment was reported as slack at the latter place; at Newcastle employment was bad and worse than in October. Statistics published in the *Ministry of Labour Gazette* show that the percentage of unemployed among workpeople covered by the Unemployment Insurance Acts in the printing and bookbinding trades was 5·2 at November 24th, compared with 5·1 at October 27th and 5·3 at November 26th, 1923. In the paper and paper board-making industry the percentage was 7·3 at November 24th, compared with 7·8 at October 27th and 9·1 at November 26th, 1923. In cardboard boxes, paper bags and stationery, the percentage unemployed at November 25th was 6·4, an increase of 0·1 in males, but a decrease of 0·2 in females as compared with October 27th.

GAMMETER MACHINES.—The Executive Council of the Typographical Association have had under consideration a report from Cardiff on a proposal by the Cardiff City Council to have a Gammeter machine introduced into their offices and worked by girls at salaries ranging from 30s. to 40s. per week. The local master printers protested against the proposal to employ girls, and the T.A. had claimed to work the machine. On its discussion by the Cardiff Council it was stated that several trade unions had these machines in their offices, and in consequence of the statement the Executive Council directed inquiries to be made as to its accuracy.

THE London Waste Paper Co., Ltd., 57-53, Belvedere road, London, S.E.1, have this year succeeded in obtaining the contract for clearance of waste from H.M. Stationery Office.

Printing Competition.

A Preliminary Exhibition by the South-West London Association.

Mr. H. B. Naylor afforded the members of the South-West London Master Printers' Association another very interesting and instructive evening on Tuesday, January 5th, when he once more passed in review a number of specimens of printing which had been sent in. This exhibition had been arranged as a preliminary to the L.M.P.A. Inter-District Competition next May.

Mr. R. B. Simnett, the president of the local association, in introducing Mr. Naylor, commented upon the excellent standard of the exhibits.

Mr. Naylor began by reviewing the development in methods of recording events from the time of the Egyptians, whose hieroglyphics became abbreviated into syllables and then into words, the scribes and illuminators of the Middle Ages being followed by the employment of movable types.

Sane Printers.

Coming to that night's exhibition, Mr. Naylor said it gave evidence of the existence of a very noticeable degree of sanity in the South-West District. (Hear, hear.) He meant from the point of view that the producers had not rushed into all the wonderful type faces which were offered to master printers to-day, but had adopted type faces which were distinctive and decorative to a very great extent. He did not think any printer was justified, merely because a new thing came forward, in rushing to buy it. At the same time they should not for the sake of old associations replace the old type by more of the same character. Every master printer should bring his faces up to date in the form most suited to his business.

Proceeding to examine the exhibits in detail, Mr. Naylor offered very useful comments as to where particular specimens might have been improved. For some he had special words of praise, particularly the colour work by offset and collotype.

Returning again to the letterpress work, Mr. Naylor had special praise for certain booklets which were passed round for general inspection.

Mr. Simnett, in opening the discussion, said the exhibition showed that if any member had difficulty with regard to collotype or offset-litho work, there were members of that Association who could help him out by doing the work for him.

Mr. Whyte, secretary of the London Master Printers' Association, after a tribute to Mr. Naylor's readiness to help, said his own view was that the London trade as they knew it would never be in a satisfactory position until the two sides got a little closer together than they were at this moment. The speaker went on to contest some of the criticisms which Mr. Naylor had offered, and suggested that the trouble most advertising men had was to get both customers and printers to realise the value of blank space.

Collotype and Offset.

Mr. Macbeth, who had brought a number of beautiful collotype examples, said master printers regarded that process as very tricky and frightfully expensive. They had been carrying on collotype for 25 years, and there was no reason why it should not be more commercialised. In many cases it was actually cheaper than other forms of reproduction, but it had one drawback in that it was practically impossible to get more than 1,000 copies per working day, which was rather slow work. The process was particularly adaptable to reproductions of chalk drawings and pencil work.

In answer to Mr. Young the speaker said that in collotype colour work there were four printings as a general rule, the three primaries and a light key. It was, in fact, a modification of the three-colour process.

Mr. Mizen, secretary of the North London Association, pointed out that master printers had to work in unison with the artist, and he thought that fact should be kept in mind.

Mr. Royce (David Allen and Sons), who had exhibited large specimens of lithographic colour work, said the work his firm had shown had been done by the offset process, and he thought their battery of 60 by 40 offset machines was unique. With the changes that were taking place in the trade, especially in regard to the colour processes, machinery became old-fashioned in five to ten years, and a good deal of this expensive plant had accordingly to be scrapped. Even in his time he had seen many changes; three types of lithographic machine had become obsolete and had to be scrapped in order to keep the plant up-to-date.

Referring to the reproduction of an oil painting by Yiend King, Mr. Royce mentioned that it had been drawn throughout by one artist and it took him about ten weeks to complete. It was in thirteen colours and was generally accepted in the trade as a very fine specimen of work. The speaker went on to say that his firm were paying very special attention to photo-litho offset work.

Mr. Wise expressed gratitude that after six years of work together they were able to have such a meeting with an exchange of one another's work. He thought the jobbing printer should seek to make his work as beautiful as opportunity and price permitted, but to do so he would have to work more in conjunction with the artist than had been the case hitherto.

Mr. F. E. Tacey, the vice-president, in moving a cordial vote of thanks to Mr. Naylor, emphasised the desirability of paying tribute to the compositor when he did a particularly good piece of work. He thought it gave the man encouragement.

Mr. E. G. Cole seconded the resolution, which was carried with acclamation.

Mr. Naylor, in returning thanks, said work of the kind they had seen that evening was highly encouraging to all concerned. He went on to speak of the benefit resulting from appreciation of good work, it encouraged the operative to produce good work for the sake of it. Environment played an important part, and it was necessary to make the men contented with their surroundings.

Presentation to Mr. Naylor.

At the conclusion of the meeting, Mr. Simnett, on behalf of the executive and members of the South-West Association, presented to Mr. Naylor an umbrella and an inscribed parchment as an expression of their gratitude for his kindness in coming down on two occasions to give them the benefit of his ripe experience.

Mr. Naylor suitably returned thanks.

Necrology

Re Robert Nicholl, Belfast.

Mr. Robert Nicholl, whose death has taken place at Belfast on his 59th birthday, was a prominent member of the printing trade, having for many years carried on a successful business as printer and stationer at Pottinger's Entry in that city. He served his apprenticeship with Messrs. Robinson Brothers, printers and bookbinders, at Belfast. Later he held responsible positions with Messrs. Hugh Adair, Ltd., and Messrs. Combridge. In 1894 he founded his present business at Iveagh-buildings, and later moved to Pottinger's Entry, where latterly he has been assisted by his son, Mr. Robert Nicholl. Mr. Nicholl was an active member of the Belfast Printing Trades Employees' Association and also of the Federation of Master Printers of Great Britain and Ireland. He was a prominent Freemason, and had accepted several high offices in the craft, and was a generous supporter of the Bloomfield Presbyterian Church.

Mr. A. E. Parsons.

We regret to have to announce the death of Mr. Arthur Edward Parsons, of the firm of Herring, Dewick and Cripps, paper merchants and envelope manufacturers, of 85, Cannon-street, London. Mr. Parsons passed away very suddenly on December 20th. He had early in the day been to business as usual, and after lunch at his home in Kingston he went into the garden, where he suddenly collapsed. The deceased gentleman was very well known in the paper trade, in which he spent all his life. For the past ten years he had been with Messrs. Herring, Dewick and Cripps as a limited partner. In addition to a widow and two daughters, he leaves a son, Mr. Leslie Parsons, who is also engaged with his late father's firm. The funeral took place on Tuesday, December 24th, at Kingston Cemetery, when the firm of Herring, Dewick and Cripps was represented by Mr. Arthur Herring and several of the deceased gentleman's colleagues.

DIVIDENDS AND REPORTS.

BURY PAPERMAKING CO., LTD. (GIGG MILLS).—Statement of accounts for the half-year ended November 29th, 1924, shows a loss on the trading account of £5,104 8s. 6d. After charging that account with interest and depreciation amounting to £4,991 3s. 6d., there is a debit balance of £10,095 12s. for the half-year. This amount is added to the debit balance from last account, amounting to £32,609 2s. 3d., which then shows a debit balance of £42,704 to profit and loss account. At the request of the directors Mr. John Hill has joined the board.

NEW COMPANIES.

SIMPSON, MANSFIELD AND CO., LTD.—Capital £3,000, in £1 shares; to acquire the business of designers, engravers, die-sinkers, relief stampers and copperplate printers, etc., carried on at 60, 61, Red Lion street, Clerkenwell, as "Simpson, Mansfield and Co." (cardboard box manufacturers, etc.).—Debenture dated December 16th, 1924, to secure £250, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Mrs. A. Einbinder and Mrs. B. Einbinder, both of Mentmore Works, Mentmore Terrace, London-fields, E.8.

RECEIVER APPOINTED OR RELEASED.

MCARA PRINTING CO., LTD. (London).—A. W. Hulls, of 46, Peartree-street, Goswell-road, E.C.1, was appointed Receiver and Manager on December 29th, 1924, under powers contained in debentures dated August 1st, 1922.

ROBERT ROBERTS (PRINTER), LTD. (Cardiff)—W. R. Gresty, of Cardiff, chartered accountant, was appointed Receiver on December 29th, 1924, under powers contained in debenture dated February 9th, 1922.

INTAGLIO PATENTS, LTD. (London).—R. M. Butler, of 15, Queen street, Cheapside, E.C., was appointed Receiver on December 30th, 1924, under powers contained in mortgage debentures dated October 11th, 1913, and May 27th, 1914.

BANKRUPTCIES, etc.

Re RUBY PATERSON, stationer, Folkestone.—At Bankruptcy-buildings, Carey-street, W.C., on January 7th, the first meeting of the creditors was held of Ruby Paterson (wife of Samuel Douglas Paterson) residing at 16, Tontine-street, Folkestone, and carrying on business at 16, Tontine-street, and 5, George-lane, Folkestone, under the name of "Paterson and Hogben," stationer and fancy goods dealer. The receiving order was made on December 22nd last on the debtor's own petition, and her statements of affairs disclosed gross liabilities of £1,356, of which £1,271 was expected to rank for dividend. The net assets were estimated to produce £523. The causes of failure alleged by debtor were: "Bad summer seasons (1923-1924); overstocking; and heavy working expenses." The creditors resolved that Mr. E. H. Hawkins, Incorporated Accountant, 4, Charterhouse-square, E.C., be appointed trustee of the estate, assisted by a committee of inspection, consisting of Mr. C. J. T. Penrice (Folkestone); Mr. Geo. Doulton (Folkestone); and Mr. P. W. J. Surridge (London).

Printers' Managers & Overseers (PARENT) ASSOCIATION.

New Year Opens with Concert.

On the occasion of the first meeting of the new year, held at the "Old Bell," Holborn, on Tuesday of last week, the Printers' Managers and Overseers (Parent) Association had but a short business agenda to deal with, and devoted the greater part of the evening to a smoking concert. The president, Mr. R. H. Berry, was in the chair, and there was an excellent attendance—although numbers, as usual, were much larger towards the middle of the proceedings than at either the beginning or the end of the meeting.

New Presidential Badge.

After the minutes had been read and adopted, the general secretary announced that the Council had met that evening and had decided that the presidential badge, which had now been obtained, should be presented on this occasion.

The vice-president, Mr. A. H. Wilson, then invested the president with the handsome new insignia of office, congratulating him upon being the first president to receive it and at the same time expressing regret that previous presidents had not been accorded similar recognition.

Mr. Berry, who mentioned that he had not personally taken any part in the movement for the obtaining of a presidential badge, said he would take pride in wearing the emblem at the various trade functions he attended during his term of office.

The president next spoke a few words of welcome to a member from abroad present at the meeting, namely, Mr. R. J. Thomas, of Colombo, Ceylon.

Mr. Thomas briefly responded.

Tribute to Mr. Bowerman.

The president expressed the Association's sincere regret at the recent accident to their good friend, Mr. C. W. Bowerman, M.P., whom he spoke of as "one of the best esteemed men in the whole of the printing trade." The secretary, he said, had already written to convey to Mr. Bowerman the sympathy of the members of the Association. On the day of his accident Mr. Bowerman had fulfilled several engagements on behalf of the trade, and when taken ill was on his way home after attending a printers' pension concert. Surely it was time some very prominent men in the printing industry should recognise the principle of the "limitation of overtime."

Proceeding to refer also to several members who are on the sick list, Mr. Berry mentioned Mr. J. J. Smith, now very ill, Mr. J. Acton, who is making steady progress after an operation, Mr. G. H. T. Freeman, who fails to make the progress desired, and Mr. C. J. Gray, about whose condition reports are far from satisfactory.

Two candidates were elected into the Association, namely, Mr. C. L. Barnard (Cornwall Press, Stamford-street, S.E.—overseer, letterpress machine department); and Mr. W. T. K. Tokeley (Messrs. Love and Malcolmson, Ltd.—overseer, letterpress machine department). The former was present and received a personal welcome from the president.

At this point the president announced that the Association had several of its members on the unemployed list, and he called for the assistance of any present who might be able to help them in finding suitable employment. It speaks well, both for the scope of the Association and for the fraternal spirit which prevails in it, that before the meeting closed the president was able to report that several offers of employment had been received.

In accordance with a recommendation of the Council, Mr. T. Ellwood was co opted to fill a vacancy on the Council created by the resignation of Mr. C. W. Brown. This concluded the evening's business.

A Good Concert.

The concert which followed proved a very acceptable one, and some of the items were of exceptionally fine quality. In songs of more serious character Mr. Claude Thorogood (baritone) and Mr. William Crowley (tenor) acquitted themselves in very meritorious fashion, contributing not only heartily applauded solos, but also some delightful duets. The humorous side of the proceedings was sustained by Mr. Fred Emerton, Mr. Barclay Browne and Miss Nora Blakemore, all of whom were received very cordially. Mr. Douglas Berridge ably presided at the piano.

The president characterised the concert as one of the best the Association had had, and at his suggestion a hearty vote of thanks was proposed and seconded by Mr. J. French and Mr. S. A. Dawson respectively.

After brief responses from Mr. Arthur Paul and Mr. Berridge the meeting was brought to an end by the joining of hands and the singing of "Auld Lang Syne."

Chas. Marsden & Sons, Ltd.

"It is understood from the receiver that the possibility of a surplus becoming available for distribution in the liquidation is extremely remote."

These words from the senior official receiver afford little comfort to the holders of the £780,000 of ordinary and preference share capital of Charles Marsden and Sons, Ltd. They are set out in the observations accompanying the summary of the statement of affairs of the company as at the date of appointment of the receiver for the debenture holders, and as officially published.

Calendars, etc., Received.

THE CROSS PAPER FEEDER CO. are conveying the season's greetings to their friends by issuing a very beautiful calendar containing reproductions of "The Grand Canyon of the Yellowstone," by Thomas Moran, one of the greatest American landscapists. The work is in nine colour tinto-gravure and portrays the awe-inspiring grandeur of nature in all its majestic beauty. The original occupies a prominent place in the exhibits of the National Gallery of Art in Washington. The Cross Paper Feeder Co. are to be congratulated upon their taste, selecting such a fine piece of work which is devoid of any advertising matter except a few lines devoted to the name and address of the company. A monthly date tab is attached.

THE CITY ELECTRICAL CO., London, send us a monthly tear-off calendar which is characterised by large sheets bearing dates in bold type in black and red.

MESSRS. W. G. MONNERY AND CO., LTD., of 15 and 16, Thavies-inn, E.C., have issued a very useful monthly tear-off calendar, each sheet of which bears a month's dates boldly displayed and also the complete year's dates in miniature.

A DELIGHTFUL rural scene, "The Hay Wain," by Constable, in colours, forms the illustration on a dainty pad wall calendar issued by Messrs. W. S. Cowell, Ltd., printers, lithographers and stationers, of Ipswich, London and Felixstowe. The design, colour work and letterpress show excellent craftsmanship whilst the day's tear-off carries an item of wit or wisdom as well as the date in bold characters.

MR. E. W. HOUSER, president of the American Photo-Engravers' Association, sends new year greetings by means of a simple but choicely designed folder which is an admirable example of skill in the allied crafts of engraving, embossing and printing.

NEATNESS is the distinguishing character of the calendar produced by Messrs. Chivers and Chivers, Ltd., printers and bookbinders, of 36, Plough-road, Battersea. A clear photograph of the firm's premises is balanced by the date pad, and the printing throughout is red and black on a stout board is striking in its simplicity.

WITH the familiar butterfly to adorn it, a neat little calendar for 1925 is issued by Messrs. Samuel Jones and Co., Ltd.

A WELL-DESIGNED and well-printed greeting card reaches us from the Instituto Catalan de las Artes del Libro, Barcelona.

MESSRS. GROSVENOR, CHATER AND CO., LTD., are sending to their friends with their compliments a useful desk scribbling pad and diary. There is a page for each week in the year, with space for memoranda and engagements. Every leaf also contains the dates for the whole current month.

MESSRS. R. L. LUNDGREN, LTD., 113, Queen Victoria-street, London, E.C.4, have issued with their compliments the customary calendar, which, as hitherto, bears excellent photographs of the late Mr. R. L. Lundgren, the present Major C. W. Lundgren and the latter gentleman's three boys. In addition to the calendar, Messrs. Lundgren are sending to their friends a neat season ticket and treasury note holder, which fits very conveniently into the waistcoat pocket.

MR. JOHN E. MOSS, papermakers' agent and export shipper, 22, Ivy-lane, Newgate-street, London, have sent out a handy pocket diary for 1925. The cover, bound in crocodile leather, has a convenient place for the season ticket, and there is, in addition to the diary proper, a host of useful postal and other information. "Champion" blotting is mentioned inconspicuously in a gilt device on the front.

THE diary for 1925 presented by Messrs. Costa and Cuthill, Ltd., paper merchants, etc., York House, 14, York-place, Edinburgh, will be greatly appreciated by the recipients, as its application is well suited to the requirements of the business man. A page is devoted to the dates of each month for engagements, and a feature is the monthly index in gilt letters covering two pages to the week for daily entries, etc. In addition, blank pages are also provided for memoranda, ruled monthly sheets for cash account, and pages alphabetically indexed for addresses, etc. Full Post Office information is presented, also a mass of useful information and tables. The diary is encased in a strong, flexible leather cover, which is adaptable for refills.

FROM Wycombe Marsh Mill, 414, comes a very striking calendar, with the appropriate greeting, "prosperity and good luck in 1925." Measuring 20 ins. by 14 ins., it has been produced at considerable cost. The stout board has a background of black, from which stands out boldly the white embossed lettering of the text. On either side of the daily date pad, which itself measures 4¼ ins. by 5½ ins., there are panels illustrating the tints embodied in the wide range of papers produced at this mill, which include tinted banks, extra fine linens, fine printings, imitation parchments, "grass bleached" tissue, and cartridges. Wycombe tinted banks are stocked in all standard sizes and weights, and these particulars are printed on the calendar, which will be an ornament in any office or works.

MESSRS. LEONARD SPALDING AND CO., 24, Wardrobe Chambers, Queen Victoria-street, E.C., send a useful scribbling pad mounted on a stiff board. A raised ledge at the top contains a neat calendar for 1925.

MESSRS. JOHNSTON, HORSBURGH AND CO. have adopted a unique device to convey greetings to their friends. The Buxton "Keytainer," a calf leather case fitted with ingenious swivel hooks on which to hang keys, is a neat and beautifully finished article, folding into dimensions of 2¼ ins. by 3¾ ins.

MR R. K. BURT, papermakers' agent, 19 to 21, Farringdon-street, London, has chosen another of his own beautiful photographs to adorn his 1925 calendar. It represents a sunset on the Orwell, an artistic effect, below which are the monthly tear-off slips.

Trade Notes.

PRINTERS' AMALGAMATION. — Particulars have been published, for information only, of the Argus Press, which has a capital of £300,000, divided into 100,000 7 per cent. cum. pref. shares and 200,000 ordinary shares of £1 each. As already intimated on our commercial page, the company was formed on January 2nd last to take over two London printing, etc., businesses, the Argus Printing Co. and Crowther and Goodman, Ltd. The purchase price is £300,000, payable as to £100,000 in cash and £200,000 by the allotment of the above mentioned 200,000 ordinary shares.

THE premises of Messrs. Dales, hardware dealers, paper merchants, and printers, of Burslem, Staffs, were badly damaged by fire last week.

COUPON PRINTING APPEAL.—The appeal was allowed at London Sessions on Saturday of John Robertson against a conviction and fine of 10 guineas and five guineas costs at Lambeth Police Court for printing coupons of a ready-money football business. Mr. Eustace Fulton, for the respondent, said that a man was arrested for street betting, and in his possession were found coupons printed by defendant. Mr. St. John Hutchinson, for the appellant, said he supplied the coupons to a bookmaker for credit betting. He had an agreement with this person whereby the slips were to be used only for credit betting. Appellant did not print the slips for ready-money betting.

THE Federation of Master Printers has just issued a neat booklet with map, as a preliminary announcement of the annual Federation meetings, to be held this year at Buxton, Derbyshire, from May 9th to May 13th.

MR. G. W. JONES, of the "Sign of the Dolphin," who was to have lectured at the West and North-West London Master Printers' meeting at Westbourne Park Institute on Monday next, January 19th, will unfortunately be unable to be present. The meeting has therefore been postponed.

BOLTON Master Printers' Association holds its annual dinner at the Pack Horse Hotel, Bolton, on Wednesday next, the 21st instant.

THE first meeting of the Wrexham District Committee of the J.I.C. will be held next Thursday at the Wynnstay Arms, Wrexham.

PLYMOUTH Corporation Electricity Committee has received a resolution passed by the Typograpical "chapel" of the *Western Morning News* regarding the practice of extinguishing the street lamps at midnight during the summer time, and asking the committee to revert to pre-war conditions in regard to this matter.

NEWSPAPER PRESS FUND.—Mr. D. J. Ryan, the secretary of the Cork district of the Newspaper Press Fund, reports that every journalist in Cork qualified for membership had joined the Fund. During the past year the head office had distributed £13,861 in grants and pensions, but the Cork district had had no occasion to forward any application for benefit.

A NEW exhibit which has been placed on view at the Science Museum, South Kensington, illustrates the process used in the recent experiments conducted by the Marconi Co., in conjunction with the Radio Corporation of America, in the transmission of photographs by wireless.

A FINE exhibition of playing cards, including some of the rarest specimens of English cards from the collection made by Mr. Henry D. Phillips, a former Master of the Makers of Playing Cards Company, are now on view at Guildhall. The packs are all complete and extend over nearly three centuries. Some of them bear illustrations, and most of them are of educational and historical interest.

THE Publicity Club of London Cup, awarded for the most signal achievement in advertising during 1924, has been won by Mr. C. Harold Vernon, chairman of District 14, Associated Advertising Clubs of the World.

The January issue of the *Nineteenth Century* contains, under the title of "The Press Association and its Work," an excellent description of the methods by which news is collected nowadays and passed on through the newspapers to the puplic. Mr. H. C. Robbins, the writer, is joint manager of the Press Association, to the building up of which his father, the late Sir Edmund Robbins, devoted the greater part of his life and energies.

THE death has occurred, at Bromley, Stocksfield, of Mr. George Coates Kirtley, at the age of 74. Deceased had for the past 27 years represented Messrs. R. Robinson and Co., Ltd., printers and stationers, Clavering-place, Newcastle.

MR. HARRY JONES died on Sunday after a few days' illness at his residence at Herne Hill, at the age of 58. For the last six months or so he had been Parliamentary correspondent of the *Daily Chronicle*, with which, except for an interval with the *Daily News*, he had been associated for over 16 years.

THE death occurred suddenly last week of Mr. Seth Evans, J.P., of New Mills, the oldest journalist in the High Peak.

MR HENRY CHARLES HOGAN, editor of the *Record* and a member of the National Assembly of the Church of England, died suddenly last week at Tooting, in his 65th year.

MR. JAMES CHARLES WHEAT, of Nottingham, printer, who died on September 15th, left estate of the gross value of £5,849, with net personalty £3,841.

MR. CHARLES HENRY PICKLES, 69, of Horsforth, near Leeds, founder of the firm of wholesale newsagents, publishers, and stationers, left £54,345 (net personalty £27,876).

THE late Mr. Arthur Willesley Woodbridge, of The Haven, Waring-road, Beaconsfield, Bucks, London editor of the *Yorkshire Post*, formerly editor of the *Sunday Chronicle*, and afterwards of the *National News*, left £8,457 (net personalty, £1,382).

THE late Mr. George Wm. Chadwick, Cheadle Heath, Cheshire, and late of Manchester, paper merchant and manufacturer, left £33,779.

THE late Mr. James Barr, author and journalist, who died at Putney on March 21st, 1923, aged 61, left property valued for probate at £91 gross, with net personalty £31.

THE late Mr. Frederick Grundy (55), of Kensington, W., journalist and art critic, left £9,188 (net personalty, £7,988).

THE *South London Press* published with its issue of January 9th a special Diamond Jubilee Section. The section included a number of articles by public men, dealing with the progress and development of South London during the last 60 years, and some interesting reproductions of old prints and drawings.

PAPER mills on the River Medway near Maidstone are said to have been inundated by the recent floods in that district.

THE seventh annual report of the New Zealand Department of Industries and Commerce shows that the value of the output of printing, publishing and bookbinding undertakings in the Dominion during 1923 was £3,531,936, comparing with £1,067,827 in 1906.

Trade Union Matters.

N.U.J. AND SUPERANNUATION. — The Committee of the National Union of Journalists publish particulars of a self-contained voluntary scheme of superannuation, which will take the place of the proposed compulsory scheme which was submitted early in 1924. Under the new scheme a unit of pension will cost 5s. per month, and at the age of 60 a member who has contributed for one unit will be entitled to a pension of £24 16s. per annum or a cash payment of £275 15s. Contributions may be continued until the age of 65, when the benefits will be proportionately higher. Any number of units may be taken out by a member, and only members of the Union will be eligible to join the scheme. The scheme will be registered under the Provident Societies Act.

TYPOGRAPHICAL ASSOCIATION EXECUTIVE.—The Typographical Association invite nominations for the Executive Council for the ensuing twelve months. The Council will consist of 22 members, and a list of districts is circulated in which nominations may be made for separate representation. Any district has the right to nominate members for the position of machinemen's delegates. Nominations must be made before February 23rd, and the elections will take place in March.

Mr. R. A. Austen-Leigh Honoured.

Mr. R. A. Austen-Leigh, M.A., who was president of the Federation of Master Printers of Great Britain and Ireland for the year 1922–23, was on Tuesday presented with his portrait painted by Mr. Charles Shannon, R.A., as a mark of appreciation of his services to the printing industry. Lt.-Col. H. Rivers Fletcher, the immediate past president, in referring to Mr. R. A. Austen-Leigh's work, commented upon his efforts in connection with the introduction of correct costing methods into the industry, his trips to America, Holland, Belgium, France and Sweden in the interests of the international organisation of employers, and his interest in the educational work of the Stationers' Company of London.

Mr. W. B. Wykes, president of the Federation, in handing over the portrait, which is a splendid example of Mr. Shannon's work, alluded to the many important offices Mr. Austen-Leigh had occupied, including the presidencies of the Federation of Master Printers, the London Master Printers' Association and the East Anglian Alliance.

Mr. Austen-Leigh, in acknowledging the gift, expressed the pleasure it had given him to do anything to serve the great and historic craft of printing.

Personal.

SIR ARTHUR SUTHERLAND, of Newcastle-on-Tyne, has given £1,000 to found a Lady Sutherland annuity in connection with the local Governesses' Aid Society.

MR. T. E. NAYLOR gave a "Victory Social" at Newington Public Hall, Walworth, on Monday, when over a thousand supporters and friends were present.

MESSRS. W. B. WYKES and A. E. Goodwin, president and secretary respectively of the Federation of Master Printers, are to attend gatherings of the South-Western Alliance at Bristol on Monday next, and on the Tuesday will be at Cardiff for meetings of the South-Western Alliance.

MR. J. D. WISE attended a joint meeting of the North London Master Printers' Association and the East and North-East M.P.A. at Dalston on Tuesday evening, delivering a cheering and helpful address on "How to be Happy though a Printer."

AT the annual dinner of the Yorkshire Centre of the Printers' Managers and Overseers Association, at Leeds on Saturday last, Mr. R. H. Berry (president, Parent Association), Mr. F. Scouler (Manchester), Mr. W. E. Martin and Mr. C. H. Prestidge (Birmingham), Mr. E. J. Knights (North Midlands), and Mr. E. W. Whittle, the general secretary, were amongst the guests.

IN respect to a query as to who is the oldest living trade unionist, Mr. H. Wilson Howes, secretary of the Printing Machine Managers' Trade Society, writes to the *Daily Herald* to say that, after searching the records, he finds that Mr. T. James, No. 1 on the register of members, joined the Society in 1852. Mr. James is in his 94th year.

MR. F. NAYLOR (of Messrs. Beck and Inchbold) has been elected president of the Leeds Typographical Society for 1925.

MR. F. M. COLLIS, of the London Society of Compositors and Association of Correctors of the Press, sails for Australia this month.

SIR T. VANSITTART BOWATER, BT., M.P., has left London for Monte Carlo.

MR. W. MONKHOUSE is to preside at the annual meeting of the Drawing Office Materials Manufacturers' and Dealers' Association on January 21st. The annual dinner follows in the evening.

AN International Book Fair will be held in Florence in April in which 15 nations, including Great Britain, are taking part.

of the primaries can be remedied, and the necessary grey and light tints can be obtained as well as the full strength of the solid colours. Whatever success is obtained in photo-litho colour work is only by dint of an immense amount of labour in retouching, so that many jobs cost as much is if drawn by hand. Sometimes it is found best to put down some of the plates by photo methods, and draw in the other colours by hand with the aid of "set-offs."

It may be that this difficulty of doing process colour work by litho printing is due to the inadequacy of the three-colour method. It is perhaps a bold thing to say that the three-colour theory is all wrong, as Mr. Zander, Mr. Bawtree and others have done. They claim that there must be four colour separations and four printings. The idea of adding a fourth printing is as old as the tri-colour process, but the fourth printing suggested is usually a black or grey. Mr. Zander's Complementary Colour Process consisted in modifying the red, yellow and blue inks, and adding green, which also involved altering the filters. Mr. Zander's claim was that he secured a purer representation of such colours as magenta, purple, emerald green, ultramarine blue and violet, which are imperfectly rendered or not reproduced at all in the three-colour process.

Mr. Bawtree's Colour Theory.

In the current volume of "Penrose's Annual" there is an article by Mr. A. E. Bawtree, illustrated by an example of what he describes as "A Revision of the Principles of Three-colour Half-tone Reproduction." Mr. Bawtree claims that the principal cause of inefficiency of the three-colour process lies in its being founded upon incorrect principles, and he explains his reasons for that conclusion in the following way: It is customary to arrange the colours in the form of a circle of six divisions, violet, green, and red being placed at angles of 0, 120, and 240 degrees respectively. These are the colours of the filters. Between them are placed blue, yellow, and magenta at angles of 60, 180 and 300 degrees, these being the colours of the inks to be used. It is known that violet light mixed with green light yields blue light; also that violet light added to red light yields magenta; and it has generally been accepted that similarly green light added to red makes yellow. The principle of the three-colour process consists in taking the image through violet, green, and red filters, and printing the impressions with inks of hues diametrically opposite to these colours in the circle. Now, recent researches have shown that whilst it is true that the stronger and purer are the violet and green the deeper is the blue produced by the combination, also the stronger the violet and red the deeper is the resulting magenta; nevertheless, when the green and red are similarly strengthened the resulting yellow is really paler, until a point is reached where, with very pure colours, white light is yielded and not yellow at all. Yellow, therefore, is as much a primary colour as violet, green and red, and a different colour circle must be adopted. This requires to be divided into eight segments, with violet, green, yellow and red at angles of 0, 90, 180 and 270 degrees respectively, and between these are blue, citron, orange and magenta respectively, at 45, 135, 225 and 315 degrees. Since it is essential for the subtraction process of colour printing that the inks should reflect two colours each, these latter four segments of the circle must be adopted for the ink hues; further, as it is also essential that the filter colours should be those diametrically opposite the inks, an entirely new set of filters must be used.

Mr. Bawtree has worked out the necessary inks and filters to comply with these conditions, and several firms have taken up the new process; but it has not yet been sufficiently put into practice to enable its possibilities to be fully demonstrated. The original which is reproduced in "Penrose's Annual" was selected by a leading colour printing firm as being the most difficult it would be possible to find. I think you will admit that the picture has some good qualities, whatever faults it may have. I have not had time to go more fully into this process, and I prefer to reserve final judgment on it until it is fully tried out, but the arguments for it seem very convincing.

Anyone who wants to study this question of three-colour versus four-colour can do so in Von Hubl's work on "Three-colour Photography."

Colour Registration Difficulties.

One of the greatest difficulties in utilising photo-processes for lithographic colour printing is that of securing good register, and the difficulty is intensified with the number of colours to be printed, as well as by the number of repeats to be put down on the sheet, for there are so many chances of going wrong. The lens may not be perfectly colour-corrected; the colour filters may introduce errors; the camera may be out of parallelism in itself or with the copy-board. Even when perfectly fitting negatives are obtained there are further troubles in printing down on to the zinc plate, if more than one print of the same subject has to be laid down. To do it by hand is almost hopeless, even by the most skilful, and the matter is not much simplified, if at all, by retransferring.

In America they appear to have come to the conclusion that the only solution of this difficulty is in the use of mechanical devices, and there are several equipments by different makers for laying down and repeating colour work in exact register. Some of the stepping machines are run by electric motor, the mechanism making the necessary steps and timing the exposure. The images are thus printed down all in the same strength, and when the plates are put on the machine there is no difficulty in getting register, for it is merely a question of adjusting the lay of the sheet. The register and uniformity of colour obtained is really wonderful. I have seen large sheets, 60 by 40 in., covered with repeats of small labels in several colours, and the severest trade critic would hardly be able to find fault with the results. No transferer could hope to compete with the speed and accuracy with which such work is done.

Not only label work is done by these mechanical devices, but also high-class colour work in large sizes. The results

CAPACITY

THE profit earning value of a composing machine depends upon its capacity.

The Intertype operator can have twelve faces at his disposal without leaving his chair.

When it is necessary to change a magazine it can be removed and another one substituted in less than ten seconds.

These are some of the advantages which make the Intertype the most profitable machine of its class, and account for its outstanding success.

We can easily show you how the Intertype can increase YOUR profits.

Trade Notes.

PRINTERS' AMALGAMATION. — Particulars have been published, for information only, of the Argus Press, which has a capital of £300,000, divided into 100,000 7 per cent. cum. pref. shares and 200,000 ordinary shares of £1 each. As already intimated on our commercial page, the company was formed on January 2nd last to take over two London printing, etc., businesses, the Argus Printing Co. and Crowther and Goodman, Ltd. The purchase price is £300,000, payable as to £100,000 in cash and £200,000 by the allotment of the above mentioned 200,000 ordinary shares.

THE premises of Messrs. Dales, hardware dealers, paper merchants, and printers, of Burslem, Staffs, were badly damaged by fire last week.

COUPON PRINTING APPEAL.—The appeal was allowed at London Sessions on Saturday of John Robertson against a conviction and fine of 10 guineas and five guineas costs at Lambeth Police Court for printing coupons of a ready-money football business. Mr. Eustace Fulton, for the respondent, said that a man was arrested for street betting, and in his possession were found coupons printed by defendant. Mr. St. John Hutchinson, for the appellant, said he supplied the coupons to a bookmaker for credit betting. He had an agreement with this person whereby the slips were to be used only for credit betting. Appellant did not print the slips for ready-money betting.

THE Federation of Master Printers has just issued a neat booklet with map, as a preliminary announcement of the annual Federation meetings, to be held this year at Buxton, Derbyshire, from May 9th to May 13th.

MR. G. W. JONES, of the "Sign of the Dolphin," who was to have lectured at the West and North-West London Master Printers' meeting at Westbourne Park Institute on Monday next, January 19th, will unfortunately be unable to be present. The meeting has therefore been postponed.

BOLTON Master Printers' Association holds its annual dinner at the Pack Horse Hotel, Bolton, on Wednesday next, the 21st instant.

THE first meeting of the Wrexham District Committee of the J.I.C. will be held next Thursday at the Wynnstay Arms, Wrexham.

PLYMOUTH Corporation Electricity Committee has received a resolution passed by the Typograpical "chapel" of the *Western Morning News* regarding the practice of extinguishing the street lamps at midnight during the summer time, and asking the committee to revert to pre-war conditions in regard to this matter.

NEWSPAPER PRESS FUND.—Mr. D. J. Ryan, the secretary of the Cork district of the Newspaper Press Fund, reports that every journalist in Cork qualified for membership had joined the Fund. During the past year the head office had distributed £13,861 in grants and pensions, but the Cork district had had no occasion to forward any application for benefit.

A NEW exhibit which has been placed on view at the Science Museum, South Kensington, illustrates the process used in the recent experiments conducted by the Marconi Co., in conjunction with the Radio Corporation of America, in the transmission of photographs by wireless.

A FINE exhibition of playing cards, including some of the rarest specimens of English cards from the collection made by Mr. Henry D. Phillips, a former Master of the Makers of Playing Cards Company, are now on view at Guildhall. The packs are all complete and extend over nearly three centuries. Some of them bear illustrations, and most of them are of educational and historical interest.

THE Publicity Club of London Cup, awarded for the most signal achievement in advertising during 1924, has been won by Mr. C. Harold Vernon, chairman of District 14, Associated Advertising Clubs of the World.

The January issue of the *Nineteenth Century* contains, under the title of "The Press Association and its Work," an excellent description of the methods by which news is collected nowadays and passed on through the newspapers to the puplic. of the primaries can be remedied, and the necessary grey and light tints can be obtained as well as the full strength of the solid colours. Whatever success is obtained in photo-litho colour work is only by dint of an immense amount of labour in retouching, so that many jobs cost as much is if drawn by hand. Sometimes it is found best to put down some of the plates by photo methods, and draw in the other colours by hand with the aid of "set-offs."

It may be that this difficulty of doing process colour work by litho printing is due to the inadequacy of the three-colour method. It is perhaps a bold thing to say that the three-colour theory is all wrong, as Mr. Zander, Mr. Bawtree and others have done. They claim that there must be four colour separations and four printings. The idea of adding a fourth printing is as old as the tri-colour process, but the fourth printing suggested is usually a black or grey. Mr. Zander's Complementary Colour Process consisted in modifying the red, yellow and blue inks, and adding green, which also involved altering the filters. Mr. Zander's claim was that he secured a purer representation of such colours as magenta, purple, emerald green, ultramarine blue and violet, which are imperfectly rendered or not reproduced at all in the three-colour process.

Mr. Bawtree's Colour Theory.

In the current volume of "Penrose's Annual" there is an article by Mr. A. E. Bawtree, illustrated by an example of what he describes as "A Revision of the Principles of Three-colour Half-tone Reproduction." Mr. Bawtree claims that the principal cause of inefficiency of the three-colour process lies in its being founded upon incorrect principles, and he explains his reasons for that conclusion in the following way: It is customary to arrange the colours in the form of a circle of six divisions, violet, green, and red being placed at angles of 0, 120, and 240 degrees respectively. These are the colours of the filters. Between them are placed blue, yellow, and magenta at angles of 60, 180 and 300 degrees, these being the colours of the inks to be used. It is known that violet light mixed with green light yields blue light; also that violet light added to red light yields magenta; and it has generally been accepted that similarly green light added to red makes yellow. The principle of the three-colour process consists in taking the image through violet, green, and red filters, and printing the impressions with inks of hues diametrically opposite to these colours in the circle. Now, recent researches have shown that whilst it is true that the stronger and purer are the violet and green the deeper is the blue produced by the combination, also the stronger the violet and red the deeper is the resulting magenta; nevertheless, when the green and red are similarly strengthened the resulting yellow is really paler, until a point is reached where, with very pure colours, white light is yielded and not yellow at all. Yellow, therefore, is as much a primary colour as violet, green and red, and a different colour circle must be adopted. This requires to be divided into eight segments, with violet, green, yellow and red at angles of 0, 90, 180 and 270 degrees respectively, and between these are blue, citron, orange and magenta respectively, at 45, 135, 225 and 315 degrees. Since it is essential for the subtraction process of colour printing that the inks should reflect two colours each, these latter four segments of the circle must be adopted for the ink hues; further, as it is also essential that the filter colours should be those diametrically opposite the inks, an entirely new set of filters must be used.

Mr. Bawtree has worked out the necessary inks and filters to comply with these conditions, and several firms have taken up the new process; but it has not yet been sufficiently put into practice to enable its possibilities to be fully demonstrated. The original which is reproduced in "Penrose's Annual" was selected by a leading colour printing firm as being the most difficult it would be possible to find. I think you will admit that the picture has some good qualities, whatever faults it may have. I have not had time to go more fully into this process, and I prefer to reserve final judgment on it until it is fully tried out, but the arguments for it seem very convincing.

Anyone who wants to study this question of three-colour versus four-colour can do so in Von Hubl's work on "Three-colour Photography."

Colour Registration Difficulties.

One of the greatest difficulties in utilising photo-processes for lithographic colour printing is that of securing good register, and the difficulty is intensified with the number of colours to be printed, as well as by the number of repeats to be put down on the sheet, for there are so many chances of going wrong. The lens may not be perfectly colour-corrected; the colour filters may introduce errors; the camera may be out of parallelism in itself or with the copy-board. Even when perfectly fitting negatives are obtained there are further troubles in printing down on to the zinc plate, if more than one print of the same subject has to be laid down. To do it by hand is almost hopeless, even by the most skilful, and the matter is not much simplified, if at all, by retransferring.

In America they appear to have come to the conclusion that the only solution of this difficulty is in the use of mechanical devices, and there are several equipments by different makers for laying down and repeating colour work in exact register. Some of the stepping machines are run by electric motor, the mechanism making the necessary steps and timing the exposure. The images are thus printed down all in the same strength, and when the plates are put on the machine there is no difficulty in getting register, for it is merely a question of adjusting the lay of the sheet. The register and uniformity of colour obtained is really wonderful. I have seen large sheets, 60 by 40 in., covered with repeats of small labels in several colours, and the severest trade critic would hardly be able to find fault with the results. No transferer could hope to compete with the speed and accuracy with which such work is done.

Not only label work is done by these mechanical devices, but also high-class colour work in large sizes. The results

CAPACITY

THE profit earning value of a composing machine depends upon its capacity.

The Intertype operator can have twelve faces at his disposal without leaving his chair.

When it is necessary to change a magazine it can be removed and another one substituted in less than ten seconds.

These are some of the advantages which make the Intertype the most profitable machine of its class, and account for its outstanding success.

We can easily show you how the Intertype can increase YOUR profits.

Digitized by Google

achieved by the Huebner-Bleistein apparatus are really marvellous, and this system has been long enough in use for its practical value to be fully determined. The Ogden and Directoplate are other machines having a similar object, and their purpose is attained very successfully, though they are not on the same large scale, nor have they the same degree of completeness as the Huebner-Bleistein apparatus.

Unfortunately the price of these mechanical devices practically puts them out of the field of lithography in this country, because British printers do not have the long runs which would justify the expense. In America, where the jobs run into millions of copies, and where labour costs are so high, it pays to have such machines, no matter what they cost. Here it would not be possible, I fear, to earn the interest on the capital outlay. I do not know exactly what is the price of the Huebner-Bleistein outfit. Various figures have been mentioned, ranging from £6,000 to £15,000. A lot of work would be required to earn the interest on such figures and to pay the expense of running the plant. Besides, it would probably be difficult to find men who could straightway be turned on to such machines, and be expected to make good from the first. It would take time to train them, and whilst that was being done money would be rapidly going out without immediate return. I am afraid we must be content to plod along in our old way, dependent on skill of craftsmanship rather than on mechanical contrivances. We may envy our American confrères in the wonderful mechanical facilities they possess, but they themselves are ready to acknowledge the excellence of British workmanship. We have the satisfaction of achieving something that is worthy of the making, which bears the impress of clever handicraft and has not the formality of a machine-made product. We may arrive at our results by slow and devious methods, but at least they are results that endure, and some of them will be treasured by future generations.

Web Rotary Offset Printing.

Now that offset has achieved almost everything that seems to be possible for it on sheet-fed machines, and has been speeded up to the utmost by means of automatic feeders, attention has been directed to the possibilities of web rotary offset printing, because it is felt that if ever offset is to be applied to newspaper and periodical production it must attain a speed approaching, if not equalling, the speeds of present-day rotary letterpress machines printing from stereo plates. Several machines have been built, but so far makers are uncertain as to the possible output. About 6,000 to 8,000 perfected sheets per hour seems to be the accepted practicable speed at the present time, though 10,000 has been attained in occasional spurts. Some think that 15,000 may be reached, but that has yet to be proved, and newspaper proprietors will want a lot of convincing yet before they begin to supersede their present plant. Personally, I have no great faith in offset printing ever being made practicable in the hurry-scurry conditions of a modern daily newspaper, or even those of a weekly of large circulation, but it may suit provincial weeklies of moderate circulation, and with plenty of time for production. It may also serve very well for cheap magazine work.

One drawback of offset for newspaper work is the uncertainty of the life and clean continuous working of the plate. There are all sorts of influences calculated to cause deterioration during the run. However, we must not say positively that "it can't be done." New methods, such as dry litho, or wharf litho, or aquatone, may help, or it may be that the idea of etching offset plates in intaglio—that is to say, sinking the image below the surface—will prove the solution of the problem of securing a more durable plate.

Prospective Developments in Multi-Colour Printing.

In the near future we shall undoubtedly see some great developments in colour printing. In America the Claybourn processes and machinery are making great progress. The system deals with letterpress blocks, and aims at securing better register and printing quality by press improvements. One of their recent introductions is a proving press with four plate beds arranged one after the other, each with a separate inking mechanism; the sheet to be printed being fed into the grippers of a cylinder which travels over all the plate beds in succession, retaining the sheet until it has received the impression of all the colours. Such an arrangement may provide good register and perfect inking, but the problem of printing one colour over the other whilst still wet will have to be solved. As, however, the purpose of this proving press is to pull proofs of plates which have to be subsequently printed on multi-colour rotary presses, the wet proofing is no detriment, as it shows what will be the result of wet printing on the machine.

Multi-colour proofing and printing presses for letterpress should teach a great deal to the offset printer, as also will the multi-colour presses which are being made for rotary colour photogravure. In Germany there are three such presses in course of being tried out. They are designed to print four colours in succession from copper cylinders, and the speed expected is about 4,000 finished copies per hour. The difficulty so far has been to get good register.

One advantage which rotary photogravure possesses over letterpress and offset is that the drying of the ink can be speeded up to the required degree, so that no artificial drying or slip-sheeting is required. Very good colour work is being done on sheet-fed photogravure machines with automatic feeders, and it is found that three or four machines can be run alongside each other so that the product of one machine can be passed on to the neighbouring machine. In this way a speed of 2,500 per hour can be obtained, with an average of 2,000 per hour on the day's run, so that by having three or four machines running simultaneously the output is practically 2,000 finished three- or four-colour prints per hour, and 20,000 per day is usually attained in the establishment I have in mind. It might be worth the consideration of offset printers whether such a system could be adapted for their work, if it is not done already.

The Future.

One can hardly predict what the future is going to bring forth as new processes and new machinery are developed. Printing methods are so interdependent that improvements in one branch will stimulate and suggest improvements in another. Blockmakers and letterpress printers need not regard with jealousy the advances of offset and photogravure. They are going to learn a great deal from the developments of these processes, and if they take the lessons to heart and strive to improve their own methods, it may be years before the older processes are superseded by the new ones, if they ever are. Printing offers such a wide field of useful applications and employment that there is no doubt plenty of room for everybody and for all processes, no matter what mechanical appliances may be brought in.

All who are associated with printing ought to feel proud of the marvellous progress of the craft in recent years. In that progress the photo-mechanical processes which I have sought to explain have played a very great part, and they are destined to play a still more important part in the not very distant future.

"Liverpool Post & Echo" Pensions

The directors of the Liverpool Daily Post and Echo, Ltd., have decided, after careful consideration, to put into operation, as from January 1st, a pension scheme for their staffs. The scheme will be non-contributory, and the management reserve to themselves the right to treat every case on its merits, and to vary the scheme at any time, particularly in the event of any Government or similar scheme coming into operation. The pensionable age is 65 years, at which the question of retirement automatically arises for consideration.

The qualifying period for the full scale of pension is 30 years of uninterrupted service. For any period of service in excess of 15 years, however, a member will be considered for a pension on a *pro rata* basis—that is to say, he or she may receive, at the age of 65, a pension rising proportionately in amount for every completed year of continuous service from 16 to 30 years. A maximum pension will be fixed in the case of those in receipt of the higher salaries.

Printing, Bookbinding & Kindred TRADES OVERSEERS' ASSOCIATION.

The New Year was marked by a large gathering of the members at the monthly meeting of this Association on Tuesday last week, at St. Bride Institute, Bride-lane, E.C.4. The chair was occupied by Mr. J. Fleming (president), supported by Mr. A. C. Ware (vice-president). An important item appearing on the agenda for the evening was the question of unemployment benefit, regarding which there is involved the alteration of one of the Association's rules. At the conclusion of the routine business an interesting lecture was given by Mr. A. J. Daines, a past president, entitled the "Humour and Pathos in Ridgewell Cullum."

Before the proceedings commenced the president, on behalf of himself and the executive, extended to the members a wish for a happy and prosperous New Year.

The minutes having been approved, the correspondence submitted included letters from Mr. F. L. Williams and Mr. Geo. A. Eden. With reference to the latter gentlemen Messrs. F. E. T. Fox and A. G. Aves informed the meeting of visits paid to Mr. Eden since his accident. Though he had had the misfortune to have a nasty set-back, caused by slipping on the pavement, he was going on quite favourably.

The meeting then proceeded to the election to membership of Mr. Percy R. Hambrook, binding overseer, Messrs. Warrillows, Ltd., Birmingham.

The next item on the agenda was the appointment of an auditor for the annual audit, and Mr. F. E. T. Fox was formally selected for this purpose.

The rule relating to unemployed benefit was then discussed. This rule entitles every free member of not less than two years standing to a sum of 20s. per week for eight weeks, or not more than £12 in any twelve consecutive months.

In order to bring the provision for unemployment more within the scope of the finances of the Association the executive had recommended an amendment to the present rule, and this had been circulated amongst the members. The suggested amendment, which is to come before the annual general meeting next month for decision, entitles every free member of not less than two years standing to claim 30s. per week for not more than eight weeks, making a maximum of £12; a free member of eight years 30s. per week for eight weeks, and further benefits of 20s. per week, with a maximum of £20; a free member of twelve years 30s. per week for twelve weeks, and further benefits of 20s. per week for twelve weeks, making a maximum amount of £30. Other points in the suggested amendment include a provision whereby a member who has exhausted his full unemployment benefit of £30 shall have the privilege of applying annually to the executive to have his subscription paid from the Benevolent Fund if unemployed.

Mr. Chris Atkins proposed that the recommendations put forward by the executive be dealt with according to rule at the annual general meeting, and in doing so expressed his opinion that the proposals were quite generous, and, as far as he was able to judge, were adequate.

The proposition was seconded by Mr. G. J. Hellery and carried.

Mr. J. Southey made a suggestion that the Association might consider the question of increasing the members' annual contribution by 4s., an amount which would automatically throw £40 a year into the unemployment fund.

Several speakers were averse to adopting a wider policy of unemployed benefits, principally because of the comparative smallness of the Association. It was their opinion that the Association should retain as its chief objects, those of a social nature.

Mr. Daines, whose interesting talks on literary subjects are always appreciated by the members, then dealt with some of the books of Ridgewell Cullum. Taking some of the leading characters of this celebrated and fascinating Canadian author Mr. Daines went on to explain how the writer was able to portray the deepest incidents in life as well as to lift his readers to the highest sense of humour.

Messrs. Cox, Esler and Fox having expressed thanks to Mr. Daines, a vote of thanks was further moved by the chairman, who tendered to Mr. Daines the praise of the meeting for his illuminating lecture.

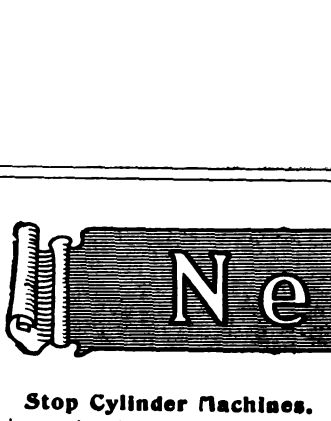
New Inventions

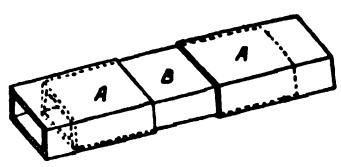
Stop Cylinder Machines.



In an invention by the Schnellpressenfabrik Frankenthel Albert et Cie Akt. Ges. a stop-cylinder printing machine is fitted with two sets of grippers *d*, *f*, the set *f* serving to hold the sheet to be printed to the impression surface *a* while the sheet is being printed by the forme *c*. The grippers *d* receive the sheet from a feed-board while the cylinder is stationary, and as the forme *c* moves to the

right for the printing operation, the grippers *d* carry the sheet to a transfer cylinder *b* which carries the sheet round for one revolution, and transfers the unprinted sheet to the grippers *f* while the printed sheet is delivered printed face upwards from the top of the cylinder by means of strippers *h* and delivery rollers *i*, *k*. The inking apparatus is arranged under the feed board.

Printers' Composing Sticks.



In an invention patented by Mr. P. Simpson the edge of the base-plate *a*, Fig. 1, of a composing stick, which is remote from the back flange *m*, is folded under the plate and is provided with notches *c*, Fig. 2, which are engaged by a toothed extension *g*, Fig. 3, on the head of

a bolt *e*, which slides in the cross-member *d* of the knee or slide of the stick. The bolt is pressed by a spring *h* into engagement with the notches *c*, and can be released by pressure on the head *f* of the bolt. The knee or slide is held against the back flange *m* by a clamp *n* provided with a set-screw *p*.

Extendable Printers' Furniture.

A novelty in printers' furniture is patented by Messrs. C. C. Whitling and W. A. Gitsham. By their invention extendable furniture is

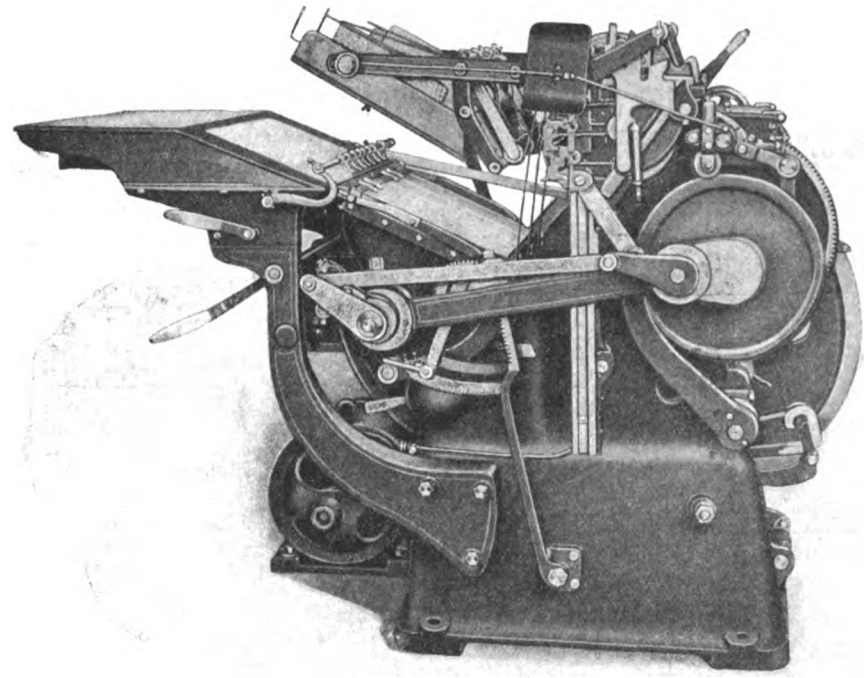
composed of rectangular tubular members A, B, sliding one within the other, the outer members A being of standard point dimensions both externally and internally. Leads or U-shaped saddle-pieces are inserted between the members A to hold the furniture extended.

Strengthening Esparto Paper.

A recent patent aims at the production of a strong esparto pulp suitable for use instead of bleached sulphite pulp.

The process consists essentially in cooking the grass at, or slightly below, 100 deg. C., without pressure, in a fairly strong solution containing caustic soda and sufficient organic matter to restrain the action of the alkali on the esparto. Cooking is discontinued when the material is nearly, but not completely, disincrusted, and the pulp is given a thorough washing. In this condition it may be stored for any length of time, and before using it is treated with a hot alkaline solution, preferably of soda ash, the treatment being such that the subsequent bleaching can be effected with 10 per cent. bleaching powder.

For example, the esparto is cooked by boiling at atmospheric pressure for five to seven hours with about 10 to 12 per cent. of caustic soda on the weight of the grass, in the form of a 10 to 15 deg. Baume solution of organosodic compounds. The subsequent alkaline treatment consists in boiling for about two hours with 1 to 3 per cent. of soda ash on the original weight of grass taken; and after complete elimination of the soda the pulp is bleached with 10 per cent. of bleaching powder.



The resultant pulp is not hydrolyzed and has a high felting power, which makes it suitable for use instead of sulphite in the furnish of printing papers.

THE PAPER-BOX TRADE.—The Minister of Labour has issued a notice of intention to make a special Order altering, for purposes of the Trade Boards Acts, 1909 and 1918, the description of the paper-box trade contained in paragraph 2 of the Schedule to the Trade Boards Act, 1909. Copies of the notice and draft Special Order and Information as to the intended scope of the latter can be obtained on application to the Secretary, Ministry of Labour, Montagu House, Whitehall, S.W.1.

THE PATENT

"MONOPOL" SAFETY PLATEN

is the FASTEST and MOST UP-TO-DATE hand-fed art platen press on the market.

Built in 3 Sizes: $9\frac{1}{2}$" × 13" $12\frac{5}{8}$" × $17\frac{3}{4}$" $16\frac{1}{2}$" × $21\frac{5}{8}$"

SPEED RANGE: 2,000 TO 3,500 IMPRESSIONS PER HOUR!

Will successfully tackle 95 per cent. of your platen work, including the finest Register Colour Work, affording a handsome profit on everything it does.

Camless drive of roller carriage ensuring perfectly smooth motion even at top speed.

Inking Apparatus of the latest cylinder type. The forme is supplied with fresh ink both during the downward and upward movement of the roller carriage.

The impression is automatically thrown off in case of a misfeed.

The sheets are fed by hand to front gauges on a sloping feed board, in a similar way as on a cylinder machine.

PRINTED SIDE UP DELIVERY, each sheet being in full view of the operator.

The delivery device can be raised out of position in a few seconds to allow for easy access to the platen.

Write to-day for full particulars to the Sole Agents:

Progress Series.—No. 1.—This is the first of a series showing seventy-six years of progress in the manufacture of printing inks, rollers, sundries and specialties (Litho and Letterpress) by the House of Winstone

This advertisement will be followed by others featuring Enterprise, Evolution, Stability, Achievement and Service.

THE ability to visualise and interpret the needs of to-morrow has lifted small enterprises to industries, kingdoms to empires. It has produced inventions; built factories: created markets: extended commerce. It has made the luxuries of yesteryear the necessities of to-day.

When Benjamin Winstone started making printing inks in the little Wine Office Court laboratory way back in '48—seventy-six years ago—printing had little economic value: it was not the vital adjunct to sales as the modern business man knows it. But Benjamin Winstone had Vision—faith in his craft. He saw a need, and built the whole structure of his organisation around meeting that need by supplying better and still better printing inks.

To-day the name "Winstone" on any product is the hall-mark of sound value and quality.

Letterpress Posters: A Few Ideas.

By ALFRED LANGLEY, President of the L.M.P.A.

"I must ask you to accept the few rambling notes I have made as just a few thoughts jotted down at odd times—in odd moments, and some in odd places—as I do not offer them to you as a treatise on, or a study of, poster printing in any sense" —said Mr. Alfred Langley (President of the London Master Printers' Association) in opening his address before the L.S.C. Jobbing Guild, at a meeting on Wednesday of last week, a general report of which meeting appears on another page. "I do not even venture," he added, "to give them as my convictions, as I really have not had time to reason with myself on the arguments I have endeavoured to express. I offer them to you for what they are—ideas that occurred to me at odd times, in an endeavour to find something that might be provocative of discussion, and lead to a more serious consideration of a subject which seems to have been sadly neglected, perhaps because it is not thought worthy of the serious consideration of the pundits of our profession." Mr. Langley then proceeded as follows:—

The standard of printing has been raised considerably in recent years, and the demand for better work is spreading throughout all glasses of advertisers. The knowledge of lettering and the discriminating taste shown by our customers to-day is no doubt due in a large measure to the influence of the advertising fraternity who have found their way in, owing to the neglect of printers to recognise the science of advertising and the varied potentialities of artistic printing as an advertising force.

Printers, for many years, kept their productions within the limits of what they could obtain ready-made from the material supply house, and, I fear, even to-day, would be limiting the artistic scope of their work to the same confines had the advertising agents not brought fresh views, divergent ideas and originality to bear in the preparation of advertisements. I venture to think that the printer has for too long overlooked the fact that he is primarily a medium for publicity. It is mainly because he has been too much engrossed with the details of printing to consider that what he was engaged in producing was intended to be an advertisement. Had the printer first considered the object for which the job was ordered, he would have acquired the advertising sense and have been the architect as well as the builder.

In letterpress poster printing there is a very large scope for the artist who has the advertising sense, and more scope than in many other departments of job printing. Here one can obtain broad effects with little effort.

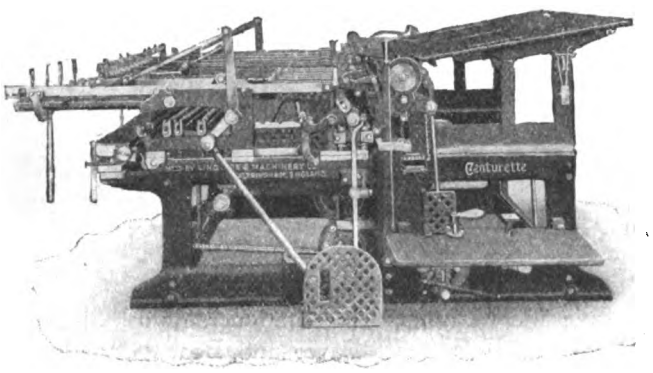
The aim of advertisers is to get a distinctive note in all their advertising, hence the demand for ideas from artists and for the individualist touch in every job. It is true that the letterpress printer is confined in his production to the type he has available, and is more or less in the same category as the maker of ready-made clothing. While the maker of ready-made clothing is restricted in his production to the particular patterns he has prepared, and is engaged more or less in repetition work, the printer is able to ring constant changes on his product with his particular stock patterns or movable types. Further, the printer is enabled by the flexibility of his patterns to give range to his abilities, and expression to any art that may be latent in him.

The Old Style and the New.

In poster printing, up to a few years ago, little regard was ever paid to the colour value of the various faces chosen, and the effect of the various styles or faces upon each other, these being used merely because they fitted the line produced. The main idea seemed to be that a full line should be followed by a catch-line, and that in turn should be followed by a three-quarter line, and so on indefinitely until the bill was completed. If the type indicated as most desirable to use failed to fill the line, then it was spaced, regardless of character and the proper proportion of white necessary, until it made a full line. The idea that the word "Concert," "Ball," or "Fête," being the object of the advertisement, could be printed to appear as the feature of the poster in anything short of a full line was quite out of the question. Can anyone say why? Compressed letters were cut in infinite variety to enable us to get long lines in massed formation—I presume for shock tactics, surely never for legibility!

The pendulum has taken its swing, and one is pleased to note that we are getting back to lettering that is not only graceful and beautiful, but far more legible. At the same time one must deplore the tendency of some schools to confuse eccentricity and the striving after originality with gracefulness and beauty. In striving after originality many of the modern school have rushed into chaos. It is an aftermath of the War, and a disease as malignant as Futurism, Jazz and Bolshevism.

The object of a poster is to give information. Its essential points are:—



1. It must give information in a manner that shall compel attention.
2. It must be legible at a distance commensurate with its size.
3. It must be suitable in style to the subject it advertises.
4. It must be attractive in its design, display and colour scheme, all of which must be in harmony with the subject-matter, in order to obtain the effect or create the impression it is desired to create in the mind of the reader.

Compelling Power and Legibility.

First of all, a poster, to be good advertising, must of necessity give information. A poster is intended to call the attention of the passer-by, or the man in the street, and should not be a puzzle or enigma for those with spare time to spend in solving it. It is not merely a certain amount of typesetting impressed upon paper and stuck up on the chance of meeting the eye of the passer-by. Puzzles, or acrobatic contortions in display for the mere excitement of curiosity, or novelty for novelty's sake, and all such abominations I shall endeavour to prove cannot be described as posters, if you accept what I venture to put forward as definitions. A poster should compel attention, but it does not follow that it should compel attention by any tricks of eccentricity. The compositor has no need to endeavour to make his forme emulate performing dogs. There is a compelling appeal in simplicity, and far more eloquence in truth and purity of style. No poster has more room or space upon the paper than is necessary to make the announcement required. It follows, then, that the potential readers whose attention is desired have no use for embellishments which are not a part of the appeal. This does not necessarily mean that embellishments that are suitable to the appeal, and, at the same time, in harmony with the scheme are taboo; but when one looks back upon the posters of the '80's and '90's with the so-called "ornaments" that were used to fill lines set in unsuitable types, one marvels at the patience of the long-suffering customer.

I come now to my second essential, that a poster should be legible at a distance commensurate with its size. Let me deal with the latter part of this assertion, "A distance commensurate with its size," because this brings me to a point which it is very necessary to stress, viz:—Salesmanship. A full knowledge of the customer's intentions is of vital necessity to successful salesmanship, and illustrates my oft-repeated assertion that it is not always good to let a customer have what he thinks he wants. A poster, like every other job, gets nearer perfection the nearer it fulfils the object

The Centurette, made by Linotype and Machinery Limited at Altrincham, Cheshire, is size for size the fastest Two-Revolution machine on the market.

It prints Double Demy at 3,000 per hour, and the quality of the work is above that usually obtained from a two-roller machine.

This result is obtained by the excellence of the engineering work put into this press.

Many Centurettes are in use for colour work.

It is made in two styles—(1) with printed-side-up delivery as illustrated above, or (2) with fly delivery.

Fuller details will be forwarded on application to

LINOTYPE & MACHINERY LTD.
9 KINGSWAY, LONDON

for which it is required, and secures the results that the customer desires. The printer should be the arbiter in a question of that kind.

Suitability of Style to Subject.

Now let me come to point 3. A poster should be suitable in style to the subject it advertises. This is where one has to tread very warily, as I am aware there are no two people with tastes identical, and to dogmatise on art is to ask for trouble and display ignorance. I do not propose to dogmatise on art, but we can find common ground on suitability and the recognised canons, although we have no recognised definitions of art, or at any rate none that we may be able to agree upon. How many posters do we see that are suitable in style to the subject they advertise? Are we going to deny that there is as much expression in the printed word and the method of its presentation to the public as there is in a picture? The artist expresses his feelings and temperament to the best of his ability, and if the picture portrays the feeling he sets out to express, we say he has put his soul upon the canvas—not only because he has painted the picture to satisfy the cravings of his soul, but because the finished product strikes within the one who views it a responding chord, or, in other words, he has made the appeal. Now it may seem absurd to compare the appeal of the painter with the work of a poster compositor. Personally, I do not think so. The messages left by the ancients which are to-day compelling attention by their delightful and graceful lines, have survived all clamourings of fashion throughout the long ages, and make their appeal because they bear the impress of the true artist, who got down to fundamental truth in advertising, the appeal to the finer instincts, the appeal to the love of beautiful things. Then, if a poster is to achieve its object, the type display must be in harmony with its subject, the type should convey the colour and atmosphere of the subject which it is advertising.

Let me instance a common illustration of what I mean. Take the auctioneer's poster, the double-crown, or double-demy bill that is frequently issued for the sale of furniture. Now assume that the auctioneer obtains instructions for the sale of "period" furniture. The differentiation in style of types used is frequently made by some houses who cater for that class of work. We have few "period" faces of types, but the standard classic, Caslon Old Face, has been successfully employed to create the atmosphere required, and does so by the association of ideas. The use of Caslon O.F. indicates the period of good furniture. This already accepted idea illustrates what I have endeavoured to convey to you, but the idea I desire to force home is that every job set by a printer should be set with the same idea of being suitable for the subject it advertises, and that we should stand or fall as an artist succeeds or fails, according to the measure of his appeal.

Attractiveness.

To be as attractive as possible, its design, display and colour scheme should all be in harmony with its subject-matter (my fourth condition), thus creating the right impression in the mind of the reader.

It stands to reason that if the poster does not create the right impression, or the im-

pression desired, upon the mind of the reader, it fails to attract the man for whom the appeal is intended, and it fails therefore in advertising value, which, after all, is the main object of its publication. To give information I placed as the first essential, but it must fail utterly if it fail to reach those by whom that information is desired, or those whom the publishers deem to be requiring that information. Further, it follows that an interest can only be awakened or created in the minds of those referred to by a poster that attracts or appeals, or that strikes a responding chord in the mind of the reader.

While it is possible to admire the colour notes and schemes of the 16-sheet posters issued to advertise the British Empire Exhibition, one could not by any possible means describe them as good advertising, and to my mind they failed as posters. A poster that is designed to attract twenty millions of people to a big show, needs to be one with a clear call to the man in the street. The hoarding is not the proper place for enigmas and puzzles, or philosophic paragraphs. These should be left to the leaflet or pamphlet that can be studied at leisure. The highest art, we are told, lies in concealing art, and there might have been a wealth of concealed art in the hieroglyphics and cryptic drawings at the head of those philosophic paragraphs, but I am quite sure that the few who might have had eyes to discern it and minds to absorb the letterpress would not have kept Wembley Exhibition open a few hours—and yet it was understood that many millions of visitors were required to avert a loss upon the undertaking. The lettering and execution was beautiful, but mere beauty is not sufficient if the poster fail to interest those whom it is designed to attract.

Now let us get down to earth, or rather to the cold composing surface—for no one is more conscious than I of the fact that words, mere words and pretensions of that much-abused subject, art, are of little value in the bulk of small jobbing houses where the bulk of the small job posters are produced. If you accept my view that a poster is not merely the covering of paper with a mass of lettering of various sizes and shapes, may I venture to give my idea of what goes to the making of a poster to meet the essentials which I have been venturesome enough to tabulate. Legibility is not only desirable for all the essentials detailed, but absolutely necessary. Spacing and white are indispensable to legibility, and play a most important part in all the essentials and definitions referred to. "Paper is part of the Picture," we are often told; and in no instance is the statement so true as in poster work. The paper that shows between the printing "gives each line view."

Types and Embellishments.

The choice of types is governed by the faces available in the office, and in many offices they appear to be very limited. In the poster department, as in the jobbing caseroom, families or series are desirable; and the choice of such series must necessarily be governed by the nature or subject of the work it is desired to cater for—or, at any rate, that which is cultivated. The employment of lower case is not only desirable but necessary. The judicious use of texts very occasionally lends a charm and fills a need in certain instances, provided their use is not in conflict with any of the essential points mentioned earlier. A mass of capitals, line after line, fails by the tests I have applied.

There is a place occasionally in the perfect poster for embellishment, and I do not despise the use of certain, what I term, "peculiar" sorts. I hold that, provided there is a place for them, they lend a piquancy and colour difficult to convey in any other way, and strengthen the necessary appeal. By peculiar sorts I mean the linked "O" where double-O appears, the long-tailed "Q," and certain paragraph marks, provided always they are suitable to the occasion and necessary to the picture. The rules concerning borders to posters are difficult to define, but the border should frame the job as picture, and not be employed for the sake of dragging in the resources of the composing room, or to give the artist the credit for having a nice taste in frames.

Colour in Letterpress Posters.

The question of colour in a poster comes under the axioms I have endeavoured to expound. It affects legibility, suitability, and more especially harmony with the poster's objective. How many colours should be employed, and what should be the position of those colours, or the position of the second colour, if only two be employed?

It is generally agreed, I think, that, for outstanding definition and visibility, black ink on orange or bright yellow paper comes first for sheer prominence, but it is quite obvious that the occasions for the employment of that combination must of necessity be very limited.

When we turn to the large number of letterpress posters that have, for many years prior to the War, been printed locally in this country for occasions such as fairs, agricultural shows, provincial town concerts, seaside pier pavilions, we find that at least two colours of ink, often three or four various colours, have been employed, with the idea of making an attractive bill. But do we find that the extra colours, beyond lending a kaleidoscope effect of variety, give any greater advertising power to the message the bill contains? I think not. I much doubt the value of coloured lines, as frequently introduced in many of the letterpress bills issued. Unless the second colour used be introduced with great care and discrimination, the extra cost of production is to a great extent wasted. There are many instances, however, where a touch of colour is of infinite value, and especially where it becomes part of the picture, and conveys that touch that is necessary to drive home the appeal or create an atmosphere that will excite interest in the particular subject advertised.

As an instance, I would again refer to the auctioneer's bill announcing the sale of a house, where text or black letter is introduced. If the bill be printed in black or brown ink, on white or toned paper, the text line giving the name of the house advertised, if printed in red, completes the scheme. But the poster that is produced with lines indiscriminately printed in alternate red and black (the red ink being introduced merely with the idea of giving emphasis) fails to perform what is desired as disastrously as the misuse of italics in large patches or the constantly recurring under-scoring in a woman's letter, fails to give emphasis, and leaves the reader cold to the appeal.

After all said and done, no ink is so visible and legible as good black ink, and the only use the second colour can serve is to throw up the effect of the black, and incidentally render the particular red line noticeable by its contrast, standing as it does in proximity to the upper and lower black lines. If the bill be mainly in black, a colour line should never appear at the top.

Many of my remarks, I am fully aware, apply to posters where there is a very large margin in the scope of discretion allowed to the printer, and perhaps the number of printers who get unlimited licence with a customer is very small. We know that the bulk of poster work that comes to the small jobbing offices is of a class that comes generally within prescribed categories. The double crown concert poster with the usual list of artists in addition to the place, object, date and particulars of where tickets can be obtained, is of this class. Admittedly, there does not seem much scope for originality or opportunity to evolve anything in the nature of a new lay-out. The same applies to the usual auctioneer's poster. Both kinds of posters seem to have traditional precedents which must be observed.

Be this as it may, I still hold that it is possible for the printer with imagination to conceive and produce posters with a new note in the scheme, and by gradual evolution reform the traditional errors until he creates a style of his own that will eventually mark his products as distinctive and place him safely out of the rut.

Choice of Type Faces.

The choice of types is one that needs care and discrimination. Opinions vary so considerably as to what the perfect letter should be. The last few years have brought about a complete revolution in taste. Advertisers generally have recognised the claims of the daintier faces, not only for their daintiness and air of refinement, but on the grounds of legibility and distinctiveness.

Seldom do we find that a letter, whether in metal jobbing founts or in poster type, looks equally well in all sizes. It is a peculiarity of most designs and series of founts that certain sizes seem to suit the character and convey the atmosphere of the original design, while many of the intervening sizes appear to lose their characteristics. This would seem to point to the fact that all lettering is originally cut and drawn in one size by the designer, the design being conceived with a certain definite size in mind. We know that enlargements and reductions in most designs affect their character. I have found that drawings made for line zinco work are frequently very unsatisfactory when reproduced in larger sizes, although the photography has produced a perfect-in-detail reproduction. This phenomenon is very marked in drawings where the white is unevenly distributed. The enlargement sometimes has the effect of enlarging the patches of white and condensing the masses of solids. Something of this kind may account for what I have mentioned in connection with lettering and account for the loss of character in certain sizes of types.

Like all typefounders' type, only more frequently, poster types need the correcting discrimination of the compositor in the way of letter-spacing. Little regard seems to be paid to the value of correct spacing of letters by typefounders or wood letter cutters; hence the compositor who would get the perfect effect must use his discretion as to the position of one letter relative to another, and adjust the distance by judicious spacing.

Posters as Salesmen.

Just a word on salesmanship. Many posters are spoiled at conception by attempting to make them do duty for a circular. The art of writing copy for a poster is one that needs careful consideration. It is a common failing of the customer to want to say too much in his announcement, and the mere fact that the compositor has been able to set up all the copy and get his typesetting into the prescribed space does not mean that a poster has been produced, nor does it follow that the production will achieve the objects desired by the customer. I am convinced that too many of us accept copy and take instructions as blindly and as meekly as children, and too few of us consider the effect of the implicit instructions we accept upon the advertising value of the finished production. The success of the job is going to be measured in the long run by its advertising value, and what we have to remember is that the customer is not often an advertising expert, whereas the printer should be.

Whether the customer appreciates the point or not, the success of a poster due to its value as an advertising medium is bound to become patent and bring more work to the printer eventually, whilst a bad production not only does harm to the reputation of the producer, but places a stigma on advertising generally, and discourages the use of such printing, to the detriment of the trade, as well as of the printer himself. The customer can only give us the copy of his message; it is up to the printer to revise and give his words the necessary inflexion and expression, in order that the message shall achieve the object the customer has in view.

In no part of our craft has so little advance or improvement been made as in the poster production of jobbing offices. Can we wonder that the demand for letterpress posters in the average jobbing offices is so small? The picture poster will always have a strong pull over the letterpress poster, but each has its sphere, and many more letterpress posters, involving more work for the jobbing printer, will be required than are produced now, if only the jobbing printer will realise that there is scope for any printed matter that achieves the main object of commercial concerns, namely, publicity. No greater power of publicity lies anywhere than in poster advertising. No cheaper means to convey a message to the public exists than in posters. The reason why advertisers and advertising men do not use letterpress posters and showcards to a larger extent, is because of the difficulty in getting the average jobbing printer to produce a poster that will make the appeal the advertiser wants to make.

The question of inks is one worthy of attention. "Poster ink" is a very vague

Digitized by Google

PRINTING OFFICES! AGENTS!!

A Great Business for Printers.

Results: Far More Profit and Bigger Sales without increasing your staff.

These advantages are offered to all Printing Offices by a new invention (Patents of which have been applied for in all countries).

A Machine which is not only designed for the production of up to 6,000 prints per hour in one and multi-colour work from the flat forme, Numbering, Length and Cross Cutting, Punching, Embossing and Re-winding, all in one operation, but will also produce the frequently needed **Jobbing Printing (also bigger sizes) much cheaper and with a much higher output than has been possible hitherto.**

It does not only work from the web, but prints with a far greater output —

Envelopes automatically; Sheets semi-automatically; or with a small apparatus attached, Sheets, also automatically.

According to a special procedure also patented prints produced by the machine can be improved in quality by an apparatus attached to the machine that same appear just like steel-die embossing in high relief.

Well-established Sole Agents are required to handle the sale of this machine, as well as of our Curveless Platen "Mirakel," which stands any competition; of important patented innovations in special machinery for special purposes such as Counter Checkbooks, Tickets, etc.; of half-rotary machines with excellent inking for the production of company shares, etc.; of Cutting Machines with the automatic equalizer of tension (DRP); of Offset Machines which signify a revolution in the ink distribution.

The best references for our machines are the repeat orders. Some of our customers have ordered up to 18 repeats after having tried the first machine.

Our machines are used in batteries in Government Imperial Printing Offices, as well as in many of the Best Firms in the World, from which we hold best references. For this reason they will easily be sold.

We are always ready to solve any problem which may arise in the printing trade and refer to our 100 International Patents which we have held for about 5 years.

Only recently we have solved a problem of which the solution seemed impossible to important firms of the trade—namely to print the title on ready printed and folded papers in rotary fashion from the pile, *e.g.*, illustrated, weekly or monthly papers published under different names.

J. HEINRICH SPOERL,

Special Machinery Works, DUSSELDORF.

P.O. BOX 863.

term. I can only say that in my opinion the "best" ink is just about good enough. In fact, this applies to all material.

The care of types in the poster room is too often sadly neglected. The proper cleansing, effecting the removal of all ink after use, is a factor in the life of wood type. The storage and racking, and prevention of bruising and batters, I need hardly emphasise. The idea prevalent years ago that any old jobbing founts and material that had served their time in the job department could be utilised in the poster room to advantage, has probably done as much to retard the advance in letterpress posters as anything.

I find I am wandering into a lecture on poster production, and this would be presumption on my part, as most of those present to-night know all and more than I can teach them; but, as I told you at the beginning, I desired to place a few thoughts before you that came to me in my endeavour to define a letterpress poster, a few notes made at random with the idea of provoking discussion in the hope that I may learn much that I do not know of a subject that has been sadly neglected by printers and those who furnish us with technical literature.

I have deliberately refrained from reading any articles or books on letterpress posters—first, because I wanted to commit my own ideas to paper, and obtain a jumping-off ground for arguing with myself later; and, secondly, because, as far as I know, there are none. There may be, I hope there are, and further, I hope that the subject may be one sufficiently alluring to induce someone more competent to devote a little consideration and time to it.

An Ancient Paper Mill.

Restoration of West Mills, Newbury, now owned by Hovis, Ltd., has drawn attention to their interesting history. They have been used for other purposes besides that of papermaking. There is a reference to West Mills as early as 1200, and apparently they were then engaged in fulling operations.

Paper was made at these mills in the latter part of the 18th century, particularly by the Wickwar family, who also worked the Bagnor Mills, famous in their day, and who gave their name to a special make of paper. In the Agricultural Report of 1813, by Dr. Mayor, mention is made of papermaking on a large scale at West Mills, and the product is spoken of as "excellent and applicable for printing and writing." Up to 1817-24 these mills were still used for making paper, being then occupied by William and John East, who were succeeded by a John Higgs. The mills subsequently came into the possession of the Fuller family, being afterwards acquired by Mr. George Knight, by whom they were sold to Mr. John Kingham, of whom the late Mr. George Wallis purchased them some 46 years ago. Then in December, 1920, they were acquired by the firm of Hovis, Ltd. It is probable that only within the last 80 years have they been exclusively used for grinding corn, as old residents of a former generation recollect when the three processes of fulling, papermaking and flour production were proceeding under the same roof.

The Printing Art.

An Illustrated Monthly Magazine for Business Men who Buy Printing and for the Printer who Sells it.

Trade Notes.

PARTNERSHIPS dissolved announced during the week include those between H.C.Shepherd, L. A. Shepherd, and W. Farley, printers and stationers, Maiden-road, Romford-road, Essex, under the style of Geo. E. Elwood, so far as regards H. C. Shepherd; H. A. Coombs, H. N. Coombs, A. C. Coombs, and A. R. Coombs, stationers and manufacturers of carded goods, 10, Farringdon-avenue, London, under the style of H. A. Coombs, so far as regards H. A. Coombs.

THE library of 15,000 volumes and the high-class stock-in-trade of stationery and fittings at the Beresford Library, St. Helier, Jersey, were disposed of by auction last week, by order of the liquidators. The printing business had previously been disposed of to Mr. J. T. Bigwood, Broad-street, St. Helier.

MESSRS. E. J. BURROW AND CO., LTD., printers and publishers, of Cheltenham and London, this month celebrate their 25th birthday. The business was founded in 1900 by Mr. E. J. Burrow, F.R.G.S., who is the present managing director. At a dinner in honour of the event, Lord Montagu, chairman of the company, presented Mr. Burrow with a bronze portrait plaque of himself, subscribed for by the directors and staff.

THE action for libel begun last July by the proprietors of Yadil against the *Daily Mail*, Sir William Pope, and Professor Dixon has been dismissed in the High Court of Justice, with costs against the proprietors of Yadil.

FEBRUARY 3RD has been arranged as the date when the Postmaster General will receive the Joint Industrial Council's deputation on the subject of postal rates.

THE London District Committee of the Joint Industrial Council is to meet on Tuesday next to appoint a local joint committee as examining board under the J.I.C. Apprenticeship Scheme, to arrange for a series of lectures during the spring on lines similar to those of last year, and to consider a dispute which has arisen between the London Master Printers' Association and one of the trade unions on the question of demarcation.

THERE will be a meeting of the Irish Master Printers' Association in Dublin on February 3rd.

A NUMBER of firms in the printing, paper and allied trades are among those contributing to the fund for the preservation of St. Paul's Cathedral, London. An interesting item in the list of contributions is a donation of 50 guineas by the Council of the London Master Printers' Asssociation.

PERFORMANCES of "The Pirates of Penzance" have been given by *The Times* Musical and Dramatic Society at the Guildhall School of Music in aid of *The Times* Auxiliary to the Printers' Pension Corporation.

ON Saturday evening a dinner was held in London to celebrate the handing over of £1,000, as a result of the November Appeal, to the Greater London Fund for the Blind. Mr. W. Fletcher (Linotype and Machinery Limited) presided. Captain Towse, V.C., was the guest of the evening. During the two years and a half of its existence the Printing and Kindred Trades Blind Aid Committee has handed over the sum of £2,960 in aid of the civilian blind.

AN excellent musical programme has been arranged for the bohemian concert of the Lithographers' Auxiliary to be held at the Cannon-street Hotel to-morrow (Friday) evening. Amongst the artistes appearing on the programme is Mr. Charles Coborn, who is described as the veteran of veterans.

THE first review to be published in the Scilly Islands makes its appearance this month. It will be a quarterly journal and will contain island news, in addition to articles, etc. Mr. Geoffrey Fyson, the poet, will be one of the joint editors of the new journal, the *Scillonian*.

BY the bursting of a carboy of nitric acid on the premises of an engraver at Newcastle on Tuesday, Mr. H. Thew and David Gemmell, an apprentice, were seriously burned. The mishap was followed by an outbreak of fire, which was extinguished by the employment of chemicals.

SIR THOMAS JEWELL BENNETT, C.I.E., chief proprietor and for many years editor of the *Times of India*, Bombay, died on Friday from heart failure at his residence, 38, Hans place, S.W., at the age of 72. His earlier career was associated with the English provincial and London Press. In 1884 he went to the *Bombay Gazette* as associate editor, and in 1892, at the death of his friend, Mr. Henry Curwen, editor of the *Times of India*, he found himself nominated to the editorship and principal proprietorship. Under his management the *Times of India* greatly enhanced its status, and the printing business, now an important adjunct of the newspaper, was built up.

MR. SAMUEL STOREY, of Sunderland, the well-known North of England newspaper proprietor, died last week just after having celebrated his 85th birthday.

THE death occurred last week, at Hastings, in his 71st year, of Mr. Harry Furniss, the well-known caricaturist, author and lecturer. He is best known by his work as a cartoonist in the pages of *Punch*, which journal he joined in 1880 at the age of 19.

THE death occurred on Monday night of Mr. Francis E. H. J. Barrett, music critic of the *Morning Post* since 1890.

THE *Schoolmaster*, official organ of the National Union of Teachers, is to add the title *Women Teachers' Chronicle*.

THE exhibition of international posters at the Whitechapel Art Gallery was so much appreciated and so well attended that the trustees have decided to continue it from January 20th to February 28th. It will be open daily, free of charge, from noon to 9 p.m. (Sundays 2 to 9 p.m.), and illustrated lantern lectures will be given on Tuesdays at 4.30 and 7 p.m.

IN view of the growing public interest in the art of modern posters the London Midland and Scottish Railway have decided to lend to municipalities, on application, the originals of their famous series by Royal Academicians. Some of these originals, with specimens of colour printing illustrating the several stages in reproduction, have been already shown at Plymouth, and the Art Galleries of Cheltenham and Oldham are to have them for exhibitions beginning on February 16th and April 15th respectively.

A PAPER ACTION. — Before His Honour, Judge Spencer Hogg, at the Bury County Court on Jan. 12th, Frederick Simpson (Manchester), Ltd., papermakers' agents and merchants, Corporation - street, Manchester, claimed from Tom Rushton, general theatrical agent and manager, Parkhills-road, Bury, £100. Fredk. Simpson said he made a contract with the defendant in September, 1924, to buy 15 bales of white wove paper at £10 10s. per ton, and another contract on October 1st for another three bales. The defendant had not delivered and he had to buy at £24 10s. per ton. It was election time and people were pressing. The difference amounted to £101 10s. and he abandoned the odd £1 10s.— His Honour gave judgment for £100 and costs.

Personal.

VISCOUNT BURNHAM presided at a smoking concert at the London Press Club on Saturday night, on behalf of the Newspaper Press Fund.

THE Prime Minister has accepted an invitation to lunch at the Press Club to-day (Thursday) when the other guests will include the French Ambassador, the Chancellor of the Exchequer (Mr. Winston Churchill, M.P., who is an honorary member of the club), and the Secretary for India (the Earl of Birkenhead).

AT a meeting of the Court of Lieutenancy of the City of London, held at the Guildhall on Monday, those re-elected included Alderman Sir J. J. Baddeley and Mr. A. J. Waterlow.

SIR HENRY DUKE, who was created a Peer in the New Year Honours List, will take the title of Lord Merrivale.

MR. W. HOWARD HAZELL, speaking last week at a luncheon of the Labour Co-Partnership Association at Pinoli's Restaurant, explained the scheme of co-partnership which existed in the business of his firm, Messrs. Hazell, Watson and Viney.

MR. W. M. BOWERS, of Linotype and Machinery Limited, delivered an illustrated lecture on "Modern Linotypes" at Armstrong College, on Monday, under the auspices of the Newcastle District Committee of the Printing and Allied Trades Joint Industrial Council.

MR. A. CHADWELL and Mr. W. Bullett were again re-elected president and secretary respectively of the Electrotypers', Stereotypers, Managers and Overseers Association at its annual meeting on Tuesday at St. Bride Institute.

MR. J. S. SUNDERLAND, electrotyping instructor at the London Printing School, is to give a lecture at Cambridge on January 30th dealing with modern improvements in electrotyping and stereotyping machinery.

MR. FRANK COLEBROOK gave an address in the main hall of the Royal Albert Institute, Windsor, on the 13th inst., upon the life and work of Charles Knight, of *Penny Magazine* fame, the pioneer in educative and entertaining popular literature.

MR. STANLEY OXLEY, proprietor of the *Windsor and Eton Express* (which paper Charles Knight founded in 1811), presided at this gathering. Mr. Colebrook showed Knight's folio Shakespeare with its magnificent engravings. This, with some other specimens, was lent by Messrs Chas. Knight and Co. St. Bride Institute also lent some Knight publications.

MR. A. H MANN, the editor of the *Yorkshire Post*, was on Saturday evening the principal guest at the annual dinner of the Society of Yorkshiremen in South Wales. The other guests included Sir William Davies, editor of the *Western Mail*, and Sir John Duncan, of the *South Wales News*.

MR. JAMES TURNBULL, a member of the composing-room staff of the *Yorkshire Post*, and the son of a former overseer of that paper, has retired after more than 40 years' service.

MR. F. R. HUXTABLE, of the *Yorkshire Post*, Leeds, has been co-opted on the council of the Newspaper Press Fund to fill the vacancy caused by the resignation of Mr. W. H. Scott, Leeds.

MR. J. R. FIRTH, governing director of Messrs. P. J. Firth, Ltd., of Australia, is paying an extensive visit to Europe and America this year. He will be accompanied by his wife and daughter and three sons. The party expects to be in Germany and Holland during March, in England during April and May, Scandinavia in June and July, returning *via* the United States during August and September.

MR. FIRTH, in addition to being governing director of a firm which has its headquarters at Sydney and branches in Newcastle, Brisbane, Melbourne and Adelaide, is also chairman of the Sydney Cardboard Box Manufacturers Association and the Sydney Wrapping Paper Association.

MR. PERCY W. KENNETT, on leaving the directorate of Messrs. Spicers, Ltd., to go into partnership with Messrs. Herring, Dewick and Cripps, has been the recipient of a chorus of congratulations, not only from his fellow directors and collegues at Blackfriars House, but from hosts of friends in the paper trade.

FEW men are held in higher regard, alike for personal qualities and for business probity. His election as president of the Stationers' Social Society in 1921 was suggested by his high standing in the trade.

IN addition to the luncheon and presentation given to him on Jan. 13 by his fellow directors of Spicers, Ltd, a report of which appears in another part of this issue, Mr. Kennett received on Jan. 14 a personal gift from his colleagues on the board in the shape of a silver cigarette box, bearing the following inscription: "Presented to Percy Walker Kennett with best wishes of his fellow directors at Spicers, Ltd., 14th January, 1925."

THE staff of Spicers, Ltd., were also anxious to mark their esteem for Mr. Kennett and accordingly they entertained him to dinner and made a presentation on their own account on Monday night at the Bridge House Hotel, London Bridge.

Printing and Allied Trades Charity
SPORTS ASSOCIATION.

Annual Committee Dinner.

The annual dinner of this old-established sports association was held at the Manchester Hotel, London, on Saturday last, a record attendance compelling the stewards to divide the diners into two parties. After dinner the whole company assembled together to enjoy an exceptionally fine concert programme, under the direction of Mr. T. Wheeler, of the B.S.C. Fund.

Mr. A E. Holmes (secretary of the Printing and Kindred Trades Federation), as the president of the swimming section, made an ideal chairman, and a very pleasant evening was spent by the whole company.

Mr. Holmes, in proposing the toast of "The Charity Sports Association," traced its history from its inception to the present day. The first balance sheet of the sports held at the Tee-To-Tum Grounds on June 11th, 1898, showed a balance of £41 2s., whilst that of 1921, showed a balance of £2,194 8s. 1d., thanks to the special efforts of Mr. Chas. H. Roud. The chairman recalled with pleasure his association with the committee, dating back to 1901, and went on humorously to describe the winning of a rowing race a few years later at the Welsh Harp, Hendon. The splendid gathering here assembled proved how strong the social element prevailed, and it was encouraging to note that the last two chairmen of this annual function were present in the personages of Mr. Chas. H. Roud and Mr. A. H. Mundey, both of whom were thorough sportsmen. He was very sorry to announce that the Boxing Club had decided to sever their connection with the parent body. The club numbered over 100 members, and was highly successful under the direction of Mr. Charles Anderson, the hon. secretary. On behalf of the Charity Sports Committee, he wished the club continued prosperity and success. There had been some talk in official quarters of providing cups and trophies for national competitions amongst the employees of the printing and kindred trades. It was calculated that this would bring about increased goodwill between employee and employer in the provinces as well as in the metropolis. There was no reason why even boxing competitions should be confined to London. There was no doubt that Londoners led the van of progression in social functions, sport, and in charitable efforts. He felt sure that if competitions could be started on these lines it would be to the ultimate good of all concerned. He trusted that Mr. Parker would consider the matter, when he would find others ready to push the scheme forward. It was interesting to know that Mr. H. F. Parker and Mr. W. A Fricker were the first hon. secretaries of the Association, and he wished them health to continue the good work for many years to come. They were specially pleased to see their hon. secretary, Mr. H. F. Parker, again looking his old self after the serious illness he had recently passed through. They were also glad to have the company of Mrs. Parker. Mr. Holmes concluded by coupling the name of Mr. H. F. Parker with the toast.

Mr. H. F. Parker, in thanking the chairman for his kind allusion to his health, said that he was glad that the committee's efforts had again proved successful this year, for although they had not yet disbursed their surplus, no less a sum than £182 6s. 6d. had already been distributed amongst the trade charities. Mr. Parker reviewed the past work of the committee and was sanguine enough to believe that still more prosperous times were ahead. He welcomed the idea of national competitions, and felt sure that many present would assist in the effort, especially Mr. Woodgate Stevens, Mr. Geo. Larcey, Mr. Harry Chalk, Mr. Fred Knight, and last, but not least, their good friend Mr. Arthur O'Connor. Mr. Parker further said that no one could look back to the days when they held their sports at the Crystal Palace without having very pleasant memories. It was this social element that had been the success of the Association, for it created an interest in the work on the part of wives and sweethearts, and their presence that night was proof of the statement. In conclusion, Mr. Parker thanked the company for the way in which they had received the toast, and said he trusted that when they met again next year they would be able to give even a better statement.

Mr. A. H. Mundey, who also responded, said that his chief, Mr. John Fry, together with his esteemed wife, took a real interest in the work of the Association, and only illness prevented them from being present that evening. Personally he was a great believer in sport, because it kept a man fit and well. Now that ladies took such prominent positions in municipal and public life, he trusted that they would devote more attention to encouraging athletics for women. He appealed to the ladies present to excuse their husbands keeping late hours, as he could assure them that the men were doing a noble work that some day might be beneficial even to themselves. Personally, he should continue his interest in the Association, as also would his friend Mr. Geo. Marks. They had just heard that the best football match of the year would be held at the Nunhead Football Grounds on Easter Monday. The match was between the picked men from the Paper Workers and the Natsopa Unions, and he would strongly advise everyone to patronise the match.

At 9 p.m. the harmony was stopped to drink the health of "The Boys of the Paxton Lodge," many of whom would have been present had it not been for that function. A similar toast was proposed to "Our Absent Friends."

Mr. Chas. H. Roud, always an entertaining speaker, made a point in his toast of "The Visitors" by complimenting the ladies for gracing the company by being present. It gave them an opportunity of seeing what sort of company their husbands kept, and would, he hoped, enable them to be gracious to their husbands when returning from a committee meeting. He coupled with the toast the name of Mr. T. Jolly, associating with it the names of Mr. Fred Brown and Mr. Tom Cook, two old members of the committee now retired from the ranks of labour.

Mr. T. Jolly in responding on behalf of the visitors said it was a pleasure for him to be again amongst them for the second year in succession. He recognised in Mr. A. E. Holmes an old shopmate and an old competitor in a rowing club. It made him feel that he was no stranger in their midst. He felt sure that such gatherings did a great deal of good, as they brought employer and employee together under the best possible conditions. As an employer he could testify to the value of sport in their particular line of business. It counteracted the sedentary state of their occupation and supplied a healthy pursuit in spare time. On behalf of Mr. Fred Brown, Mr. Tom Cook and the other visitors, he thanked the company for the way they had received the toast.

Mr. J. L. Scorgie, in proposing the health of "The Chairman," said that he felt it an honour to be permitted to ask them to toast a man so specially worthy of their esteem. He had known Mr. Holmes for over a quarter-of-a-century, and during the whole of that period Mr. Holmes had proved himself a staunch trade unionist and a good sportsman. He had won laurels in both domains, and it was with the utmost pleasure that he asked them to be upstanding and toast the health of the chairman.

Mr. T. A. Newnham, in seconding the toast, said that he too had had the pleasure of Mr. Holmes' acquaintance for something over 25 years. He was afraid that he could not add much to what had already been said, but he could certainly endorse Mr. Scorgie's remarks.

Mr. W. H. Marshall officiated as toastmaster, a duty for which he is specially qualified.

The dinner stewards, Messrs. W. J. Allan, G. W. Knight, W. H. Marshall and F. C. Peacock are to be congratulated on the great success attending their efforts.

Printers' Medical Aid Pension Fund.

The Committee of this Fund organised a most successful dance at Lever House, Blackfriars, on Monday last, and it was exceedingly well attended. The P.M.A. Pension Committee are to be congratulated on the progress made, as it was only in 1920 that it first conceived of forming pensions as a side line to the excellent work of the Printers' Medical Aid, and the next election paper will show that in that small space of time two pensions of £20 each have been launched. At the dance on Monday Mr. Jimme Gardner's Gleniffer Dance Band kept the dancers well on the move, and gave infinite enjoyment. The M.C.'s were Mr. W. F. Moore and Mr. J. Powell, to whose indefatigable efforts the success of the whole affair is due.

It is interesting to note that the second P.M.A. Pension which the funds of this dance assisted will be named the E. J. Flowerday Pension.

Calendars, etc., Received.

MESSRS. THOMAS DE LA RUE AND CO., LTD., the well-known London printers, whose specialities include the printing of bonds, postage stamps, bank notes, etc., exemplify in their calendar for 1925 some of the intricate and artistic work which security printing involves.

THE PRINTING TRADES' ALLIANCE has issued a monthly tear-off calendar having the wording and dates in blue with ruling in red.

THE serviceable calendar of Messrs. W. S. Muir and Co., Ltd., is happily interleaved with samples of pure vegetable parchment, superfine bleached greaseproof and tracing papers These are specimens of the products of the well-known Neusser mill. The quality, of course, is uniformly good and the variety in substance, design and tint is most intriguing.

WE are indebted to Messrs. L. S. Dixon and Co., Ltd., paper merchants of Liverpool and London, for two useful calendars. One is a large quarto card, with the year's dates clearly set out within an ornamental red border. The reverse side specifies the wide range of papers, boards, etc., handled by the company, together with a table showing the comparison of substances of paper. The smaller calendar gives postal and other information in a handy form.

THE Kellner-Partington Paper Pulp Co., Ltd., Manchester and London, have issued a desk calendar printed on Borregaard bank. There is space for a week's engagements on each sheet, which also contains the month's dates. Postal information and the complete 1925 calendar are printed on the back of the pad. Borregaard bank takes ink and pencil well.

A CALENDAR with the compliments of P. Garnett and Son, Ltd , Otley, has the monthly date pad clearly printed on the firm's snow-white poster paper. The stout and effective card advises those whom it may concern to support home industries, and "Get it made at Garnett's, makers of duplex papers and boards." Particulars of the various grades made on the three machines (two 94 in. and one 84 in.) are set out in detail, with the names of the agents—Messrs. Harold Spalding and Co. (London), E. Barlow and Co. (Manchester), R. Bruce and Son (Glasgow), and F. Doherty and Son (Dublin).

A LARGE and striking calendar reaches us from Messrs. Smith, Stone and Knight. It is elaborately designed. An open book shows illustrations of the Union Paper Mills where browns, caps and sugar papers are made and the Birmingham Paper Mills, whose products are all kinds of paper bags and corrugated boxes. The date pad is neatly attached at the bottom of the card, which measures 18 in. by 13¼ in.

A CLEAR and useful calendar is that of Messrs. James Green and Co., Ltd., paper merchants and wholesale stationers of Kingsway House, London. The letterpress is appropriately and beautifully printed in green ink, while the monthly dates are in red and black, a tasteful contrast which allows the figures to stand out prominently.

THE 1925 calendar sent out by Messrs. J. and W. Mitchell, Ltd., Bordesley Paper Works, Birmingham, comprises samples of the firm's products—mounting boards, pasteboards, and various papers such as embossed enamel, chromo, poster, tinfoil, aluminium, calf, surface-coloured, etc.

"THE Paper Trade Directory of Great Britain, India and the Colonies" reaches its 39th year of issue with the 1925 edition. In addition to the particulars concerning paper mills and watermarks, it contains the Paper Trade Customs, information concerning trade associations, equivalent weights and sizes and a diary for the year. The book is of handy dimensions and is priced at 3s. net.

THE *Placard and Service Billposter*, which started as the house organ of Sheldon's, Ltd., the poster experts, of Leeds, has increased in size and contains so many technical and interesting features, that it may aptly be described as a technical publication. The January issue contains, in 64 pages, articles that cannot do otherwise than interest both the advertiser and the printer. A section is also devoted to a review of current press advertising. Published monthly, the journal is priced at 1s. 6d. per copy and specimen numbers may be obtained through Sheldon's, Ltd., 85-7, Cookridge-street, Leeds.

Australian Notes.

Paper Imports — Increase in Printings, but a Decline in Wrappings and Writings — Australasian Paper Company's New Issue—New South Wales Press Conference — New President Elected—"Melbourne Herald's" Circulation — Publishing Profits—New Company.

(From Our Sydney Correspondent.)

IMPORTS of printing paper for June and July show an increase compared with the corresponding figure in the previous year, while shipments of wrapping, writing and typewriting paper are on a lower scale. Printing paper received in the two months mentioned represented a value of £407,767, as against £372,088 in June and July, 1924. Wrapping imports reached the figure of £47,470, as against £64,972, and writing and typewriting paper £72,451, comparing with £83,202.

A NEW issue of 103,500 cumulative participating preference shares of £1 each is announced by the Australasian Paper and Pulp Co., Ltd. The issue has been underwritten. The present paid-up capital is £846,500, of which £100,000 is preference.

SIR DUDLEY DE CHAIR, the Governor, honoured with his presence the twenty-fifth annual conference of the New South Wales Country Press Conference and opened the proceedings officially. In the course of an address his Excellency said he was struck by the high standard of the journals in Australia, which appeared to be most reliable and readable. In a reference to the Wembley Exhibition, Sir Dudley took the opportunity of congratulating all who had taken part in the British Empire Exhibition, which, he believed, would have lasting benefit, not only to the Empire, but to mankind in general.

MR. R. V. SMITHE, the retiring president, then delivered an interesting address, in which he dealt at some length with the attitude of the authorities to British-made news-print.

MR M. J. CONDON (Condobolin) was elected president of the Association, with the following gentlemen as vice-presidents: Mr. C. W. Dunstan (Wagga), Mr. H. Rauch (Nowra), Mr. J. Bradley (Temora).

AN important matter which engaged the attention of delegates was the Commonwealth Award concerning printers. This was taken in committee. The secretary, after reading a report of a sub-committee appointed to consider the question, said he had received a summons for a compulsory conference to be held in Melbourne, and expressed the opinion that if the main principles could not be amicably settled at the conference, it would be as well to go straight to the Court. Provision was made for a strong fighting fund to contest the claims.

IT was agreed that the association should authorise the Australasian Provincial Press Association to serve a counter log to claims made by the Printing Industry Employees' Union in the Commonwealth Arbitration Court, and that steps be taken to alter that association's constitution in accordance with the requirements of Rule 5 of the statutory rules, 1913, No. 331, of the Commonwealth Arbitration Act, 1902–11.

THE average daily net sales of the *Melbourne Herald* for the twenty-six weeks ended September 27th show a considerable increase in August and September. The highest daily circulation was on August 9th with 154,775, the nearest approach to that figure following on August 30th, viz., 145,650. The highest figure in September was on the 20th, viz., 144,446.

THE report of Smith's Newspapers, Ltd., to June 30th shows a net profit of £36,038. Dividend on the preference shares at the rate of 9 per cent. per annum accounts for £11,346, and the balance (£24,692) is carried forward. For the fourteen months ended June 30th there was a net profit on *Smith's Weekly* of £36,140. The report states that the cost of establishing the *Daily Guardian*, and net loss on its working, including preliminary expenses of the company, expenditure incurred prior to publication, etc., amounted to £101,378. Of this amount £100,000 has been transferred to goodwill and establishment account, leaving £1,378, which against net profit of *Smith's Weekly* and sundry earnings makes the net profit of the company shown at the figure stated above.

THE *Maitland Mercury* Newspaper and Printing Co., Ltd., has effected registration with an authorised capital of £30,000. Its object is to acquire the business now carried on by the *Maitland Mercury* Newspaper and Printing Co. First managing director, J. W. Rutherford. Registered office, High-street, West Maitland.

THE Australasian Association of Psychology and Philosophy has been registered to promote psychological and philosophical research, and to undertake the publication of the *Australasian Journal of Psychology and Philosophy*.

W. E. SMITH, LTD, have taken large new premises at 310, George street, Sydney. The business includes dealing in high-class stationery and fancy goods.

British Industries Fair.

It is evident from letters which have been addressed to the Department of Overseas Trade by individual firms and from articles which have appeared in certain organs of the trade press that the decision to suspend the London section of the British Industries Fair, which would otherwise have been held in February next, owing to the re-opening of the British Empire Exhibition in 1925, has caused much disappointment.

The decision was reached very reluctantly by the Department of Overseas Trade, after the members of the British Industries Fair Advisory Committee had been consulted, but it was felt that in the circumstances the interests of all concerned would be best served by the suspension of the London Section of the Fair for one year.

As previously announced, it is the intention to resume the London series of Fair in 1926. Various suggestions relating, *inter alia*, to the possible extension of their scope have been received by the Department of Overseas Trade and will be carefully considered.

In the meantime firms whose manufactures fall within the London schedule of trades are reminded that the Birmingham authorities, whose section of the Fair will be held as usual in February next, have generously undertaken as a special measure for 1925 only to organise additional sections in their Fair to accommodate firms who would normally exhibit in London, provided that the demand for space ensures adequate representation of the industries concerned.

French Import Duties.

A French Government Bill which proposes to modify the French Customs Tariff duties on some 300 articles will affect the following goods: Wallpaper, and lincrusta in two or more colours (100 per cent. increase); photographic paper (40 per cent. increase); cardboard (from 20 to 50 per cent. increase); illustrated post cards (50 per cent. increase); fashion publications (proposed new duties ranging from 120 to 400 francs per 100 kilogs.)

Representatives also in Australia, India, South Africa, Canada, Norway, Sweden, Finland, etc.

THURSDAY, JANUARY 22, 1925.

Railway Rates.

PRINTERS, stationers, papermakers, paper merchants and other allied traders are much concerned with the rates charged by railway companies, and accordingly have been supporting—through the Federation of Master Printers, the Papermakers' Association and other organisations—the Traders' Co-ordinating Committee which has been opposing certain contentions of the railway companies. Future rates must be influenced in a direction favourable to traders by a judgment given on Monday in the Court of Appeal against the railway companies, who had appealed against the decision of the Railway Rates Tribunal on certain matters of principle in regard to the fixing of the basis upon which the standard net revenue of the railway companies is to be estimated under the Railways Act, 1921. This decision, it is pointed out, will automatically result in a lessening of the amount allowed in the schedules of standard rates and fares when the Railway Rates Tribunal comes to fix, in the first place, the amount of revenue, net and gross, and then ultimately the fares and charges. The big users of the railways have been working at this and kindred problems associated with the future position of the railways since 1920, if not before, and so far two very important questions have been settled. These are the Classification of Merchandise and the Terms and Conditions of Carriage. Eleven days were spent by the Railway Rates Tribunal hearing the views of the railway companies, the Traders' Co-ordinating Committee, and other users of the railways, upon the questions of principle now settled, and the Tribunal's decision of last July is the one which was appealed against by the railway groups.

Twelve Months' Paper Imports.

IMPORTS and exports of paper last year mark advances upon the totals for 1923, a welcome sign of reviving trade. Last month paper and cardboard imports amounted to 1,247,788 cwts. (£1,272,491), an increase in quantity of 117,179 cwts. (10·3 per cent.), and an improvement in value of £110,260 (9·4 per cent.) compared with the same month a year before. The quantity and value of the imports of paper and cardboard reaching this country from all sources during the whole of last year and the two preceding years were:

1924	...	14,047,057 cwts.	...	£14,451,957
1923	...	12,626,957 ,,	...	13,592,893
1922	...	11,078,874 ,,	...	12,373,697

An analysis of the figures shows that the total quantity sent to this country last year was higher to the extent of 1,420,100 (11·2 per cent.) than in 1923, and surpassed the preceding year's total by 2,968,183 cwts. (26·7 per cent.). The value of the shipments during the year just concluded registers increases respectively of £859,064 (6·3 per cent.) and £2,078,260 (16·7 per cent.) compared with the preceding two years.

Analysis of Imports.

OF the various classes of paper imported during the year, packing and wrappings (4,226,756 cwts.) were the largest, representing a proportion of 30 per cent. of the total quantity, and an increase of 394,887 cwts. contrasted with the figures for 1923. Printings and writings (4,059,943 cwts.) amounted to 28·8 per cent., and exceeded the preceding year's arrivals by 216,024 cwts. Strawboards (3,748,978 cwts.) represented 26·4 per cent., and exceeded the volume of the previous year's consignments by 679,674 cwts. Millboards (1,284,486 cwts.) were 9·1 per cent. of the total quantity, and are up by 172,240 cwts. on the twelve months.

Supplies of Printings.

IN printings Newfoundland (1,087,322 cwts.) takes the lead with 26·7 per cent., though the decrease in the twelve months is 26,145 cwts. Finland (997,935 cwts.) occupies the second place—24·5 per cent.—her consignments being 51,167 cwts. more. Then Sweden, whose 703,571 cwts. (17·3 per cent.) reveal a substantial increase of 157,650 cwts. Supplies from Norway (522,707 cwts) were lower by 10,891 cwts., whilst those from Germany (287,679 cwts.) rose by 48,504 cwts. The only important feature of the returns relating to coated papers is the fact that Germany is again well to the fore, consignments from that quarter having risen from 58,505 cwts. in 1923 to 81,768 cwts. last year.

Sources of Packings and Wrappings.

THE largest supplier of packings and wrappings to this country last year was Sweden, with 1,620,964 cwts., 38·3 per cent. of the total received, and an increase of 371,766 cwts. on the shipments of the preceding year. Germany occupies the second place in packings and wrappings with 997,667 cwts. (23·6 per cent), a decrease of 178,943 cwts. Receipts from Norway (675,330 cwts.) represented 15·9 per cent., and from Finland (414,007 cwts.) 9·7 per cent., the respective increases being 24,935 cwts. and 93,122 cwts.

The Year's Exports.

EXPORTS of British paper were not quite so good last month as in December, 1923, although the shipments for the whole twelve months present a fairly healthy aspect. Amounting to 384,087 cwts. (£751,078) the December exports indicated a falling off in quantity of 50,770 cwts. (11·6 per cent.), and a decline in value of £47,632 (5·9 per cent.) contrasted with December, 1923. Paper and cardboard sent overseas during last and the two preceding years stood as follows:—

1924	...	4,757,943 cwts.	...	£9,229,547
1923	...	4,341,118 ,,	...	8,762,998
1922	...	2,454,177 ,,	...	6,747,765

It will be seen that there was an increase in the exports last year of 416,825 cwts. (9·6 per cent.) compared with the preceding twelve months, and a big increase of 2,303,766 cwts. 93·9 per cent.) over the total for 1922. The value of last year's exports indicates advances respectively of £466,549 (5·3 per cent.) and £2,481,782 (36·7 per cent.).

L.S.C. Jobbing Guild.

Mr. Langley's Lecture.

Eloquent testimony to the work of the L.S.C. Jobbing Guild was paid by various speakers at its monthly meeting in the Board Room of the London Society of Compositors, St. Bride-street, on Wednesday of last week. Mr. C. J. Drummond (president of the Guild) presided over a good muster of the members, and the speaker was Mr. Alfred Langley, president of the L.M.P.A., who took as the title of his address: "Letterpress Posters: A Few Ideas."

Mr. Drummond, in calling upon Mr. Langley to address the meeting, remarked that although he had not been able to attend the meetings of the Guild he had watched with great interest and delight the progress it had made since its inception. It gave him especial pleasure to preside that evening because Mr. Langley was one of the few master printers who took a very real and keen interest in the art and craft of printing. Mr. Langley's firm had produced some very fine work, and he felt confident his lecture would be full of interest. Mr. Drummond also drew attention to the presence of Mr. G. W. Jones, another distinguished printer. Mr. Drummond concluded by referring to the fact that he had helped Mr. Jones to lay his first fount of type, when he first started as a master printer in London.

At the conclusion of the lecture—which is fully reported in this issue—Mr. Langley invited the members' frank criticism of a considerable number of letterpress posters of a comprehensive range of design which he had brought for inspection, and in asking for criticism Mr. Langley confessed disagreement typographically with several of the specimens.

A considerable time was then usefully occupied in examining the various posters, and those present, in conversational fashion, freely expressed opinions as to the merits or otherwise of the various examples of work. A number of what were considered outstanding specimens were hung seriatim on the blackboard and underwent special attention. Around these many suggestions were made as to possible improvement, the principal remarks made by the various speakers touching such points as balance, spacing between letters, whites, tinting, borders, prevention of creasing of the edges, lay-outs, legibility of characters, the use of upper and lower case, and the relations of the printer and the bill-poster.

So excellent were many of the specimens considered, that Mr. Langley repeatedly had to assure his questioners that they were all letterpress productions and not lithographic.

Mr. G. W. Jones, in moving a vote of thanks to Mr. Langley, referred first to his own long-standing friendship with Mr. Drummond, and then eulogistically alluded to Mr. Langley, whom he described as one of those master printers who took a big interest in his job and spent a lot of time in speaking to his fellow master printers and to those doing the actual work of the printing office. After expressing his opinion on different type faces—including the Westminster, which he disliked—Mr. Jones said he had spoken in more than one place to brother master printers about the Guild and its work, and he congratulated the members in coming together as they did after a day's work in order to help one another. He liked the Guild because the questions asked were never trivial ones. In concluding he said he thought the successful poster should be the complete exemplification of the principle that "he who runs may read."

Mr. E. J. Davey, in seconding the vote of thanks, said he found it difficult on behalf of the Guild, to express in adequate terms their feelings to Mr. Langley for his coming amongst them. It was a real delight for all the members to listen to the instructive and interesting remarks made by Mr. Langley. Usually at their meetings they were accustomed to dealing with a small type of commercial work, but that evening their minds had been broadened and their eyes delighted at the handsome display Mr. Langley had placed before them.

Mr. A. E. Owen Jones also spoke in support of the vote of thanks, which was then very heartily accorded.

Mr. Langley, in responding, said he felt sufficiently thanked if he had created an interest in letterpress poster work, and doubly so as he had the satisfaction of having drawn Mr. G. W. Jones to the meeting. It had always been his ambition to come under the lash and criticism of Mr. Jones, and he would be able to go away from the meeting feeling satisfied that he had drawn *the* printer to show an interest in some of his (Mr. Langley's) small efforts. Mr. Langley concluded by saying that the success he had met with was largely due to the use of the best poster paper, good type and the best obtainable materials, together with good workmen, to whom he expressed his gratitude.

Mr. W. Whyte (secretary, L.M.P.A.), in proposing a vote of thanks to the chairman, referred to Mr. Drummond's long association with the industry and his desire at all times to identify himself with movements intended to uplift the craft. With regard to the Guild he assured them that its activities were being fully appreciated in all quarters that mattered.

Mr. H. B. Naylor, in briefly seconding, alluded to Mr. Drummond as a very busy man, in spite of the fact that he is reputed to have retired. He always succeeded in conducting a meeting in a happy way, whilst his presence at the Guild was a pleasurable experience.

Mr. Drummond having returned thanks the meeting was brought to a close.

Happiness for Printers.

Mr. Wise Points the Way.

"How to be Happy though a Printer" was the subject of an address delivered by Mr. J. D. Wise (past president of the South-West London M.P.A.) on Tuesday of last week at a joint meeting of the Master Printers' Associations of North London and East and North-East London. The joint meeting, which was the first of its kind, was held at Dalston, the rendezvous being Granger's Restaurant, 550, Kingsland-road. Mr. Wise, whose enthusiasm for the uplifting of the printing craft has made him *persona grata* amongst all the London District M.P.A.'s, had much to say that was helpful and inspiriting. His audience included, besides representatives of the two participating Associations, Mr. Alfred Langley, who, as president of the L.M.P.A. is indefatigable in the visiting of District Associations, Mr. W. Whyte (L.M.P.A. secretary) and Mr. J. Johnson (organiser).

After the serving of light refreshments, the chair was taken by Mr. D. A. Whitehead (past-president of the North London M.P.A.) who, before calling upon Mr. Wise to speak, disposed expeditiously of a little routine business, which included the election of two new members, one to each of the Associations represented.

Mr. Wise then took the floor and delivered his address, which comprised much sound philosophy and included quotations from many famous writers from antiquity down to modern times, together with practical hints on the achievement of financial success, a factor closely related to the subject of happiness. The speaker said he had been connected with the printing trade for over half a century, but if he had his time over again he would still choose to be a printer. Proceeding to more technical matters Mr. Wise had good advice to give on the desirability and the methods of improving one's work and equipment as a printer. He went on to touch upon the thorny question of price-cutting and the best ways to guard against it, in which connection he stressed the need for an accurate knowledge of costs as afforded by the Federation Costing System. The important subject of reducing the cost of production was briefly discussed, and then the speaker tackled the interesting subject of proprietors' wages.

Minimum Wage for Employers.

Why, he asked, should there not be a minimum rate of wages for employers? He thought every employer ought to draw his wages week by week in the same way as his workpeople, and he considered that the minimum for a competent employer should be 50 per cent. above the highest wage he paid to anyone in his employ. Taking as an example a business with a capital of £3,000 and a turnover of £4,500 a year, Mr. Wise suggested that the minimum wage of the employer might in such a case be £7 15s. a week (£403), to which might be added 6 per cent. on his capital (£180) with 5 per cent. net profit on turnover (£225), making a total income of just over £800 per annum. He suggested that any present whose receipts from their businesses were not in so satisfactory a position as this, ought not to rest content until they attained that position or at least an equivalent position proportionate to the size of their capital and turnover. Mr. Wise's whole address brought home the fact that happiness was to be achieved by following the behests of wisdom in all the relationships of life, and the aphorism with which he summed up his message was that "The Path of Happiness is the Path of Duty."

A discussion followed, in which questions and opinions were put forward on such subjects as the choice of machinery and type, price cutting and the poor return some employers seem to be content to take as the reward of their labours—amongst those participating being the chairman, Messrs. Mizen, T. D. Hawkins and Bass. At the conclusion of formal business, Mr. Whyte took up a point in respect of rather drastic treatment of the printer's customers, and in the course of some humorous remarks he suggested that if members in dealing with their customers could only terrify them as much as trade unions sometimes terrified master printers, they would do much towards enabling the officials of their organisation to retire to the Printers' Almshouses.

A very hearty vote of thanks was passed to Mr. Wise on the proposition of the chairman. Mr. Langley seconded, referring to Mr. Wise as a direct descendant of Benjamin Franklin, the great American printer, who in very happy fashion combined the function of philosopher with that of practical printer. Mr. Langley referred to Mr. Wise's valuable services to the master printers' organisation and corroborated his recommendation of the Federation Costing System. He also spoke of the benefits derivable from membership of the L.M.P.A., remarking that if he had his time over again he would not only choose to be a printer, but would start twenty years earlier to take an interest in the work of the L.M.P.A.

Trade Union Matters.

LONDON COMPOSITORS AND CHARGING TYPE.—The committee of the London Society of Compositors has issued an official notice to chapel officers that all movable heads charged by linotype operators must be at case rates. Instances have come to their knowledge, says the notice, of such matter being charged at the equivalent in machine lines, but such charging is irregular, and cannot be recognised by the Society.

"TEA MONEY" POINT AT DARLINGTON.—At a recent meeting of the executive council of the Typographical Association a communication was considered from Darlington on the question of "tea money" at the office of the *Northern Echo*. The employees there had claimed payment for "tea money" in accordance with the new rule, but the firm stated that they had been notified by the employers' association that the rule did not apply to morning newspaper workers. The Darlington branch have been notified by the Council that the matter would be raised at a meeting of the Joint Labour Committee of the printing trade.

LONG NIGHT WORKING.—The secretary of the Walsall branch of the Typographical Association has inquired from headquarters if members would be justified in refusing to work two long nights in a week at ordinary time rates in a local newspaper office. On Thursdays and Fridays the members worked from 8 a.m. to 10.30 p.m. (less meal times). The Executive Council, after consideration of the question, advised the branch secretary to interview the firm and arrange if possible for such revision of hours as would only necessitate one long night per week.

MR. H. SKINNER, secretary of the Typographical Association, has been presented by the Executive Council with a silver cigar case and cigars in recognition of his 32 years' service to the Association, for one year of which he was assistant secretary and for 23 years' general secretary.

DOUGLASS AND CO., LTD.—Capital £3,000 in £1 shares (1,000 7 per cent. cumulative preference) ; to acquire the business of an advertising agent and contractor now carried on by A. C. Douglass at 640, Royal Liver Building, Liverpool, as "A. C. Douglass and Co." Private company. Subscribers : A. C. Douglass and V. P. Douglass.

STANLEYS (GLASGOW), LTD —Capital £3,000 in £1 shares ; paper or cardboard bag and box makers, manufacturing, wholesale, retail and export stationers, printers, etc. Private company. Subscribers : D. H. Sayers and Catherine D. Munro. Registered office : 124, St. Vincent-street, Glasgow.

KEITH ADVERTISING SERVICE, LTD. — Capital £1,000 in £1 shares ; to carry on the business indicated by the title and that of lithographers and publishers, printers and art journalists, etc. Private company. First directors : A. B. Keith and T. Harris. Registered office : 546, Sauchiehall-street, Glasgow.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

DALZIEL FOUNDRY, LTD. (London).—Satisfaction in full on December 31st, 1924, of debenture dated February 24th, 1920, securing £5,000.

WINTHROP ROGERS, LTD. (music printers, etc., London).—Satisfaction in full on December 29th, 1924, of debenture dated November 19th, 1918, securing £500.

AGARD AND CO, LTD. (publishers, etc , Birmingham).—Satisfaction in full on December 29th, 1924, of first mortgage debenture dated December 31st, 1901, securing £150.

OSWALD AND CO., LTD. (manufacturing stationers, printers and pattern card makers, etc., London).—Satisfaction to the extent of £750 on December 30th, 1924, of two debentures dated May 17th and September 20th, 1904, securing £1,000.

LOXLEY BROS., LTD. (printers, etc.) —Mortgage and two land registry charges on certain properties in Sheffield and London, all dated December 16th, 1924, to secure all moneys due or to become due from the company to the Midland Bank, Ltd., respectively.

G. E. STEVENS, LTD. (printers, etc , Coventry).—Particulars filed of £450 debentures authorised January 6th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

PRESS ASSOCIATION, LTD.—Satisfaction to the extent of £6,500 on December 23rd, 1924, and to the extent of £1,000 on January 1st, 1925, of mortgage dated May 14th, 1923, securing £55,000.

UTILITY AND GENERAL PUBLICITY CO., LTD. (London).— Particulars filed of £1,000 debentures authorised January 2nd, 1925, charged on the company's property, present and future, including uncalled capital, the amount of the present issue being £250.

YOUNGMAN BROTHERS, LTD. (wholesale and export stationers, etc., London).—Debenture dated January 6th, 1925, to secure £200, charged on the company's undertaking and property, present and future, including uncalled capital. Holders : G. E. Kaye, Ltd., 8, Botolph-lane, Eastcheap, E.C.

HOLMES TYPEWRITER AND STATIONERY CO. LTD.—Mortgage on 45, Prince of Wales road, Norwich, dated December 29th, 1924, to secure all moneys due or to become due from the company to the Midland Bank, Ltd.

GREENFIELD AND CO., LTD. (cardboard box manufacturers, etc., Manchester).—Satisfaction in full on December 9th, 1924, of mortgage dated August 12th, 1921, securing £1,500.

SAMUEL JONES AND CO., LTD. (gummed papermakers and paper glaziers, etc., office, London).—Two mortgages dated December 19th, 1924, to secure £550 each, charged on 45 and 47, Sandringham road, Watford. Holders : Borough of Watford.

JEFFREY AND CO., LTD. (wall-paper manufacturers, etc., London).—Satisfaction in full on December 19th, 1924, of charge dated February 20th, 1923, securing £15,500.

BURY PAPERMAKING CO., LTD.—Issue on January 7th, 1925, of £300 debentures, part of a series already registered.

BANKRUPTCIES, etc.

Re ARTHRUDE PRESS, LTD., 6, Wheeler-street, Commercial-street, E.—The report of Mr. E. T. A. Phillips, official receiver, upon the affairs and liquidation of this company has been issued to the creditors and shareholders. The accounts filed under the liquidation show liabilities £8,850, assets valued at £714, and a deficiency of £9,272 as regards contributories, the issued capital being 2,000 ordinary shares of £1 each. The company was incorporated as a private company on January 6th, 1922, to establish and carry on business as wholesale paper and string merchants, general printers, stationers, etc. It was promoted by Arthur Shurek, who for several years prior to its formation had carried on a similar business and who established a new one in order to obtain the advantage of trading with limited liability. The failure was attributed by Shurek to loss of £6,573, by a fire in August, 1922, and the expenditure of large sums of money on unsuccessful legal proceedings instituted against an insurance company. In the opinion of the official receiver the failure was contributed to by payments made to directors in 1924. Mr. Albert Willmott, C.A., 14, Old Jewry-chambers, E.C., has been appointed liquidator with a committee of inspection.

Re LANGHALL AND WADE, printers, designers, and manufacturers' stationers, 10, South-street, E.C.—This firm failed in March, 1921, and an application for an order of discharge was made on January 16th at the London Bankruptcy Court by Cutbert Collingwood, one of the partners. Mr. F. Vyvyan, official receiver, reported that the joint liabilities amounted to £4,072, and the assets realised £1,852, out of which a dividend of 6s. 2¾d. had been paid by Mr. Albert Willmott, the trustee. The applicant joined the firm in May, 1920, and introduced a capital of £1,000 in consideration of being admitted a partner on equal terms with Ernest Langrish, Stuart Edward Wade and Howard Matthew Langrish, who then carried on the business at South street. In May, 1920, the firm purchased an existing business of a printer at 147, Haydon's-road, Wimbledon, but they only paid £1,150 of the purchase price of £2,100. In February, 1921, their stock was removed by the sheriff under three executions and the business came to an end. The failure was attributed to heavy interest on borrowed money and loss on paper stock owing to the slump in trade. Insufficiency of assets to equal 10s in the £ on the amount of the liabilities and omission to keep proper books of account were charged by the official receiver, and his Honour granted a discharge subject to judgment for £5, to be satisfied by an immediate cash payment.

CASTELL BROS., LTD., stationery manufacturers, Pepys Works, Clerkenwell-road, London, have joined the Federation of British Industries.

Mathieson v. Gronow and Others.

Judgment for Defendants with Costs.

This action, before Mr. Justice Shearman and a special jury, in the King's Bench Division, was concluded on Monday when judgment was entered for the defendants with costs.

The plaintiff, Mr. Gerald John Mathieson, claimed damages against Mr. Gronow, Mr. Bryant, Mr. Bourne, Mr. Burrup and Mr. Harrison for alleged misrepresentation in regard to the purchase by Mr. Gronow of the plaintiff's interest in certain shares in Burrup, Mathieson and Sprague, Ltd., printers and stationers.

The plaintiff alleged that he had entered into a contract with Gronow for the sale of all the shares in the company for £60,000 and that he was induced to enter into a fresh contract for sale at a lower figure by the misrepresentation of the defendants to the effect that Gronow could buy the shares from Mathieson's bankers, with whom the shares were pledged, at a lower figure.

It transpired in the course of the evidence that Mathieson's shares were mortgaged to his bankers for about £12,500, that a considerable holding was registered with the Public Trustee to secure an allowance for maintenance to Mathieson's first wife, from whom he was divorced, and that in addition there was an agreement for an ante nuptial settlement in favour of his second wife, by which he had assigned the whole of his assets, including the said shares.

It was absolutely denied on behalf of each of the defendants that there was any agreement to purchase his interest in the shares for £60,000, and that there was any misrepresenation of any kind on the part of the defendants.

The jury, in answer to the Judge's questions, found that there was no agreement by Gronow to purchase the shares for £60,000, and that there was no misrepresentation whatever on the part of the defendants, and the Judge directed that judgment be entered for the defendants, with costs.

THE Exhibition of Foreign Samples, a permanent feature of the Foreign Samplesa nd Foreign Catalogues Section of the Department of Overseas Trade, has been removed from Old Bailey to the Department's headquarters at 35, Old Queen-street, London, S.W.1.

THIS year will be celebrated the completion of the first quarter century of the Gutenberg Museum, in Mainz, Germany, and of the Gutenberg Society associated therewith. To celebrate the occasion a special international festival publication is to be produced, and there will also be held an exhibition setting forth fine German book-productions since 1900.

New British Patents.

Stationers' Company Livery.

The activities of the progressive Livery Committee of the Worshipful Company of Stationers have broken out in a new direction which has given great satisfaction to the younger members of the Livery. On Thursday, January 15th, a dance was arranged for the Livery and their friends at Stationers' Hall when a large number of prominent people in the City and printing circles were present and spent a most enjoyable evening.

The company was received by the Master, Mr. Richard Bentley, F.S.A., and Mr. and Mrs. R. A. Austen-Leigh. The arrangements were in the hands of the hon. secretary, Mr. J. R. Riddell. So successful has been the first Livery dance that requests have already been made that it should be repeated in the near future.

This gathering is additional evidence that the Livery Committee is doing a valuable work by bringing together the various interests represented by the Worshipful Company of Stationers, not only for educational work but also for the social side. This must redound to the welfare of the Company and materially assist towards making Stationers' Hall the real centre of the great printing industry.

Openings for British Trade, etc.

Inquiries have been received by the Department of Overseas Trade (Development and Intelligence), 35, Old Queen-street, London, S.W.1, to whom further inquiries should be addressed with the reference number quoted.

DENMARK.

A firm of agents in Copenhagen are desirous of securing the representation in Denmark of British manufacturers of printers' ink and cotton wool for engravers. (Reference No. 54).

EGYPT.

The Surveyor-General of Egypt, Giza (Mudiriya), is calling for tenders for the supply of lithographic plates. Tenders are due in Egypt by March 18th, 1925. Particulars can be obtained from the Inspecting Engineer, Egyptian Government, Queen Anne's-chambers, London, S.W.1. (Reference No. Survey 2-4-3).

Web Fed Rotary Offset.

Mr. F. J. Connolly (of Messrs. Francis J. Connolly, Ltd., sole agents for Marinoni-Voirin, Paris) writes us with reference to our report last week (page 37) of the discussion that followed Mr. Gamble's lecture at Stationers' Hall on "The Trend of Photo-Engraving and Photo-Offset Printing." Mr. Connolly, taking part in the discussion, referred to the output capacity of web fed rotary offset machines. He desires us to make plain that in his remarks he was referring only to the Marinoni-Voirin machine, which is so designed that the blanket cylinders run in contact with each other. Both sides of paper are printed simultaneously, with a normal running speed of 3,500 per hour, automatically fed. Delays in the continuous running of the machine owing to damping deficiency are minimised, because in this machine the damping apparatus is so perfectly designed and damping control so absolute that 25 per cent. would be the maximum allowance that would have to be deducted from the running speeds in order to compute the normal daily output.

It may be pointed out that the Marinoni-Voirin machine, as now running in London, is web-fed only in the sense that the paper is on a reel, fed through an apparatus which automatically cuts it into sheets of any size required before delivering it to the printing machine—hence the low running speed of 3,500 sheets per hour. The suppliers estimate that a web-fed machine of similar construction should run at 10,000 per hour.

British Paper in New Zealand.

Mr. A. W. Foster, the secretary of the Paper-makers' Association, has now received an official intimation from the Customs authorities in New Zealand as to the conditions under which paper manufactured in Great Britain or other British possessions from foreign pulp is to be dealt with after March 31st next.

"It is found," states the letter, "that before a final decision can be made it will be necessary to have certain inquiries made in Great Britain, and possibly also in Canada, but the Minister has decided that until April 1st, 1926, paper made wholly in Great Britain or other British possession from foreign pulp will be regarded as wholly manufactured in such British countries for the purpose of Clause 5 (a) of the certificate.

"This means," it is added, "that paper made wholly in Great Britain or any other parts of the British dominions from wood pulp of foreign origin will, if other conditions are complied with, be entitled until March 31st, 1926, to be entered for duty on importation into New Zealand under the British preferential tariff, even though 75 per cent. of the factory or works cost is not represented by British materials and/or labour."

OCCUPATIONAL statistics for 1921, which have just been issued, show that makers of and workers in paper, printing, bookbinding, photography, etc., were 168,518 males, and 109,853 females in England and Wales.

Enterprise of the House of WINDEBANK.

This firm of wholesale and export paper merchants and envelope makers was established five and a half years ago, and so rapid has their progress been that their present factory, into which they moved in April, 1924, comprises floor space of 18,000 square feet, and large area for future extension. The accompanying illustration shows the substantial

character of the building and at the same time gives some idea of the accommodation provided for stocks of various grades of paper, etc., and for the modern machinery used in the manufacture of envelopes.

Very close thought has been given to the lay out of paper store-rooms and factory, with a view not only to efficiency on the warehouse and mechanical side, but also with the object of looking after the comfort of the workpeople and enabling them to perform their various duties with interest and alertness.

A representative of the *World's Paper Trade Review* had the pleasure recently of being conducted over "Premier Works," where he found room after room humming with activity. A splendid array of machinery for the manufacture of envelopes, and also for the various processes appertaining thereto, have been installed.

The machines work with almost human perfection and are adapted for the manufacture of every variety of envelope. Special machinery has been put down with the object of meeting the growing demand for window envelopes.

Another design of envelope which is also greatly in vogue by reason of the new postal regulations is the non-trap envelope, and in order to meet this demand new plant has been set up.

In the conduct of their business the management of Windebank and Co., Ltd., realise the necessity of looking after the welfare of their workpeople, and to this end they have recently opened a canteen, where the employees can obtain good food at very reasonable prices, an arrangement which has proved an unqualified success. There are also in contemplation out-door recreation facilities, which will be provided on the roof of the building.

Messrs. Windebank are fortunate in having the assistance of gentlemen who have had extensive experience in the handling of goods they stock, and in the manufacture and sale of the commodities they produce. Mr. Windebank, who is managing director, personally superintends the paper section of the business. Mr. A. Longhurst, director, has control of the envelope and manufacturing side. Mr. G. Parsons, director, is senior representative. The experience which these gentlemen are able to bring to bear upon their work is having its effect upon the growing reputation of the business.

THERE are few more important economic problems in the present distracted world than the devising of a simple and solvent system of insuring trade credits, especially for overseas business.

Web Fed Rotary Offset.

Mr. F. J. Connolly (of Messrs. Francis J. Connolly, Ltd., sole agents for Marinoni-Voirin, Paris) writes us with reference to our report last week (page 37) of the discussion that followed Mr. Gamble's lecture at Stationers' Hall on "The Trend of Photo-Engraving and Photo-Offset Printing." Mr. Connolly, taking part in the discussion, referred to the output capacity of web fed rotary offset machines. He desires us to make plain that in his remarks he was referring only to the Marinoni-Voirin machine, which is so designed that the blanket cylinders run in contact with each other. Both sides of paper are printed simultaneously, with a normal running speed of 3,500 per hour, automatically fed. Delays in the continuous running of the machine owing to damping deficiency are minimised, because in this machine the damping apparatus is so perfectly designed and damping control so absolute that 25 per cent. would be the maximum allowance that would have to be deducted from the running speeds in order to compute the normal daily output.

It may be pointed out that the Marinoni-Voirin machine, as now running in London, is web-fed only in the sense that the paper is on a reel, fed through an apparatus which automatically cuts it into sheets of any size required before delivering it to the printing machine—hence the low running speed of 3,500 sheets per hour. The suppliers estimate that a web-fed machine of similar construction should run at 10,000 per hour.

British Paper in New Zealand.

Mr. A. W. Foster, the secretary of the Paper-makers' Association, has now received an official intimation from the Customs authorities in New Zealand as to the conditions under which paper manufactured in Great Britain or other British possessions from foreign pulp is to be dealt with after March 31st next.

"It is found," states the letter, "that before a final decision can be made it will be necessary to have certain inquiries made in Great Britain, and possibly also in Canada, but the Minister has decided that until April 1st, 1926, paper made wholly in Great Britain or other British possession from foreign pulp will be regarded as wholly manufactured in such British countries for the purpose of Clause 5 (a) of the certificate.

"This means," it is added, "that paper made wholly in Great Britain or any other parts of the British dominions from wood pulp of foreign origin will, if other conditions are complied with, be entitled until March 31st, 1926, to be entered for duty on importation into New Zealand under the British preferential tariff, even though 75 per cent. of the factory or works cost is not represented by British materials and/or labour."

OCCUPATIONAL statistics for 1921, which have just been issued, show that makers of and workers in paper, printing, bookbinding, photography, etc., were 168,518 males, and 109,853 females in England and Wales.

Enterprise of the House of WINDEBANK.

This firm of wholesale and export paper merchants and envelope makers was established five and a half years ago, and so rapid has their progress been that their present factory, into which they moved in April, 1924, comprises floor space of 18,000 square feet, and large area for future extension. The accompanying illustration shows the substantial character of the building and at the same time gives some idea of the accommodation provided for stocks of various grades of paper, etc., and for the modern machinery used in the manufacture of envelopes.

Very close thought has been given to the lay out of paper store-rooms and factory, with a view not only to efficiency on the warehouse and mechanical side, but also with the object of looking after the comfort of the workpeople and enabling them to perform their various duties with interest and alertness.

A representative of the *World's Paper Trade Review* had the pleasure recently of being conducted over "Premier Works," where he found room after room humming with activity. A splendid array of machinery for the manufacture of envelopes, and also for the various processes appertaining thereto, have been installed.

The machines work with almost human perfection and are adapted for the manufacture of every variety of envelope. Special machinery has been put down with the object of meeting the growing demand for window envelopes.

Another design of envelope which is also greatly in vogue by reason of the new postal regulations is the non-trap envelope, and in order to meet this demand new plant has been set up.

In the conduct of their business the management of Windebank and Co., Ltd., realise the necessity of looking after the welfare of their workpeople, and to this end they have recently opened a canteen, where the employees can obtain good food at very reasonable prices, an arrangement which has proved an unqualified success. There are also in contemplation out-door recreation facilities, which will be provided on the roof of the building.

Messrs. Windebank are fortunate in having the assistance of gentlemen who have had extensive experience in the handling of goods they stock, and in the manufacture and sale of the commodities they produce. Mr. Windebank, who is managing director, personally superintends the paper section of the business. Mr. A. Longhurst, director, has control of the envelope and manufacturing side. Mr. G. Parsons, director, is senior representative. The experience which these gentlemen are able to bring to bear upon their work is having its effect upon the growing reputation of the business.

THERE are few more important economic problems in the present distracted world than the devising of a simple and solvent system of insuring trade credits, especially for overseas business.

The Paper and Board Consumer.

Matters of Interest to Printers, Bookbinders, Paper Box, Paper Bag, and Envelope Manufacturers, etc.

THE Paper Trade Customs reprinted in various annuals and diaries for the current year adhere to the clause which states that a ream of printing or writing paper contains 500 sheets. Far from having become the custom of the trade, it is quite unusual to drop across the 500 sheet ream. There is no trade custom at all in respect to ream content, and quite a number of papermakers and merchants do not even go so far as to indicate how many sheets there are in a ream of paper. There is less paper-labelling to-day than in the early days of paper trading, when labels were almost compulsory. Within the last few days we heard of a printer who issued 200 reams of expensive double-demy which was assumed to be 500 sheets per ream. Actually there were 516's, and about 6½ reams of printed paper went into the waste bags. Of course, the printer should count and clock his reams, even though the very fact of such necessity reflects small credit on the customs of the paper trade, which appear to be the omission of any reference to sheets per ream except on printed sample sheets. While there is so much confusion as to what a ream is, every ream wrapper should be stamped and every invoice or sample specified.

* * *

THE decision of the Board of Trade to differentiate between kraft and other types of wrapping is a welcome progressive step. No single class of paper has made such headway within recent years, if we except newsprint, whose development has been automatically controlled by the progress of the press. Kraft wrapping has made its own market very largely by its own excellent character and at the expense of other types of wrapping, in the manufacture of which English mills were particularly adept. Less and less is seen of the rope brown and glazed ochre that were English staples at the commencement of the present century. There will always be a market for those types of English wrapping associated with the textile, cutlery and foodstuff industries; and when the real trade revival comes along, there will be less dependence upon kraft substitutes at some of our mills. But kraft will always hold pride of place in tonnage of consumption and it will be very useful for us to have reliable statistics to which we can refer in our future quests for information.

* * *

DUTCH strawboards are on offer to the bookbinding and box-making industries at prices round about £9 to £9 10s. per ton according to locality. These prices are from agents' stores. The demand has been extremely good since the commencement of the year. White wood pulp boards are from £16 10s. to £18 per ton.

* * *

TURNING over some old notes, the writer recently came across a summary of some of the paper prices current in 1920, from which the following are culled: Esparto writings, 1s. 1b.; wood-free writings, 10½d. 1b.; common bank paper, 1s. 1b.; tub-sized watermarked fine banks, 1s. 6d. 1b.; standard ledger papers, 1s. 4d. 1b.; gummed demy printing, 35s. per ream; wood-free M.F. printings, 10d. 1b.; pure S.C., 1s. 1b.; manilla label paper, 1s. 1b.: tinted banks, 1s. 3d. 1b.; hand-made ledger, 3s. 1b. Comparison with current figures shows that if there was a ramp at the time, it chiefly touched the popular cheap paper. The hand-made ledger at 3s. is just over 2s. 6d. to-day, and the 1s. 4d. ledger papers are all listed now at 10d. to 1s. 10. while esparto writing is 3¾d. to 4¼d., wood-free writing 3¾d. to 3¾d., common bank, 3¾d. to 4d., gummed demy printing 13s. ream, manilla label 3¾d., and tinted bank, 4d. 1b. For the tub-sized watermarked banks to-day's prices are 1s. per 1b. Relatively, just as the cheaper classes of paper were so much higher in 1920, they are to-day so much lower in comparison with rag and tub-sized papers. Esparto papers average about 33 per cent. above pre-war prices, wood-free papers are on almost a 50 per cent. level, while tub-sized writings and ledger papers (excepting hand-mades) are in the region of 75 to 100 per cent. in advance of 1914 prices.

New Trade Marks.

448,451. Cigarette papers made from Egyptian Rice. Samuel Roses, 7, Rue Marius Jauffret, Marseilles, France, manufacturer.—May 16th, 1924. (To be associated. Sect. 24.) Address for Service in the United Kingdom is, care of Cruikshank and Fairweather, 65-66, Chancery-lane, London, W.C.2.

Presentations at Penicuik.

Mr. Thomas Ainslie, Mr. George Dickie and Mr. John Kirkwood, cashier, head foreman and head engineer respectively at Valleyfield Mills, Penicuik, recently retired after 50, 59 and 35 years' service, and at a social meeting of the workers, held in the Cowan Institute, Penicuik, on Saturday last, presentations were made from the directors in recognition of their long and faithful service.

Mr. J. J. Cowan, the oldest representative of the Cowan family, now about 77 years of age, referred to the long periods of service of the recipients, and conveyed the good wishes of the directors in handing over the silver rose bowls and painting, the latter being presented to Mr. Ainslie.

The social meeting was under the auspices of the recently-formed Welfare Committee, the origin of which had been largely due to the efforts of Mr. P. le D. Tree, the manager.

Mr. Alexander Cowan, who presided, referred to the success of the scheme and hoped it would continue to the mutual benefit of all parties. They were all the better for knowing each others' difficulties.

Good Inks mean Better Production

Mr. Percy W. Kennett.

Series of Presentations on Leaving Spicers, Ltd.

On leaving the directorate of Spicers, Ltd., to become a partner in the firm of Herring, Dewick and Cripps, Mr. Percy W. Kennett is the object of a series of presentations from his co-directors and colleagues at Blackfriars House. On Jan. 13th he was the guest of the directors of Spicers, Ltd, at a luncheon given in his honour at the Reform Club, Pall Mall. Mr. H. G. Spicer (chairman of the company)

Photo, Elliott & Fry, London.

MR. P. W. KENNETT.

was in the chair, and there were present, in addition to the guest, Sir Howard Spicer (vice-chairman), Messrs. A. Dykes Spicer, Douglas Spicer, J. Leonard Spicer, J. T. Steele, W. Oliver, S. R. Wycherley, A. E. Brown, F. L. Cayzer, C. E. Higgins, H. F. Higgins (directors of the company), and Messrs. T. K. Mackenzie, H. J. Mardling, A. E. Huckett, R. Baker, S. McCandlish, S. Perkin, J. Wright (members of the staff).

After an excellent lunch, served in a private room of the Club, the chairman said they were met to bid farewell to one who had been a colleague of a number of them for very many years. Mr. Kennett was closing a chapter in the business of Spicers of just thirty six years, and of that part he (the speaker) had been in close touch with him for thirty years. During the whole of that period he did not recall a real disagreement. Now, what could he say about Percy Kennett? In the first place he had been an indefatigable worker, frequently at the cost of health. He (Mr. Spicer) had never known a more efficient worker, and he had been undoubtedly a friend and helper of everyone with whom he had come in contact in business. (Hear, hear). Again, it was bare justice to say that their guest had always taken a real pride in the work he had done. Another rare characteristic he had was a great facility for making friends. He very much doubted whether he has ever made any enemies, which was something to be proud of. Though there was a certain tinge of regret in parting, he (the chairman) would equally say that he did not see any sadness in that farewell gathering. (Hear, hear.) When Mr. Kennett came to him at Christmas and asked for advice as to whether he should stay or go, when he gave the facts frankly and fully, it was clear to him (Mr. Spicer) that he should take up the post to which he was going. He put the matter to Sir Howard Spicer and they were in perfect agreement. It was distinctly a promotion for their friend, and he thought they should be content and satisfied that the trade took one of them to become a partner. (Hear, hear.) He is not going to a house in any sense a competing house. They would do everything they could to work harmoniously together and he had it from their guest and from the firm that it will be the means of doing a still larger business with the Spicer mills. (Applause). It was the fervent hope of all of them that Mr. Kennett would succeed in his new sphere. (Applause).

Sir Howard Spicer was very glad to have that opportunity of paying his testimony to Mr. Kennett's work. He had not known him so long as Mr. Harry Spicer or Mr. Steele, but he had known his reputation in the trade for a great many years, and he had always admired him. Directly he (Sir Howard) heard where Mr. Kennett was going, he felt very proud that the House of Spicer had had one of their head men chosen to fill the post. The speaker added that he wished to include Sir Albert Spicer in his remarks, because he knew what a very high opinion Sir Albert formed of Mr. Kennett.

Mr. J. T. Steele said Mr. Kennett and he had been messmates for all the years of his business life. They had sailed in smooth waters and stormy; they had seen captains come and go; but they had felt all the time a great pride in the ship, as if it were their own. (Hear, hear.) Now Mr. Kennett was about to change ship, but they would still sail in the same seas, and always as they passed they should dip their flags until the time came when their voyages were over and they had arrived at the haven where they desired to be. (Applause) He wished Mr. Kennett health, happiness and prosperity, and the best of luck in his new venture. (Cheers)

Mr. A. E. Brown also paid a tribute to Mr. Kennett on behalf of all those who came from 50, Upper Thames-street. The harmony of the staff to-day was a testimony to his goodwill.

Mr. T. K. Mackenzie also spoke.

Mr. H. G. Spicer then handed to Mr. Kennett a substantial cheque on behalf of the directors.

Mr. Kennett, in returning thanks, assured those present that it was no great pleasure to leave Spicers. It was not 36, but nearly 38 years since he went into Spicers as a boy straight from the country. Mr. Harry's father and his uncles—Mr. Henry, Mr. William Gage and Mr. Gus Spicer—were there then. It was an awful task, coming from looking after sheep and pigs, to dealing with paper and making out invoices. (Laughter.) The mere change was bad enough. Still, they learnt a lot. (Hear, hear.) Referring to his being put on to a department, Mr. Kennett said that day he began to move, and at the age of eighteen he was buying printings for Spicer Brothers. He had been buying printings ever since and never regretted it. Mr. Harry was good enough to say he had worked. He had enjoyed the work, and he had never regretted the day he went to Spicers. (Applause.) Mr. Kennett added that the amalgamation of the Spicer businesses had done them good in many ways, and his wish was that Spicers should go ahead. He left in the way he should like to leave, and that was with the good will of all. (Cheers.)

Fulfilling a Paper Order.

On Wednesday, January 7th, the manager of the Remington Kraft Paper Mill, Retford, Notts (Mr. Mellor), promised a delivery of paper by Friday, and to hasten delivery undertook that it should go by road transport. Friday morning came, finding the lorry all loaded ready for an early start, but no driver present. Later a message came that the usual driver was confined to bed with influenza, and without more ado, rather than break a promise, Mr. Mellor took the wheel, and drove the journey, well over 100 miles, thus fulfilling his promise, and proving the old adage true, that "every separate branch of knowledge adds another pair of hands to a man."

QUARTERLY EXPORT ISSUE—MARCH 19, 1925.

PUBLICITY AND PRINT

are inseparable. One could not exist nowadays without the other.

Newspaper Publicity is a necessity to the modern business. Publicity must, however, be undertaken systematically with the right journal or journals—journals with a recognised reputation.

The selling power of space depends upon a reputation backed by results, and these results must tell every time. Reputations are, however, not made in a day.

It has taken some forty years to establish the present-day reputation of the **Quarterly Export Issues** of the

British & Colonial Printer & Stationer

At the present time this Journal is the recognised overseas medium of the Printing and Allied Trades.

It circulates among buyers in the following markets:—

Australasia	**China**	**South America**
India	**Japan**	**Canada**
East Indies		**United States**
West Indies		**South Africa**

RESULTS

One of the most successful of our advertisers says:—

"It will no doubt interest you to learn that during the past few years we made considerable additions to, and have extended our Export Dept. We thank you for the assistance that your journal has contributed towards this export business."—C. B., Ltd.

The next issue will be published on Mar. 19.

Can you afford to neglect this opportunity of extending your export trade?

LOVE'S PAPER RECOVERY MACHINE.

Patented (No. 144485) by Joseph Love.

THIS Machine has been invented for the purpose of speedily recovering the small quantities of paper left on centres or spools which are thrown out from Printing Machines, etc. (commonly known as "Reel Ends"), so that it may be cut into suitable sizes by the Guillotine.

CHIEF ADVANTAGES:

1.—No spindles, bars, or cones are required, the reels being kept in position by a patent spring device thus saving time and labour in loading and unloading.

2.—It occupies a space of only six feet on the run, and is quite noiseless.

3.—The power required is such a small amount that it can be driven from any existing shafting

4.—Centres of any kind or width can be worked on the machine.

5.—It can be run at the high speed of 500 feet per minute, and will recover approximately 3 tons of paper per day.

6.—It can be constructed to suit all requirements in the off-cut trade, and is equally valuable to Printers or in Paper Mills.

MACHINES SUPPLIED FROM STOCK.

Printing Inks: Manufacture and Use.

By W. ILSTON COX

(Messrs. Shackell, Edwards and Co., Ltd.).

It would appear almost unnecessary to say that the date when printing ink first made its appearance synchronised with the production of the first type. This, however, was not the case, as ink preceded type by several centuries, it being used on engraved blocks, on to the blackened surface of which the printing material was pressed by hand. Unlike the engraving of later years, the ink was smeared on to the surface of the block and not into the crevices, so that it produced an impression showing white letters or characters.

The Chinese are said to have produced the first printed documents several years before Christ, but the earliest records of any value are as late as the tenth century A.D. It was nearly 500 years later that printing as we understand it came into being and almost another two centuries before we find the first reference to the making of printing ink. It is interesting to note that although a number of oils were tried in the early days for making printing inks the one in use to-day, which, as you know, is linseed oil, was the one first used by the pioneer printers.

There seems to have been a considerable difference of opinion in the seventeenth century as to whether it was better to boil the lamp black with the oil or blend it afterwards when the oil was cold and had assumed the viscosity of varnish. In those days printers made their own ink and it was some time before they compared notes and decided that it was the better plan to grind the carbon into the cold varnish. In a book by Joseph Moxon published in 1683 we find one of the first references to the professional printing ink maker, and evidently the ink maker of that day was a very unreliable person, as a number of printers continued to make their own ink for the next one hundred years, and the firm with which I am associated were actually printers to George III before they became makers of printing ink under his patronage. The quality of the ink they made brought them orders from other printers, and before the end of the eighteenth century the demand for this product so far exceeded their output of print that they gave up the latter and confined their attention to the trade of ink making.

So far I have only referred to black inks, as in the early printed books, in which colour appeared in the initial letters, it was usual to add this by hand.

Lecture delivered at Stationers' Hall, on January 9th, 1925, under the auspices of the Stationers' Company and Printing Industry Technical Board.

Improvements in the manipulation of inks of all kinds were continuous until the Great War, when the trade had a severe shock. Inferior substitutes for linseed oil and low quality colours had to be employed in some cases, and these, coupled with the dilution of skilled labour, caused a set-back without parallel in our generation.

Modern Ink Progress.

Coming now to the manufacture of modern ink I think one may say that the progress that has been made has very closely followed the development of printing machinery and the greater variety of methods of printing that are to-day employed. Machinery for making inks has developed to no less an extent than the machines on which ink is used. For many years, and even centuries, printing inks were ground by hand with a stone muller on a stone table. After lithography was invented, old lithographic stones often formed the table, and a pear-shaped piece of granite, worn flat at one end and as large as a man could grasp in his hand, became the muller. When triple roller mills came into use the rolls were about half the width and half the diameter of those now employed. A man could then easily hold a roll in his hand, whereas to-day, the three rolls in each mill weigh about a ton.

A number of ink makers drive their mills by electricity, but the practice is by no means universal, as considerable gearing down is needed to enable the mills to run at the moderate speed required for good grinding. Too great a speed leads to overheating of the colours and tends to the deterioration of the ink and impurity in tone. In the case of bronze blue, which causes the rolls to become so hot that they cannot be touched by the hand, it is possible for the ink to give rise to spontaneous combustion after it has been withdrawn from the machine.

Ink Grinding Mills.

For this and other reasons water-cooled mills are now in use for grinding certain colours. The two back rollers of each mill are the grinding pair, and turn inwards. There are cheeks at the outer ends so that a trough is formed into which the colour and varnish are placed after they have been weighed out and blended in a mechanical mixer. The two rolls and cheeks are so finely adjusted that it is possible to pour in a gallon of water and have no sign of a leak. In addition to the rotary motion of these two rolls the middle one has a lateral movement, which adds to the efficiency of the grinding. The front roll of the three rotates towards the operator and is the delivery roll, against which a sloping steel tray is closely fitted to receive and deliver the ink into the stock pan.

The number of grinds given to an ink varies considerably, and not necessarily in proportion to the quality of the colour, but rather on account of the nature of the many different pigments that are in use. I once heard a printer say that blue litho poster ink ought to be cheap because it is only laundry blue ground in boiled oil. In point of fact it is made with an ultra marine that is considerably better than a laundry blue, and as it is one of the harder colours to grind and requires putting through the mill many times to obtain a smooth ink of good body, it should not be regarded as a cheap ink.

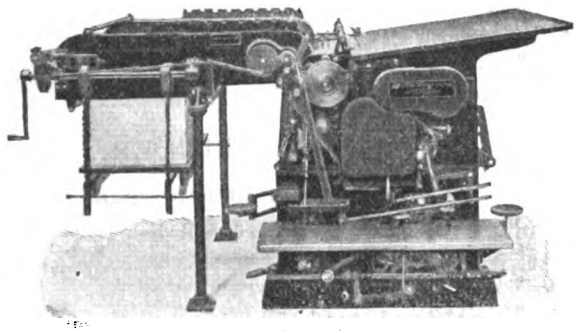
When the milling of an ink is finished it is either fed into a stock pan to be "potted off" when cold, or run into the tins in which it is sent to the printer. In the latter case the lids are better not put on the tins until the contents have cooled. The former method is the better, although more trouble, because it is not always possible to check the body of an ink as accurately when warm as when it is cold.

Probably the greatest event in the memory of living ink makers was the introduction of aniline dyes in the latter part of Queen Victoria's reign. But for this discovery it is possible that colour printing from fine-screen blocks would never have succeeded, or at all events it would not have been a serious competitor of lithography.

Different Classes of Inks.

The various inks that are in use to-day are all named after the particular work or purpose for which they are devised, and I will now give a brief idea of how each is made.

Broadly speaking there are three methods of printing: Relief printing, or impressions from raised surfaces; surface printing from a given level; and intaglio printing, from surfaces that have been hollowed out. The first method provides the greatest variety of processes. Chief among these is letterpress printing, and in this one category there are many classes of ink. Newspaper qualities are the largest in bulk, but book printing is older and should come first.



A good black book ink is to-day made from a carbon black which comes from America, and is obtained by burning a natural gas, and collecting the powder which is deposited in the smoke chambers. When purified, this is afterwards ground into

L&M

OFFSET LITHO ROTARY

WITH PILE DELIVERY.

FEED SIDE OF THE L&M OFFSET LITHO ROTARY WITH PILE DELIVERY.

This is a two-revolution press—a very desirable feature in a machine for colour printing in dead register. The printed sheets are delivered face up on the pile clear of the machine at a convenient height for examination. The plate cylinder is of large diameter, which facilitates perfect inking, damping, and manipulation of the plate. The damping mechanism is placed below the plate cylinder, so that splashing of water does not affect any other part of the machine. The ink distribution is highly efficient. A combination mechanism automatically trips the impression cylinder, inking rollers, ink-ductor, and water-ductor rollers. The machine attendant can fully control the press without leaving his seat.

It is built with Pile Delivery, but can be supplied with an ordinary delivery board if desired.

This Offset Press is built in three sizes:—

Machine No.	Size of Sheet.	Size of Design.
	in. in.	in. in.
No 1	37½ x 52	37 x 52
No. 2	33½ x 45½	33 x 45½
No. 4	25 x 37	24½ x 37

LINOTYPE & MACHINERY LTD.
9 KINGSWAY, LONDON, W.C.2

the linseed oil varnish, which the larger ink manufacturers make for themselves. A good deal of care is required in making this varnish. It is generally prepared in copper or aluminium pots of half a ton capacity, and taken gradually to a temperature of about 600 deg. F. This operation usually takes the whole of a working day of eight hours, and it is complete when the oil has become free from grease and assumed the necessary thickness for making a printing ink. This thickness, or viscosity, as it is called, varies with different inks and according to the season of the year, although linseed is less sensitive to changes of temperature than some other oils.

There are small quantities of other ingredients in a book ink besides those stated, but these vary according to the class of paper employed. It is hardly necessary to mention that the heavy glazed papers in use twenty years ago needed a different ink from that required by the absorbent feather-weight stock used so extensively to-day.

Newspaper inks when first made for the early news sheets that preceded the daily newspaper were, in common with other inks, made with linseed oil varnish. Modern requirements, in the shape of fast rotary presses and vast editions, have altered this, and now a news ink varnish is made by dissolving rosin in a mineral oil of good body. This has the merit of being less expensive as well as more suitable for the work. The carbon black used is naturally of a cheaper grade than that employed for the better quality inks, and I am glad to say that some of it is made in this country. Not being a very dense black it is necessary to blend it with a small proportion of oil-soluble blue dye, which is also a British product. Before this came into general use it was customary either to use no blue at all or to add prussian blue to the black, but it was found that this did not produce such a clean working ink for printing the numerous half-tone illustrations which are now a prominent feature of most newspapers.

Coloured Letterpress Inks.

Coloured letterpress inks next claim our attention. The present generation has become so accustomed to inks made from lake pigments of aniline origin that it is difficult to imagine how our predecessors got on without them. Fortunately they arrived about the same time that photography gave us the process block. The need for impalpably fine colours did not make itself felt while letterpress printers were working from type and line blocks. For these, mineral and earth colours such as vermilion, ultramarine, indian red, prussian blue, chrome yellow, chrome green, umber and sienna, etc., were quite efficient. If tried to-day on screen blocks of 150 or 175 lines to the inch their shortcomings would soon be apparent even on a "run" of moderate length. But apart from their want of "fineness," there are some, such as ultramarine, which have a chemical action on copper plates and are therefore barred for process printing.

The earlier aniline dyes were very fugitive, and this disadvantage delayed their general adoption, and caused colour makers to precipitate their dyes on coloured mineral pigments so that when the dye faded there was always a substratum of the dull, but fast colour visible. As new dyes arrived which were faster to light the coloured bases were discarded, and now all the best colours

are made by striking the aniline dye on a white base of hydrate of alumina.

Printing inks made with alumina lakes, as they are called, are transparent colours, by which you will understand that when two or more colours are superimposed the influence of the one underneath will show through the colour printed above it. In some cases it is not desirable that inks should be transparent or even semi-transparent, and cover inks will come to your minds as an example. As most covers are of a dark tone, it is necessary that the inks should be as opaque as possible so that the type may stand out clearly with a minimum of printings. If a particular shade is required that cannot be supplied in an opaque quality, it is sometimes advisable to print a flake white as a foundation to "hold up," as it were, the subsequent semi-transparent ink. Bookbinder's cloth inks are another example of the necessity for opaque pigments to avoid double printing. They differ, however, from cover inks, in that they are not made with the usual linseed oil varnish, but contain a percentage of gum and some powerful gloss driers.

Among other letterpress inks which are not ground in the orthodox vehicle I must mention copyable and cheque printing inks. These are similar, though not identical. To fulfil their purpose, copyable inks must be absolutely free from oil, and even the rollers, though new, should be washed to rid them from the smallest trace of grease. Both inks are made with glycerine of standard 1260 specific gravity, but as this has the property of absorbing moisture from the air, it will very soon deteriorate to a gravity of 1250 or 1240. This drawback, which would spoil the working body of the ink, has to be counteracted by the introduction of a syrup which has the opposite tendency. Similar dyes are used in both inks, but while copyable colours are required to be strong and to make several clear copies, the first consideration with cheque inks is that the dyes chosen shall be as sensitive as possible to the wiles of the would-be forger.

Poster Inks.

Letterpress poster inks come next on my list. These bulk somewhat largely in the sum total of coloured inks, but substantially they vary but little from the cheaper jobbing inks. Obviously they should not be affected by rain or sunshine during a given period. Unfortunately this group of inks is the subject of severe competition, and this accounts for some of our bills looking very sadly after a week of summer weather. Red is the colour most affected, as the cheapest of blues, yellows and greens will withstand considerable exposure. There are plenty of para and lithol reds at a reasonable figure, which are fast to light, but those buyers who require their reds at the same price as the cheapest poster yellow must take the risk of their fading at an early date. Some printers who attract business by the durability of their work actually print their posters in genuine madder, which will, of course, retain its colour as long as the poster hangs together.

Process Inks.

Process inks are another important group which come under the first heading. Half-tone black is made in many qualities, and on the best work only a very thin layer of ink is transferred to the paper. It is, therefore, necessary not only that the finest carbons should be used, but that these should be blended with the best bronze blue and purple lake to give the maximum density to illustrations produced in this way.

Considerable skill is required in making this type of ink, as there must be sufficient tackiness to permit the ink to "lift clean" from the block at each impression, but not enough to "pluck" the face of the art paper on which such inks are frequently printed. The drying properties of half-tone inks also require careful adjustment, as those printers who do not "wash up" their machines at night do not expect the ink to dry on the table and rollers, although they require it to adhere to their paper without "setoff." In my opinion more experience is required to make successfully a full range of black inks than to produce a similar number of the coloured variety.

Three-colour Inks.

Three-colour inks are, to many, the most interesting of all the colours, and every year finds a larger number of craftsmen working with them. The shades of yellow, red and blue indicated by the spectrum and recommended by the photographic filter makers, cannot be exactly matched in pigment form, and those which are nearly correct are not as permanent as could be wished. The operation of this method of printing, therefore, rests on a compromise so far as the inks are concerned. For book printing and other work which is not exposed to sunlight, the fugitive set is extensively used as it gives brilliant effects as well as good blacks in the shadows. For prints that will be subjected to a good deal of sun, the best madder is used in the red, and a fine milori blue for the third working. The yellow does not present any difficulty. The compromise series, as one might term it, is the most largely used, as it is fairly brilliant and has good fastness to light for a considerable period. The red in this case is a blend of the blue shade eosine and fast geranium, while the blue is of the chinese variety with the addition of a little aniline turquoise.

Even though the yellow does not present difficulties as to fastness, opinions as to the nature of this colour are not unanimous. In this country most printers work the yellow first as a semi-opaque ink, while on the Continent some firms buy a transparent yellow and print it last. Although a majority of craftsmen think our order of printing the best, one of the disadvantages attributed to it is that, being a very pale colour, it is not always possible to gauge the quantity of yellow to be carried to match exactly the completed picture. The red, being a deeper hue, is more easily judged, and if the yellow is printed last, the first impressions of the third working will clearly show the correct quantity to be run.

The drying properties of trichromatic inks are an important feature, but printers are by no means agreed on a standard. It is generally admitted that each colour should be almost but not quite dry when the next is imposed. Some firms who have a quantity of regular work, run three machines on one job. As soon as a couple of reams of yellow are finished on No. 1 machine, the pile is transferred to No. 2 for the red working, and an hour later these sheets are fed into the third machine which is printing the blue. In this way a supply of finished work is available at midday.

This system necessitates using quicker drying inks than are usually asked for. The result, however, may be excellent and certainly better than those obtained from tandem or simultaneous printing, where the colours are practically wet when superimposed. Most three-colour printers prefer their trichromatic inks to be slow in drying, so that if it should be necessary to postpone the imposition of the second and third colours for a day or two there is no difficulty about getting the ink to pick up after the interval. In the event of a rush job coming along, driers can be added, but they cannot be taken away or counteracted without spoiling the ink.

Two-colour and Double-tone.

Two-colour letterpress inks are not extensively used, but there are signs that the demand will increase. The guiding principle in choosing a pair of colours is to see that as far as possible the shades of the three primaries are shared by the two substitute colours. A combination of yellow and blue with some red added to each gives orange and purple, which, with the addition of a touch of black to the darker colour, are probably as good a pair of inks as it is possible to arrange for most subjects.

Double-tone inks are the last group of letterpress inks I propose to refer to. If ever there was an ink that an ink maker wished had never been invented, it is the double-tone process ink. I think it is generally known that it is made with a stable half-tone ink of good quality plus a small quantity of fugitive oil soluble dye. Such an ink has been likened to the English weather: it is uncertain in its behaviour. The effect of introducing this dye is to create a thin circle or halo of a light colour round each dark half-tone dot and thereby give every print the appearance of a double printing.

The cause of most of the trouble arising from its use is due to the fact that different papers develop the halo in varying degrees, and a printer executing repeat orders on fresh deliveries of paper can never be sure that he is going to obtain the same effect that he had before. Then again, the appearance of a print may vary from time to time. The maximum effect is not developed until a day or two after it has been printed, but it has a tendency to decline or become more subdued as time goes on. Other mishaps arise through the occasional use of too thin a paper or the introduction of too much dye, causing the ink to show through or set off on the next sheet. A coated postcard of good quality will stand a larger proportion of double-tone dye than an imitation art or super-calendered paper, and disappointments often occur through a printer buying his ink for one purpose and using some of it for another. The remedy, therefore, when buying double-tone inks is to attach to the order a piece of the paper on which it is proposed to print.

Lithographic Inks.

My second heading refers to inks required for printing from a level surface. This, of course, includes lithography in all its branches.

Lithographic inks are not vastly different from those supplied for letterpress printing. They are stouter in body, having a larger proportion of pigment ground into a stiffer varnish; they are consequently harder to grind and incidentally cost more money. There are certain pigments such as earth colours which cannot be used for half-tone printing, but which are extensively employed on stone. On the other hand, there are several colours which are good for letterpress printing, such as the eosine family, which are not recommended for lithographic work as they are inclined to run in water.

Most lithographers require their ink to be very stiff, stiffer in fact than the operator can use them, as it is a long-standing custom with many men to reduce their ink themselves. I do not know why this should be so, as in Canada, where a number of old English craftsmen are still at work, it is usual for litho inks to be supplied ready for use, and if an ink is sent out with too stiff a body, it is likely to be returned to be reconditioned.

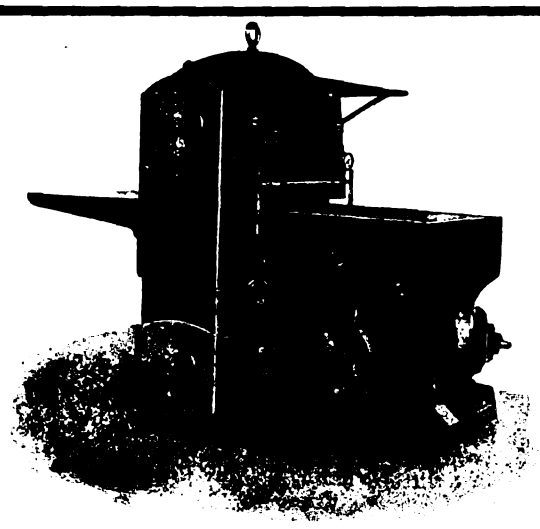
In offset lithography two additional facts have to be remembered. One is that, as the rubber blanket picks up and transfers very little ink to the paper, ink must be as concentrated as possible to avoid a washy appearance in the print. Secondly, it must not contain any ingredient which will adversely affect the surface of the rubber.

In printing on tin the above facts have also to be remembered, and in addition the colours must stand a stoving temperature of 140 deg. to 160 deg. F. for several hours, without discolouration or any tendency to crack when the tins are bent into shape.

Collotype and Intaglio.

The only other form of surface printing I want to mention is the collotype process. This is a method of printing from a smooth gelatinised surface which produces very beautiful results. The inks used are a modified form of lithographic ink, and while the quality must be good, it is of even more importance that the room in which the work is done should be of a warm, dry, even temperature both night and day.

The third and last heading deals with inks for use on intaglio or hollowed out surfaces. The simplest example of this kind of printing is the ordinary visiting card, and one of the most important the Government Ordnance maps and charts. Both are printed from engraved plates, and the black ink made for this work is known as a "short" ink as compared with the tacky variety needed for printing from half-tones.



Copperplate black looks black when it is printed because of the depth of ink picked up from the crevices in the plate and deposited on the paper, but in reality it is one of the least dense of all inks, being largely made from frankfort black which is (or perhaps I should say, used to be) made from burnt vine stalks. It is only necessary to place a piece of frankfort carbon by the side of a sample of the best gas black to see that the former is really greyish in comparison.

The two important points to remember in making a copperplate ink are that it shall lift properly from the engraved portions when pressed against the paper, and shall wipe perfectly clean from the burnished surface of the plate.

Intaglio printing from engraved copper cylinders requires an entirely different type of ink. The "doctor" or steel "wipe," which cleans the printing cylinder at each revolution, requires the ink to be as soft as possible to obviate scratching or wearing

(Continued on page 80).

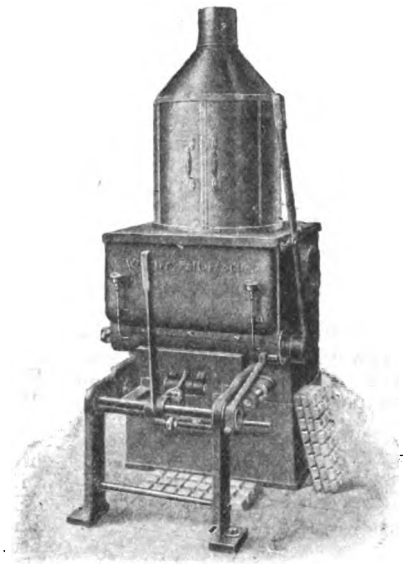
"WINKLER" Automatic Moulding & Drying Press

FOR FINE ART AND NEWSPAPER MOULDS



Dry and/or Wet Flong, Hot or Cold, with Electric or Steam Heating.

Equals in capacity THREE Pneumatic Presses.
The Matrix is moulded and dried in one operation, the drying taking place under reduced pressure (patent).
The Moisture is extracted by a suction pump.
Automatic Temperature Control and Time Switch.

℄ Produces, in conjunction with Light's "Photo Tone" Fine Art Flong, Half Tone Matrices of finest screen so accurate that Stereos cast therefrom are facsimile to originals.

℄ Perfectly even pressure throughout the surface of the platen is absolutely guaranteed, in contradistinction to all stereo presses operated pneumatically, hydraulically, or by hand power, which have centrally actuated platens inevitably more or less deficient in equality of pressure.

℄ Saves Type, Time, Labour, Power and Fuel.

The "WINKLER" Automatic Ingot Caster

will substantially cut down your loss in dross and your bill for renovating metal.

The Metal is Drawn from Bottom of Pot, which is directly connected with the ingot moulds. Consequently only the clean metal is cast under the weight of the metal in the pot.

The Surface of the Metal is Kept in a Non-Oxidizing Atmosphere, which prevents the formation of dross.

No Unhealthy Fumes from the Metal, these being carried off through the flue.

Automatic Metal Mixing. When the metal flows into the moulds the air escapes through the metal in the pot, thereby acting as a natural stirrer.

"Surface Combustion" Gas Burners, giving uniform furnace temperature and minimum gas consumption. Radiant heating from refractory bed on which correct mixture of air and gas burns completely.

Buy British at the B.I.F. Birmingham

The products of Britain's best brains and machinery, the outcome of Britain's years of commercial experience are concentrated at the B.I.F., Birmingham. If, therefore, you buy British goods—here is your market; here are the goods you require, the firms who can best serve you. During a visit to the B.I.F., you can crowd a month's work into an hour—by personal contact with the men who make the goods you buy. Make a note *now* to visit——

THE BRITISH INDUSTRIES FAIR

Birmingham, Feb. 16 to 27, 1925.

Buyers with interests in widely differing classes of goods may see them *all* in one visit to Birmingham.

The schedule of exhibits includes—

Paper; Stationery and Stationers' Sundries and Office Appliances; Printing; Books; Fancy Goods; Leather Goods; Toys and Games; Sports Goods, etc.

Write for full information regarding the B.I.F. to

Trade Notes.

MESSRS. W. AND A. K. JOHNSTON, of Edinburgh, have removed their London office and showroom to Holborn Hall, 34, Gray's Inn-road, W.C.1, where they are showing a full set of maps and text books.

THE Premier Linotyping and Printing Co., Ltd., late of 5-9, Hosier-lane, E.C.1, have just removed to more commodious premises at 21-26, Dean-street, Fetter-lane, E.C.4.

FORTY London publishing firms are co-operating in an interesting new enterprise, in which a big caravan-like motor-van is to travel the latest books round the country.

MESSRS. F. HEWITT AND SON, LTD., proprietors of the *Leicester Mercury* and associated newspapers, are about to erect new and substantial premises in the centre of Leicester. Mr. Leicester Hewitt is at present touring various parts of the world for the purpose of incorporating the most modern ideas and equipment into the new buildings.

THE *Daily Chronicle* Northern edition was issued on Monday from Leeds. Elaborate publicity arrangements had been carried out prior to the issue, special posters of varying size being displayed throughout the area of circulation. There are rumours of similar projects on the part of other London newspapers, several towns in the North being mentioned as likely centres for duplicate printing.

"G. K.'s WEEKLY."—Particulars were published on Tuesday of the issue to the public of 10,000 7 per cent. participating shares of £1 each of *G. K.'s Weekly*. The company has been formed to establish and publish a new popular review of politics, literature and art, with a definite democratic programme. The directors are Mr. G. K. Chesterton, Major the Hon. Maurice Baring, Mr. Cedric Chivers, J.P., Lord Howard De Walden and Mr. Maurice Benington Reckitt.

THE proprietors of the *Manchester Guardian* have inaugurated a staff pension scheme, under which all employees on reaching the age of 65 will, if there have been 30 years' service with the firm, be given an allowance of 30s. per week. No pension will be given for less than 15 years' service, and for service between 15 and 30 years proportionate allowances will be made. The scheme is non-contributory.

THE East Sussex County Council has under consideration several summonses for the erection of hoardings and the exhibition of advertisements. The summonses are the first to be issued under a by-law passed by the County Council in 1912, under the Advertisement Acts.

BOLTON Master Printers' Association held a very successful dinner on Wednesday of last week at the Pack Horse Hotel, Bolton. A pleasant innovation was the presence of ladies, and there was an excellent attendance, amongst those present being Mr. H. A. Bethell (Federation executive), Mr. J. S. Brunton (president, Lancashire and Cheshire Alliance), Mr. W. Geo. White (Alliance secretary) and Mr. F. Waterhouse (president, Bolton Association).

A VERY good start has been made by the Wrexham District Committee of the Joint Industrial Council, the first meeting of which took place on Friday at the Y.M.C.A. premises, Wrexham. There was a most representative gathering of both employers and workpeople, and amongst those taking part were Mr. H. A. Bethell (chairman, Organisation Committee), and Mr. A. E. Goodwin (joint secretary).

THE annual meeting of the Northern District of the Newspaper Press Fund was held on Saturday night in the *Chronicle* Office, Newcastle. The annual report submitted by the District Secretary (Mr. Thomas Greene), stated that during the past year there had been distributed by the Fund a sum of £13,681 of which £9,574 has been granted to members, £1,161 to non-members, and £3,126 paid in pensions. The total represented an increase of just over £2,000 on the preceding year. The grants numbered about 500, and there were 52 pensions current.

THERE was a very large attendance of friends, business colleagues and employees at a service held at the City Temple on Tuesday in memory of Mr. Herbert Clarke, chairman of Messrs. W. Speaight and Sons, Ltd. The London Master Printers' Association was represented by Mr. Alfred Langley (president), Mr. Edward Unwin and Mr. W. F. Willsher. The service was conducted by Rev. John A. Hutton, M.A., D.D.

MR. WILLIAM G. WATSON, editor of the *Stafford Chronicle* died on Saturday, aged 69 years.

MR. CHARLES SHERIDAN JONES, author and Fleet-street journalist has died at Ashdon, Essex, at the age of 49. He was for a time editor of the *Daily Herald*, and with Mr. Cecil Chesterton started the *New Witness*.

THE *Publishing World*—a monthly Review of Publishing, Journalism and Advertising—has just published its first number. Attractively produced, the journal is printed by H. R. Grubb, Ltd., Croydon.

THE first issue has appeared of a monthly magazine, the *Conservative Review*, printed and published by the Peterborough Press, Ltd.

A NEW 1s. monthly made its first appearance on Friday—the *Wireless Magazine*, published by Cassells and edited by Mr. Bernard P. Jones.

THE Chingford branch of the Independent Labour Party has issued the first copy of a little monthly news sheet, called the *Chingford Advertiser and Labour News*, which is distributed free.

THE annual dinner of the companionship of the *Birmingham Post* was held at Birmingham on Saturday. Mr. H. A. Spring, father of the chapel, presided, and the guests included Sir Charles Hyde, the proprietor, and Mr. G. W. Hubbard, editor of the *Birmingham Post*. Mr. Spring proposed the toast of the paper, to which Sir Charles Hyde replied, and Mr. F. Booth, overseer, and Mr. F. W. Rutter, clerk of the chapel, also spoke.

THE Whitehall Printeries (Messrs Petty and Son), Leeds, Football Club were defeated by the odd goal in the English Amateur Cup ties.

Trade Union Matters.

NOTICE FOR WAGES REDUCTION.—The solicitors to the Typographical Association have given the following opinion concerning the case of three members whose wages had been reduced to the 'stab rate without any notice being given by the firm: "The terms of service of the three members cannot be varied without 14 days' prior notice, and under those circumstances they are entitled to claim the difference between 'stab rate and the rate of wages they were receiving prior to the reduction for the last three weeks of their employment." The Executive Council have forwarded a copy of the letter to the branch concerned, with the intimation that if the difference is not paid by the firm legal proceedings for recovery should be taken.

AN APPRENTICE POINT.—The secretary of the Watford branch of the Typographical Association has reported that a difficulty has arisen in an office in regard to apprentices. The firm in question desired to divide their machine department into three sections and to have apprentices for each section. Under this arrangement the firm would be entitled to four extra apprentices. The Executive Council of the Association, after consideration of the matter, appointed a delegate to visit the branch and interview the firm on the subject.

NATIONAL UNION OF JOURNALISTS.—At the annual meeting of the Leeds Branch of the National Union of Journalists at Leeds, on Saturday, it was reported that the membership had increased from 129 to 145 during the year. Contributions had been higher, and the year finished with a balance of £14 14s. Cash value or help to needy members during the year amounted to £200.

THE *British and Colonial Printer and Stationer* circulates all over the world.

Costing & Estimating Examinations

The following are the results of the Costing and Estimating examinations held at Stationers' Hall on December 15th, 1924. These examinations are arranged by the Stationers' Company and Printing Industry Technical Board, and the examiners are Mr. W. Howard Hazell, J.P., vice-president of the Master Printers' Federation (Costing) and Mr. Alfred Langley, president of the London Master Printers' Association (Estimating).

Costing.

The Printing Crafts Guild.

The large hall of the College of Technology, Manchester, was a pleasant sight to behold on the occasion of the January Whist Drive and Fancy Dress Carnival, under the presidency of Mr. John Taylor, who had the support of over 250 ladies and gentlemen.

Miss E. Toombs as "Peter Pan" and Mr. S. Bowden as "The Sheik of Araby" secured the prizes for fancy dress.

Some of the prize-winners at cards were: Mrs. B. Sutton, Miss L. Woolley, Miss M. Wilson, Mrs. Edgar and Mr. S. M. Colton.

During the evening Mr. Bertram Sutton's Orchestra proved exceedingly popular and the inimitable Mr. W. M. Menzies was the M.C. for the evening.

Part of the proceeds is being devoted to charities.

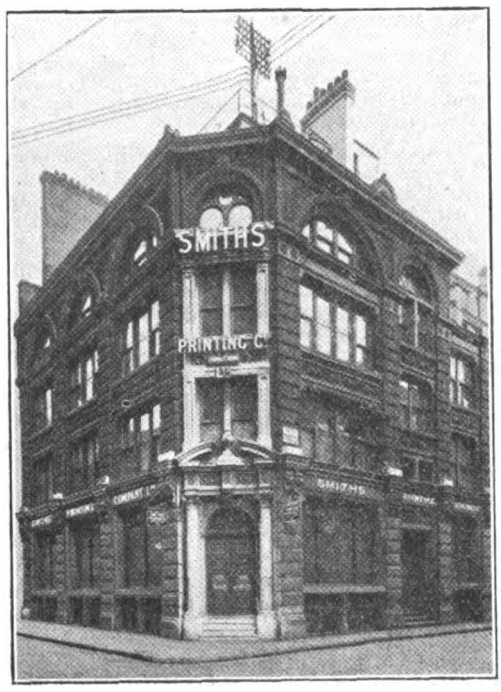
WEE MAC.

Openings for British Trade, etc.

Inquiries have been received by the Department of Overseas Trade (Development and Intelligence), 35, Old Queen-street, London, S.W.1, to whom further inquiries should be addressed with the reference number quoted.

EGYPT.

A firm of commission agents established in Cairo desires to obtain agencies on a commission basis or on their own account for British manufactures of stationery, etc. (Reference No. 80.)



The Commercial Secretary at Cairo reports that the Ministry of Finance, Egypt, invite tenders to be presented by noon on February 2nd, 1925, for the supply of paper, stationery and various other allied goods required by the Central Stationery Stores Department during the year 1925-6. (Reference No. B.X. 1484.)

A Progressive Printing House.

Smiths' Printing Co. (London and St. Albans), Ltd.

Even though they may be familiar with the name and the Fetter-lane premises of Smiths' Printing Co., probably some of those associated with the printing and allied trades of London are unaware of the real extent and capabilities of this important printing house.

Dating its beginnings to as far back as 1891, the business was first the printing department of Smiths' Advertising Agency, in Racquet-court; but it developed rapidly, and its growth eventually made possible the acquisition and

The Fetter Lane Premises.

special fitting-out of the works at Fetter-lane on a fine corner site readily accessible from Fleet-street. The various departments, besides being wisely correlated, are well equipped with machinery to meet up-to-date requirements. The composing-room accommodates a large staff of compositors, who appear to have more than usual facilities in the way of supplies, with well-equipped cabinets, racks, composing surfaces and the other necessities for quick and efficient composition. Machine composing also is well provided for, as the equipment includes comprehensive batteries of Linotype and Lanston Monotype machines. The press-rooms, electric motor driven, with separate control of each individual machine, represent a high state of efficiency, a wide range of work being negotiable on the numerous machines, which include Miehles, Optimus presses, Dawsons, Colts and Falcons. A large and well-equipped bindery is another important section, and amongst subsidiary departments may be mentioned a commodious and well stocked paper warehouse.

The leading spirit of the concern is Mr. Arthur W. Hall, who has been associated with the business since its inception. Mr. Hall, by the way, is an enthusiastic amateur gardener and his possession of technical knowledge in the horticultural line has led to a good deal of publicity matter in the realm of flower and fruit being entrusted to his firm for production. Such work includes excellent three-colour printing in the way of catalogues, booklets, etc. The company is well able to undertake long runs of magazine, pamphlet, catalogue or label printing, as well as general commercial lines. Mono and Lino setting for the trade is a branch that may be mentioned as a speciality, whilst special arrangements are made to facilitate the execution of "rush" orders.

Many printers who know the extensive resources of this printing house find in Smiths' Printing Co. a valuable auxiliary to their own businesses. Some well-known printing firms have utilised this auxiliary service for over thirty years, and to-day printers who find themselves in difficulties because of the nature or the extent of orders received, are continually becoming new clients of this up-to-date and progressive house.

Indian Import Duties.

A notification of the Government of India, dated December 20th, contains revised valuations for use in assessing the import and export duties leviable in India, with effect from January 1st.

A duty of 2½ per cent. *ad val.* appears against the following entry: Printing and lithographic material, namely, presses, type, ink, aluminium lithographic plates, brass rules, composing sticks, chases, imposing tables, and lithographic stones, stereo blocks, wood blocks, half-tone blocks, electrotype blocks, roller moulds, roller frames and stocks, roller composition, standing screw and hot presses, perforating machines, gold blocking presses, galley presses, proof presses, arming presses, copper plate printing presses, rolling presses, ruling machines, ruling pen making machines, lead and rule cutters, type casting machines, type setting and casting machines, rule bending machines, rule mitreing machines, bronzing machines, leads, wooden and metal quoins, shooting sticks and galleys, stereotyping apparatus, metal furniture, paper folding machines, and paging machines, but excluding paper.

In the case of prints, engravings and pictures, including photographs and picture post cards, the duty is 30 per cent. *ad val.*

The duty in all the items under the heading of paper, pasteboard and stationery is 15 per cent. and the tariff valuations are as follows:

Paper and articles made of paper and paper mache, pasteboard, millboard, and cardboard, all sorts, and stationery, including ruled or printed forms, and account and manuscript books, drawing and copy books, labels, advertising circulars, sheet or card almanacs and calendars, Christmas, Easter, and other cards, including cards in booklet form, including also wastepaper and old newspapers for packing, except old newspapers in bales and bags, but excluding trade catalogues and advertising circulars imported by packet, book, or parcel post, and also excluding the descriptions following: *Ad valorem.*

Old newspaper in bales and bags, per cwt., 6Rs. 8a.

News printing paper, glazed and unglazed—white or grey, per lb., 2a. 3p.; coloured, per lb., 2a. 6p.

Printing paper, white or coloured—real art, per lb., 6a. 6p.; imitation art, machine finish, super-calendered, ivory finish, antique, stereo, litho, poster, cartridge (other than drawing or photographic cartridge), and cover paper, per lb., 4a.; other sorts, *ad valorem.*

Packing and wrapping paper—nature brown, and machine glazed pressings and machine-glazed wrappings, per lb., 2a. 3p.; manilla, machine-glazed or unglazed, and sulphite envelope, per lb., 2a. 9p; kraft and imitation kraft, per lb., 3a. 3p.; other sorts, including tissues, *ad valorem.*

Writing paper—bond or bank, glazed and unglazed, per lb., 6a. 6p.; creamlaid, other than mechanical, per lb., 4a. 6p.; mechanical creamlaid, per lb., 4a. 0p.; other sorts, *ad valorem.*

Strawboards, per cwt., 8Rs.

Trade catalogues and advertising circulars imported by packet, book, or parcel post are free.

Under the heading of miscellaneous appears china clay, the tariff valuation for which is 85Rs. per ton, and the duty 15 per cent.

MESSRS. W. S. MUIR AND CO., LTD., in addition to representing Neusser Mill, who specialise in vegetable parchment, bleached greaseproof and tracing papers, do a very considerable business in glazed transparents, unbleached, silverwhite, bleached and a wide range of colours, reels and flat, plain and embossed. Samples of these white and coloured glazed transparents, representing a speciality of the firm, are included in the calendar issued with the new year. Messrs. W. S. Muir are now representing Messrs. Weka Tuchpapier A.G., A. u. K. Rommler, Prinzessinnenstrasse 16, Berlin, S. 42, who specialise in the making of flock and suede papers. The latter is entirely a new article—a soft finished flock paper, which takes the place of chrome leather. The papers are guaranteed fast-coated, and will not crack. We understand that this company are the only people in the world who make these suede papers, which should prove invaluable where high-class fancy articles are required.

Digitized by Google

Lithographers' Auxiliary Concert.

A good musical programme, combined with a desire to assist a very worthy object, attracted a large gathering to the Cannon-street Hotel on Friday, when the second concert of the season was given by the Lithographers' Auxiliary under the chairmanship of Mr. Stanley E. Wynne (of the firm of Wynne and Selby, Ltd.). From a financial point of view the event also proved very successful, the efforts of the chairman and the collection during the evening representing the handsome sum of £185. Among those present were Major D. V. Anderson, Messrs. J. E. Reeve, W. Wynne, J. A. J. Mackenzie, E. A. Lowe, Woodgate Stevens, E. A. Mullins, W. Herring, H. F. Parker and J. Mynott (Auxiliary secretary).

During an interval in the programme the chairman took the opportunity of referring in a short speech to the excellent work of the Printers' Pension Corporation. He believed all those present were connected directly or indirectly with the printing industry, and he was quite certain they were all agreed that the Corporation was particularly deserving of their support and interest.

Mr. E. A. Lowe (chairman, Auxiliary committee), in proposing a vote of thanks to the chairman, congratulated Mr. Wynne on the splendid success of his efforts. The sum he had succeeded in collecting indicated a large-hearted generosity, and was considerably in excess of the anticipations of the committee.

The vote of thanks was very heartily accorded, and musical honours were given.

The chairman, in returning thanks, mentioned with gratitude the assistance he had received from a number of friends in the industry.

The Artistes.

Mr. W. Herring once again showed much ability as an organiser, the musical programme being much appreciated both from the point of view of diversity and quality. Perhaps the outstanding feature of the programme was the appearance of that old-time music hall favourite, Mr. Charles Coborn. Mr. Coborn—who reaches his 73rd birthday this year—gave an interesting account of his recent walking tours, and then, in response to an insistent appeal from the audience, delighted his hearers with "The Man that Broke the Bank at Monte Carlo" and the chorus of "Two Lovely Black Eyes" sung in about ten different foreign languages. Miss Georgina Hibberd was much appreciated in the singing of several contralto songs, whilst Miss Lilian Reeve and Mr. Leonard Dove were no less successful with several humorous duets. Miss Dorrie Courtney (with Mr. Reginald A. Nevill, L.R.A.M. at the piano) gave some excellent zither-banjo selections, her finger-playing being particularly pleasing. Mr. Philip Merritt (tenor) and Mr. Dick Lee (humorous) also met much well-merited appreciation. Miss Helen George, L.L.C.M., acted as accompanist, and as usual was quite equal to all demands made upon her skill.

The National Anthem brought a successful evening to a close.

East Anglian Printers' Readers.

A quarterly meeting of the East Anglia District, Provincial Guild of Printers' Readers, was held at the Chaucer Institute, Bungay, on Saturday, with the president (Mr. A. W. Daynes, Norwich), in the chair. There was a good attendance of members from Norwich, Beccles, and local printing houses. The secretary (Mr. W. E. Cooper) briefly dealt with matters arising from headquarters' activity, and the treasurer (Mr. A. A. Oliver) presented the balance-sheet, which showed a satisfactory financial position. Mr. J. Hancy (Bungay) read a paper "On Words," which proved acceptable by its comprehensiveness in dealing with the beauties of English phraseology, various word formations receiving alternative presentments with striking effect. Discussion followed, and Mr. J. Hancy received hearty thanks. It was agreed to hold the next meeting at Norwich in April. At the close of business visitors were entertained at tea by the Chaucer Press readers' chapel.

The "co-efficient of increase" applicable to playing cards imported into French West Africa during the first half of 1925 is 2.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies,
Machinery for Sale and Wanted,
Businesses for Sale and Wanted,
Partnerships and Investments,
Miscellaneous.

One Insertion 3/0
Three Insertions 6/0
For every line exceeding three lines **6d.**

Situations Wanted.

Under this heading operatives are granted a Special Rate for a minimum of three lines (twenty-one words):—

One Insertion 1/6
Three Insertions 3/0
For every line exceeding three lines **6d**

THURSDAY, JANUARY 29, 1925.

Allied Trades Employment.

SOME interesting figures concerning conditions and wages in the allied trades, particularly with respect to the effect of trade disputes on employment, are included in a review of the year 1924 issued by the Ministry of Labour. Generally they indicate progress towards stabilisation. Employment in paper manufacture was moderate throughout 1924. In the printing trade employment was slack in January and February, but subsequently improved and towards the end of the year it was fairly good; with bookbinders it was moderate from January to August, but improved in September and was fair during the remainder of the year. A table of changes in rates and wages shows that in paper, printing, etc., 3,000 workpeople received net increases last year and 1,000 decreases. In 1923, 400 had received increases and 112,500 decreases. With regard to trade disputes, the paper, printing, etc., group are shown to have experienced 12 in 1924. The number of workpeople involved in these disputes was 3,000 and the aggregate duration in working days was 17,000. In 1923 the corresponding figures were—disputes, 15; workpeople involved, 6,000; duration in working days, 171,000.

* * *

Recent Figures.

STATISTICS and reports concerning the printing and allied trades go to show that the movement forward is slow, and in some cases has been checked. But compared with industry generally the position is not without encouragement. An official report concerning the paper trade says that employment during December, although showing a slight improvement in some districts, continued moderate generally. With letterpress printers employment, on the whole, continued fairly good; it was, however, reported to have declined in London, also at Leeds and Bristol, while at Manchester and Glasgow there was an improvement. With electrotypers and stereotypers employment was generally good, and was better than in November in London and Manchester. In the lithographic printing trade employment remained fairly good, and it was fair with lithographic artists in London and Manchester. With bookbinders, employment, on the whole, was fairly good, although there was some decline on the previous month in London. The percentage of unemployed among workpeople covered by the Unemployment Insurance Acts in the printing and bookbinding trades was 5·0 at December 22nd, compared with 5·2 at November 24th and 5·1 at December 21st, 1923. In the paper and paperboard making industry the percentage was 7·7 at December 22nd, compared with 7·3 at November 24th and 8·6 at December 21st, 1923. In the cardboard box, paper bag, and stationery trades the percentage was 6·4 at December 22nd, the same percentage as at November 24th and December 21st, 1923. It is interesting to note that for industry generally the percentage unemployed at December 22nd was 10·9.

* * *

Printers' Paper Stocks.

IF a census of paper stocks could be taken and compared with earlier records, it is as certain as anything can be that there would be revealed a wide margin of tonnage difference. Higher price values and ten years of extreme caution in buying and carrying stocks have combined to make reluctance an ingrained characteristic in the practice of paper buying. However much we may have become acclimatised to post-war prices and values, there is always the incentive with older hands or heads to think in terms of comparative price. There are many paper users who adhere as closely as possible to pre-war conceptions of investment in stock. On the other hand, there are paper users who gave little attention to the amount of stock carried when paper was so cheap, but who have been brought to realise the importance of tying up capital in paper by the effect of overdraft on the returns.

London District Committee, J.I.C.

A number of important matters were discussed at a meeting of the London District Committee of the Joint Industrial Council held on Tuesday.

It was decided to arrange for public meetings to be held in March and April at Stationers' Hall.

The J.I.C. Apprenticeship Scheme was considered, and at the request of the unions the matter was held over for further consideration at the next meeting.

A long discussion took place with regard to a dispute affecting a London house, evidence being put forward both by the L.M.P.A. and the union sides. The Committee eventually adopted a resolution deciding the question of demarcation between porters' and bench hands' work in this particular case, the decision being then communicated to both parties.

The resignation of Sir William Waterlow from the Committee—owing to pressure of public duties—was accepted by the Committee with much regret, expression being made of cordial appreciation of Sir William's assistance in the formation of the Committee and at the meetings which he attended until circumstances prevented his further attendance. It was decided to approach Mr. F. R. Muir (vice-president, L.M.P.A.), with an invitation to fill the vacancy.

A decision was reached to raise at the annual meeting of the Committee in May the question of a possible increase in the subscription, in order to allow of an extension of the Committee's activities in the direction of public meetings, which have proved very successful.

The New Monotype Chief.

Mr. W. I. Burch.

The announcement that Mr. W. I. Burch has been appointed managing director of the Lanston Monotype Corporation, Ltd. (in succession to the late Mr. H. M. Duncan), scarcely seems to be an item of news, as Mr. Burch has lately been so largely fulfilling the function of the office to which he is now officially promoted. We think, however, that we shall be expressing the sentiment of the printing industry as well as our own when we congratulate Mr. Burch on his appointment and wish him many more years in which his outstanding abilities will be utilised for the benefit of the important concern he represents and for the good of the trade as a whole.

No one except the late managing director has been identified in closer degree than Mr. Burch with the fortunes of the Monotype

Mr. W. I. Burch.

composing machine since its first introduction into this country. The Lanston Monotype Corporation, Ltd., was registered in December, 1897, and, after possessing for only a few weeks a nominal secretary, the Corporation got its first real secretary when Mr. Burch was appointed to the position in March, 1898. For the twenty-seven years since that date Mr. Burch has continued to act as secretary, adding in 1917 the additional responsibilities of a directorship. Now, as managing director, he hands over the secretaryship to his assistant, Mr. H. R. Reid.

In a sense, this long occupancy of one office means an uneventful record—though all who know Mr. Burch will realise that his existence has been anything but one of stagnation. In the development of the Lanston Monotype Mr. Burch has played a prominent part since before there was a single Monotype machine in this country, and before the Corporation had any premises of its own. It was under his direction that the Corporation's first premises at 42, Drury-lane, were completed and equipped, and under his direction the personnel of the Corporation was built up. And since that time one associates Mr. Burch with every step forward the Monotype has made—one might almost say every new installation, because Mr. Burch has become notable throughout the trade for the personal interest he has taken in the installing of the Monotype in numerous printing offices all over the country. From the installation in the offices of *The Times*, right down to the equipment of many a small country office, Mr. Burch has been in direct contact with the customers. Thus he is widely known not only for the prominent part he takes in trade movements, such as charities, exhibitions, and the like, but in a more personal manner through the intimate contact of business.

During the War, Mr. Burch was associated with the big task of adapting the resources of the Lanston Monotype Corporation to munition requirements—at a cost of some £100,000—and moreover took command of the 14th County of London Volunteer Battalion. After resigning that command, he was in 1919 re-gazetted honorary Major, in recognition of the services he rendered during the War.

Electrotypers and Stereotypers

MANAGERS & OVERSEERS' ASSOCIATION

Annual Meeting.

There was a full gathering of the members of this Association on the occasion of the annual meeting, which was held on Tuesday of last week at St. Bride Institute, Bride-lane, E.C.4, under the chairmanship of Mr. A. Chadwell (president). From many of the items appearing on the agenda—in the hands of the members—evidences were again shown of the Association's further progress. The income side of the account indicates a healthy condition of the finances, whilst the sum representing donations to charitable and craft education shows the interest the members have shown in the general advancement of the electrotyping and stereotyping section of the industry. During the year the sum voted for these objects amounted approximately to £50, no mean figure for so comparatively small an organisation. In addition to the earnest consideration given to questions outside their own immediate concern, the members during the year have taken full advantage of the friendship and mutual help afforded by the monthly gatheriugs.

The minutes of the previous meeting having been read and confirmed, the meeting at once proceeded to the election of a president for the forthcoming year.

Mr. J. Parker, in proposing the re-election of Mr. A. Chadwell to the position, said he was confident the Association could not do better than again place the responsibilities of the presidency in Mr. Chadwell's hands.

Mr. J. S. Sunderland seconded the proposition, which was carried unanimously.

Mr. Chadwell, in returning thanks for the honour again reposed in him, said he could not but think that the Association would be better served by someone else. However, he could assure them that whether in office or not his interest in the Association would not alter.

Mr. Chadwell next proposed the re-election of Mr. J. Black as vice-president, which was very heartily agreed to.

The next item on the agenda was the re-election of Mr. W. Bullett as general secretary, an appointment that proved to be a very popular one.

Mr. Bullett briefly thanked the members for the confidence they had again placed in him.

Mr. W. Longley, who has held the position of treasurer practically since the inception of the Association in 1899, was again selected for this post.

Other positions filled were the following:—Trustees, Messrs. G. W. Sharvell, F. LeGrys; council, Messrs. Craske, W. Crosby, W. M. Forsyth, H. Filkins, J. Parker, G. W. C. Sharvell and A. Wood.

Mr. Chadwell, in inviting criticism or remarks on the annual balance-sheet, congratulated the secretary and treasurer on the general stability of the Association's finances. He expressed the view that in spite of the rather substantial sums granted during the year to members in necessitous circumstances, to technical education and other purposes, the balance-sheet bore evidences of a healthy state of affairs.

Whilst there was no real criticism of the expenditure incurred during the year, one or two speakers drew attention to the necessity for the executive keeping a close watch over the Association's spending, it being pointed out that none of them knew what demands the funds might at any time in the future be called upon to face.

Mr. J. Miller, in moving the adoption of the balance-sheet, remarked on its satisfactory character.

Mr. J. Parker seconded the motion, which was carried *nem. con.*

Mr. Chadwell then made an appeal for support for the annual informal members' dinner to be held at "Ye Olde London," Ludgate-hill, on February 9th (6.30 p.m.), at which Mr. J. Parker was to occupy the chair.

The chairman next informed the meeting of the serious illness of one of their greatly respected members, Mr. H. Clark, to whom the secretary was instructed to convey the members' sympathy and wishes for a speedy recovery.

The secretary announced that the next meeting of the Association would be held at the Society offices, 80, Blackfriars-road, when an address would be given by Mr. W. C. Warren on the new apparatus designed to prevent lead poisoning in the foundry. Mr. Warren, he said, had expressed a wish for a large attendance, and had extended an invitation to be present to any friends of the members interested.

In reply to a question by the chairman, Mr. J. S. Sunderland, electrotyping and stereotyping instructor at the London Printing School, stated that the attendance of students during the present session was considerably better than during the preceding one. Mr. Sunderland also made an appeal for the co-operation of the members in the matter of the training of the lads in their respective foundries.

Several speakers referred to the improvement they had noticed in the boys attending the classes under Mr. Sunderland.

A number of copies of an account of Mr. J. R. Riddell's recent visit to the Continent were distributed to the members before retiring.

A vote of thanks to the chairman brought the meeting to a close.

From the London Gazette.

CAMPBELL AND PRICE, LTD. (paper agents, manufacturers and dealers, etc., London).—First mortgage debenture dated December 31st, 1924, to secure £4,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: C. H. Hawkins and A. C. Grigg, 121-5, Oxford-street, W.1.

RECEIVER APPOINTED OR RELEASED.

FRENKELS, LTD. (advertising contractors London).—A. R. K. Farlow, of 50, Gresham-street, E.C., was appointed receiver on January 16th, 1925, under powers contained in debentures dated November 11th, 1924.

BANKRUPTCIES, etc.

Re MORRIS SUSMAN, Printer and Stationer, 90, New-road, Whitechapel.—The public examination of this debtor was held on January 23rd before Mr. Registrar Mellor at the London Bankruptcy Court, the accounts showing liabilities £1,561 and assets "bad book debt £50." In reply to Mr. V. Armstrong, official receiver, the debtor stated that he came from Russia in 1905 and had not been naturalised in this country. During the following year he commenced business in New-road as a bookseller and publisher, and it was successful until June, 1911, when he transferred it to his wife on their marriage. The business was thereafter carried on under the style of "Susman Electric Printing" (proprietor, Celia Susman), and witness acted as manager. He attributed his failure to

Digitized by Google

losses and liabilities incurred in connection with a Picture Palace at Leytonstone, which he and another person jointly purchased in 1918, and to losses over a theatrical company. The examination was concluded.

Re KARL GUSTAV HERMAN BERLIN, paper agent and merchant, 3, Lawrence Pountney-hill, E.C.—The public examination was held at the London Bankruptcy Court on January 21st before Mr. Registrar Hope. The debtor failed last August with liabilities of £5,455, against assets valued at £175. Replying to the official receiver, debtor stated that he was a Swedish subject, and carried on business as a timber merchant until 1914. In the following January, with £100 capital, he commenced business as a paper merchant in Gracechurch-street, removing to Lawrence Pountney-lane in October, 1918. A year later he was joined in partnership by another person who put £200 into the business; they traded under the style of "Berlin, Ridley and Co." until March, 1921, when the partner retired and received £225 for his interest in the business. At the date of the dissolution there were sufficient assets to pay the partnership debts, and he continued alone and in his own name until he filed his petition. Witness attributed his insolvency to lack of capital and depression in trade. The examination was concluded.

A Paper Merchant's Failure.

A sitting of the London Bankruptcy Court was appointed to be held on January 20th before Mr. Registrar Mellor for the public examination of Edward John Suckling, paper merchant, Royal London House, Finsbury-square, E.C., trading as Suckling and Co. A statement of affairs had been lodged showing total liabilities £14,088 (unsecured £12,388) and net assets valued at £3,850, after allowing £1,033 for payment of the preferential claims.

Mr. Vincent Armstrong, official receiver, reported that the debtor filed his petition on November 26th, but did not lodge the statement of his affairs until the 14th inst. Under those circumstances he asked for the public examination to be adjourned until March 17th. The examination was postponed accordingly.

Government Contracts.

Contracts were entered with the following firms during December:—

H.M. Stationery Office.

CLOTH LABELS.—Fisher, Clark and Co., Ltd., Boston.

CLOTH, TRACING.—B. J. Hall and Co., Ltd., Cheadle Heath; Winterbottom Bookcloth Co., Ltd., Manchester.

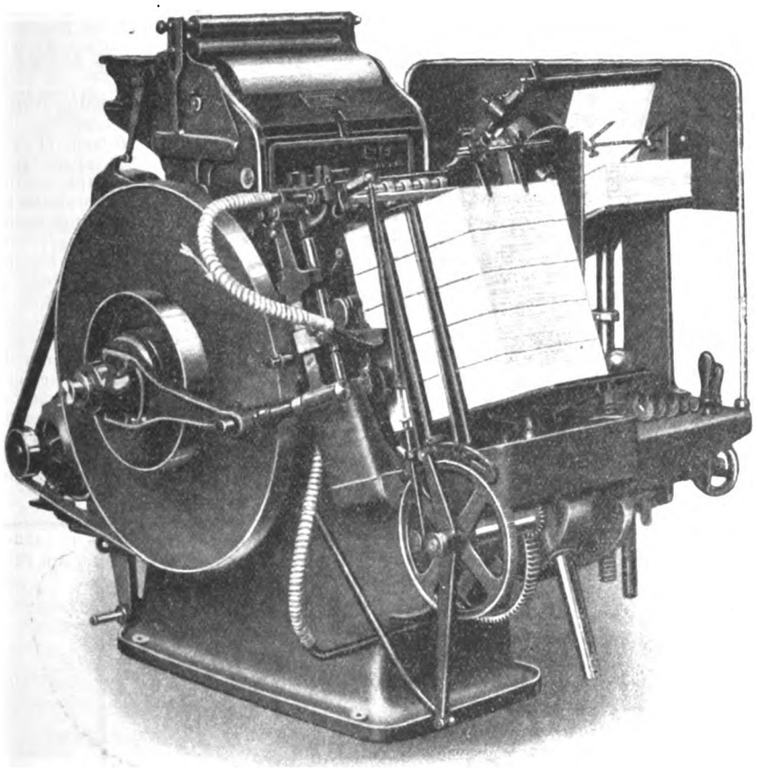
ENVELOPES.—Chapman and Co. (Balham), Ltd., London, S.W.; McCorquodale and Co., Ltd., Wolverton; Millington and Sons, Ltd., London, N.

MILLBOARDS. — Jackson's Millboard and Paper Co., Ltd., Bourne End; Waterlow and Sons, Ltd., London, E.C.



MOCK VELLUMS.—H. Band and Co., Brentford.

Crown Agents.

LINOTYPE MACHINERY.—Linotype and Machinery Limited, London.

BOOKS.—L. Reeve and Co., Ltd., London, W.C.

PAPER.—The North of Ireland Paper Mill Co., Co. Antrim; The Olives Paper Mill Co., Woolfold, Bury, Lancs.

Compare your present platen with the remarkable

HEIDELBERG AUTOMATIC PLATEN

THE HEIDELBERG will take all papers from Tissue to Card with minimum of adjustment. Equally good for long or short runs.

THE HEIDELBERG will print envelopes, wages bags, etc., two on. No FEEDERS required. One operator can control two or three machines.

THE HEIDELBERG stops of own accord when sheet is not fed or paper feed emptied.

THE HEIDELBERG is fitted for drive by both shafting and electric motor; power required ¾ h.p. It weighs about a ton packed (2,300 lbs).

THE HEIDELBERG has solved in the most brilliant manner the problems of large output, small labour charges and moderate initial outlay.

THE HEIDELBERG is amazingly simple; moreover, it is foolproof. Most printing house accidents occur with ordinary platens. The Heidelberg renders it practically impossible for the operator's hand to be crushed.

THE HEIDELBERG can be delivered to your works for very little more than an obsolete platen. Moreover, it will do the work of three platens.

THE HEIDELBERG makes it possible for work to be obtained which would otherwise go elsewhere.

THE HEIDELBERG speeds up output and cuts down wages in a remarkable manner. Several firms are installing a battery and scrapping their old hand-fed platens.

Personal.

VISCOUNT BURNHAM and Lord Riddell are among members recently elected to the Society of Authors.

VISCOUNT BURNHAM will give an address on "South Africa" at a Livery luncheon at the Stationers' Hall, on February 10th.

AS THE guest of the Press Club at luncheon on Thursday last, Mr. Baldwin was presented with a briar pipe of unpretentious appearance, which the greatest experts who had been consulted declared to be the best of its kind in the world.

SIR EDWARD GOSSE was the guest at luncheon at the Cafe Royal of the Foreign Press Association.

MR. J. E. REEVE, late general manager of Messrs. Geo. Mann and Co., Ltd., has been appointed representative of Linotype and Machinery Limited for the large and important district served from Bristol, where the district offices and showrooms are situated.

UNDER the auspices of the Nottingham District Committee of the Joint Industrial Council of the Printing and Allied Trades, Mr. H. M Stevenson, jun., lectured at Nottingham University College on Thursday on "Papermaking from the Forest to the Printing Machine," accompanying the presentation of a cinematograph film lent by Messrs. Chas. Walmsley and Co., Ltd., of Bury.

MR. STEVENSON explained the illustrations showing the production of pulp and the processes of paper manufacture, and afterwards touched upon photogravure printing, his remarks being illustrated with lantern slides lent by the Rembrandt Printing Co., of Lancaster.

MR. G. A. BENNETT delivered an interesting address at the luncheon of the Romford Rotary Club held on Friday. Mr. Bennett has travelled extensively throughout the British Colonies and in the United States, and in touching upon trade developments, expressed the opinion that England, with its vast responsibilities, was doing wonders under most trying conditions. Mr. Bennett, who is the patentee of the Klipto Loose Leaf Ledgers, has important business interests at Iowa, U.S.A.

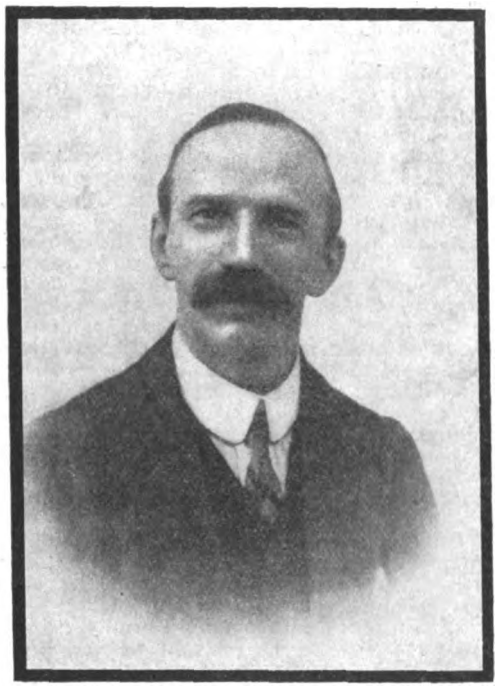
MR. FRED J. MELVILLE, the well-known postage stamp expert and president of the Junior Philatelic Society, is to give a lecture at Stationers' Hall on Wednesday next at 6.30 on "Postage Stamp Printing from the Early Days."

THE Central Districts Branch of the London Master Printers' Association, under whose auspices the meeting is being held, has arranged with Mr. Melville for an interesting exhibit of valuable stamps, including a unique sheet of the first penny black stamp, imperforate, plates, dies, and stamps.

MR. JAMES MILNE, a member of the composing-room staff of Messrs. Morrison and Gibb, printers, Edinburgh, has been presented with a gold watch on completing 58 years' service with the firm.

MR. J. LOUGHLIN, for 22 years a member of the composing-room staff of the *Birmingham Post*, has been presented by his colleagues with a mahogany chiming clock on his retirement after 22 years' service. Mr. Loughlin has been given a retiring allowance by the proprietor, Sir Charles Hyde.

MR. T. W. CHINN, of Cardiff, has been appointed editor of the new Labour newspaper for Newcastle and Tyneside, to be issued shortly.



MR. GEOF. S. WILLIAMS, vice-president of the Publishers' Association, will give a lecture on "Publishing" at Stationers' Hall, on Friday, February 13th, under the auspices of the Stationers' Company and Printing Industry Technical Board.

Mr. Horace H. Wise.

It is with deep regret that we record the death of Mr. Horace H. Wise, the works manager of the Milford-lane Works of the Sun Engraving Co., Ltd. Mr. Wise met his death most unexpectedly on Saturday morning. Hurrying to catch his train he collapsed and died—probably as the result of heart failure—soon after the train had started.

Mr. Wise joined Andre and Sleigh, Ltd., in 1895, many years before the amalgamation of

Mr. Horace H. Wise.

that concern with the Sun Engraving Co., Ltd. Mr. Wise was apprenticed as a studio operator, but owing to ill-health he left for a time, but on his return became an etcher, and later a colour etcher, showing outstanding promise.

Mr. Wise's abilities as a workman, his splendid common sense, his integrity and a most unusually charming and obliging way, all combined to single him out for promotion, with the result that about ten years ago he was appointed to the position he occupied at the time of his death. In this he filled an important and difficult position, holding a nice balance between employees, representatives and customers in such a way that he secured the respect and esteem of all. In fact it is not too much to say that the directors and staff of the Sun Engraving Co., who were in close contact with "Horace," respected him for his outstanding ability and really loved him for the unfailing kindness and courtesy he displayed on all occasions. He was, indeed, a Christian gentleman who carried the real charm of a quiet Christian life into his daily work. His loss is mourned not only by his wife, daughter, and relatives, but by all his comrades at the Sun Engraving Co., Ltd., and also by a large circle of clients, to whom by his sterling qualities he had become almost more than a friend. His death will be most keenly felt, and it is difficult for anyone not in direct and constant touch with him to have realised how much he was respected.

Mr. Wise was an ardent Wesleyan and took a very live interest in the Wesleyan Church affairs at Watford.

Britain's Biggest Trade Fair.

Next Month's B.I.F. at Birmingha

Optimistic views of a big trade revival in 1925 are srrongly supported by the excellent prospects that are opening up for the British Industries Fair, which takes place at Birmingham from February 16th to February 27th. Mainly on account of the London section of the Fair having this year been transferred to Castle Bromwich, it will be by far the largest exhibition of the kind ever held in this country.

The range of goods is much wider than in any previous trade display, and more than 200,000 invitations have been issued to buyers at home and abroad. With the exception of two industries which have never taken part in the Fair—textiles and finished motor cars—every kind of British manufacture will, for the first time, be shown under one roof. The Exhibition Hall at Castle Bromwich is the largest in the country, and the fact that more than 170,000 square feet of space are placed at the disposal of exhibitors is an indication of the immense effort being made to develop world markets for British goods.

The date of the Fair is immediately prior to that of Leipzig, which by reason of its centuries-old establishment, has long enjoyed an advantage as an international buying centre, but this year, it is believed, owing to the additional facilities provided, that the official British Fair will make still further headway in diverting to home industry the orders to which it is entitled.

Official interpreters have been engaged for the benefit of foreign visitors, and the descriptive catalogue of the Fair, which is a valuable buyers' book of reference circulating throughoat the world, is printed in three languages. Special railway tickets at a fare and a third for the return journey, will be issued from every part of Great Britain.

As on this occasion the entire British Industries Fair is to be held at the same time and place, instead of two sections a hundred miles apart, there is evidence that most of the visiting buyers will make a prolonged stay in the Midland capital or the surrounding district. The Chamber of Commerce has received many requests to reserve hotel and private accommodation; a special bureau has been set up for the purpose, and those who have not yet made their own arrangements will do well to communicate at once with the secretary. While the utmost care has been taken by the Fair management committee to issue individual invitations to all home buyers likely to be interested, and the response has been magnificent, it is particularly urged that any who may not have been communicated with personally will get into touch with the Chamber of Commerce without delay.

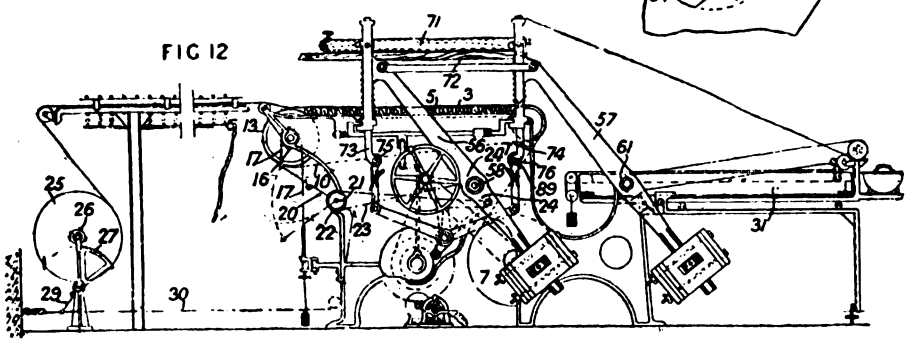
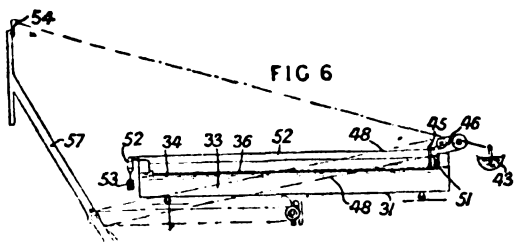
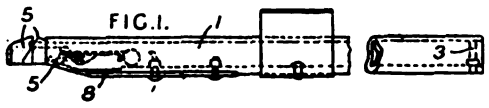
New Inventions



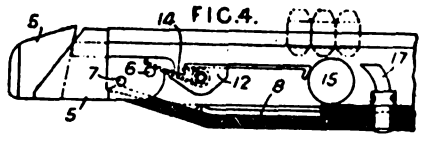
Web Colour Printing.



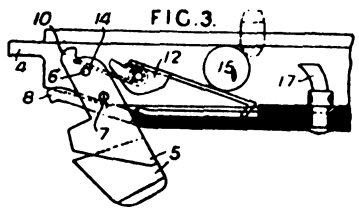
In a machine invented by Mr. J. Anquetin for printing coloured designs on a number of webs of wall-paper, the latter are drawn intermittently from supply rolls over a printing table provided with felt blocks of adjustable height and are printed by printing plates mounted in a frame carried by parallel levers which swing the printing plates to and fro between the printing table and felt inking pads, the webs being then rewound after passing over drying apparatus.



Platen Machines.—The frame 71 carrying the printing plates 72 is mounted on pairs of paralled levers 56, 57 swinging on parallel shafts 58, 61, the shaft 58 being rocked by means of a cam 84 and link 80, Fig. 9, to move the frame over the ink trays 31 and then back over the printing table 5. A wavy portion of the cam 84 causes the printing plates to be beaten down several times during inking. When the frame 71 arrives in position over the printing table 5 it is pulled down to effect the impression by drawing rods 73, 74 terminating in spindles 75, 76, which at that time are engaged by hooks 89, Fig. 10, on links 88 actuated by means of cams 94, 95 and levers 87 and guided by pins 90 moving in grooves 91. After the impression, the left-hand drawing rod is released from its hook some time previous to the right-hand one, whereby the frame 71 is raised obliquely from the printed webs, as shown in Fig. 11. The printing table 5 comprises an aggregation of adjustable felt blocks 3.



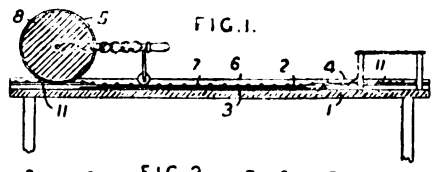
Inking Apparatus.—Ink is applied to each printing plate by a layer of felt 36 in a tray 31 which may be filled with water 33 to the level of a skin 34 stretched below the felt. Ink is supplied to one end of the felt by a long brush 45 on an arm 46 which is oscillated to and from a supply trough 43 by means of a cable 48 connected to the lever 57, and is distributed along the felt by a brush 51 reciprocated by a weight 53 and cable 52 attached at 54 to the lever 57.



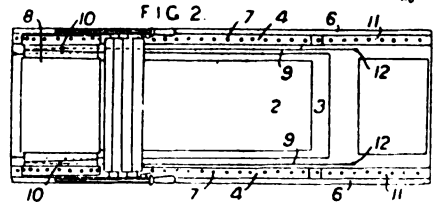
Feeding, etc., Webs, etc.—The webs are drawn intermittently over the printing table 5 from the supply rolls 7 by a pair of endless spiked belts 10 passing over wheels 13 actuated through a ratchet 16 by a cord 17 pulled by a flexible arm 20 on a shaft 21 oscillated by a pulley 22 and a cable 23 attached at its ends 24, 24' on either side of an oscillating lever. The rewind drums 25 are driven by a ratchet 26 and toothed sector 27 rocked by a flexible arm 29 connected by a cable 30 to a suitable oscillating member of the machine.

Printers' Composing Sticks.

An invention that relates to composing sticks for grooved type, of the kind having an adaptor of the kind described in Specification 26022/08 for facilitating distribution of the type, the adaptor is pivoted to the pronged end of the stick, so that it can be moved into and out of operative position, a type retaining device being provided to prevent spilling of the type when the adaptor is out of use. The stick 1, Fig. 1, is provided with the usual central slot, and is closed at one end 3, and has prongs 4, Fig. 3, at the other end to suit the channels of the forme. The adaptor 5 is



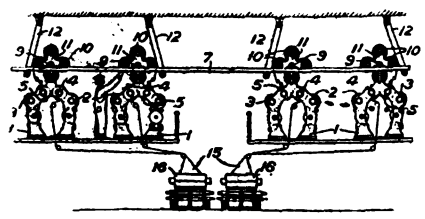
mounted on a pivot 6, and is held either in inoperative position, Fig. 3, or in operative position, Fig. 4, by a spring 8 bearing against



a pin 7. When the adaptor is out of use, the type are retained in the stick by a ball 15 movable in an inclined race formed by a pivoted member 12. When the adaptor is in use, a tooth 10 thereon raises the member 12 to an horizontal position against the pressure of a spring 14, so that the ball is retained between the member 12 and a stop 17. Specification 222,314 also is referred to. The patentees are Mr. W. H. Storey and Roneo, Ltd. In another invention by the same patentees, slotted composing sticks for use with grooved type are provided with type-retaining means in the form of balls which roll into the path of the type when the stick is tilted. The balls 18 are mounted in inclined races 17 formed on or attached to the stick 10, and their motion is limited by stops 19.

Printing on Fragile Materials.

An invention relating to printing apparatus, particularly for printing on glass and like fragile materials, as patented by Mr. O. Sivertzen, comprises a table 1 to carry the article to be printed, a printing roller 5, of elastic material such as rubber or wood pulp, pegs 7 on the table on the roller 5 which engage corresponding holes in the roller or table, and guiding means on the table for the roller, for example, a pair of rails 4 on which



the roller rolls. When printing on glass or similar fragile materials, the glass 2 rests on an elastic support 3 such as a sheet of rubber. The rails 4 are covered with an elastic material such as rubber, and have raised edges 6 to prevent axial movement of the roller. To raise the roller from the article printed, adjustable sloping extension rails 11 are provided at each end. To guide the roller in its travel a flexible member such as a wire or chain 9 may be arranged on the inner side of each rail 4, the wires being passed round the roller and fixed to it at mid points 10, while the ends of the wires are fixed to the table at 12. The printing surface 8, which may be of linoleum, is placed round the roller, and inking rollers may be arranged as indicated in the drawings.

Rotary Machine Improvements.

Mr. G. A. E. Kohler has patented an invention whereby in a printing press of the kind comprising a frame, printing cylinders mounted thereon, a paper holding device located above the cylinders, and a folding device located below the frame, a paper roll carrier 11 is mounted in bearings 9 on the frame 1 and a belt 12 is provided adapted successively to engage the rolls 10 to feed the web to the cylinders. As shown, four printing units are arranged side by side and each unit

comprises blanket cylinders 4, 5 and plate cylinders 2, 3 of the same size as the blanket cylinders, the latter being arranged between and above the plate cylinders. Rails 7 are arranged between the frame 1 and bearings 9 to increase the stability of the carriers 11. The webs pass downwardly from the printing cylinders to two sets of collecting and folding devices 15, 16.

(Continued from page 67).

Printing Inks.

the plate. Owing to the speed of the machine the ink must dry much more quickly than is necessary with ordinary flat-bed inks. This result is achieved by making the ink with rectified white spirit which causes it to vaporise on the unengraved portions of the cylinder before it comes in contact with the paper. In some machines there is a row of compressed air jets operating against the copper to make sure that there shall be no stain or smear on the margins of the sheets.

Photogravure Ink.

The last type of ink to which I want to refer is one of the latest known to the trade, namely, the water photogravure ink. As the name implies, this ink is prepared without oil or spirit, and in consequence it has the great advantage of being non-inflammable. It is made with water-soluble pigments in the form of a paste which can be reduced with water if necessary, and it will dry on both paper and plate almost as quickly as a volatile spirit.

Having now referred in outline to the making of most of the principal printing inks, I want to mention some of the difficulties to which printers have drawn attention. "How to buy and use inks" as a general headline embraces some of the points I have in mind. Let me say in the first place it is seldom policy to buy cheap inks. A printer usually gets what he pays for, and in such circumstances he should be satisfied.

Buying and Using Inks.

There are occasions when inexpensive inks can be recommended, and as a general rule it might be said that for large type and absorbent paper a cheap ink is suitable, whereas for non-absorbent papers, fine blocks and small type a good ink is called for. An expensive bronze carmine ink would be quite wasted on a book paper, but a "pillar box" shade of red at half the price would look well.

On the other hand, a low-priced red that appeared a strong colour on an antique stock might resemble a pink when a thin film of ink had to be carried. This question of light inking is closely connected with the problem of drying, which is one of the principal difficulties that an ink maker is called upon to solve. There seems to be a growing demand among printers for inks that will dry quickly on paper and yet refrain from drying on the machine and rollers if left "standing" overnight. In some cases this request is unreasonable, as a printing ink can only dry in two ways, that is by oxidation or evaporation, and by absorption.

One of the reasons why linseed oil has always been used is because it is the best natural drying oil available. Modern requirements, however, make it necessary that we should get in advance of nature, and so powerful driers such as cobalt linoleate are added to speed up production.

A printer, for example, who has been using an ordinary ink on absorbent papers, finds that while the ink dries satisfactorily thereon, he can abstain from "washing up" at night, as it will be possible to run on in the morning without any trouble. He then has a job to execute on a hard paper, it may be highly calendered, or a coated art, but, although the surface is hard to penetrate, he expects, or shall we say hopes, that it will still be possible for his ink to dry quickly on this unyielding surface, and at the same time remain moist on his machine all night long. This difficulty is minimised to some extent by the use of a penetrative drier, which forces the paper to hold the ink. Such driers must, of course, be used with discretion, as a spirit which penetrates will also disintegrate, and if the linseed oil varnish in which the pigment is ground loses its grip on the colour, it is possible for the medium to go into the paper, and for the pigment to remain on the surface and powder off.

An alternative is the light inking I have referred to. By using a concentrated ink it is possible to carry a very thin layer which, while drying more quickly than a normal impression, will not be inferior in colour value to a full inking from a colour at a lower price. Obviously the expense of using the dearer ink is not very much greater, as more paper is covered by the same weight of material.

This brings us back to the earlier question: that it is usually wise to use good inks, even though they appear expensive. Coming from an ink maker, this may seem like special pleading; but when I tell you that the percentage of profit on the costly product is no greater than on the other, you will understand that an ink maker's only object in recommending the better article is that his customers shall be confronted with fewer trials.

Another source of trouble arises from the misuse of printing inks. There are a number of English printers who do a varied class of work and yet have a very limited knowledge of the materials they use, so that it becomes necessary to say that, failing some acquaintance with the composition of inks, they should be used only for the class of work for which they were originally purchased.

One of the most common mishaps is due to fading. A printer, let us say, works a circular in an emerald green. His customer is pleased with it and orders a showcard in the same colour. It fades, of course, and recriminations ensue. The printer should know, and I am glad to say the majority do know, that emerald is not made in a fast pigment. The same remark applies to the brighter violets, brilliant blue lake, blue shade geranium and magenta. Some people have the idea that because a bright colour is reasonably fast as a dress material it will be equally so as a printing ink. This unfortunately is not the case.

Yet another cause of disappointment arises from mixing colours together too freely. This, again, is often traceable to the buyer of print. He likes a cover, perhaps, that is printed in a certain brown and thinks this would look well on a job in which there are some half-tone portraits. In the matter of shade he is possibly right, but when the printer, to use up some ink he has in stock, decides to blend his heavy cover brown with some process ink, he is taking a risk which is likely to lead to trouble in working.

It is possible that at the conclusion of my remarks someone may say you have not given us a single formula for making printing ink. This is so, and for two reasons. In the first place, probably very few of you will want to become printing ink makers, and, secondly, an ounce of practice is worth a pound of theory. There can be few trades in which a longer practical experience is necessary to produce a good all-round craftsman. It is possible to give two men the same formula and the same materials, and to find that the ink made by one will print well and that made by the other will work badly. An alteration in the order in which the ingredients are put together is sufficient to spoil some inks, and as for variations in atmosphere and temperature—that is a study by itself.

It has been suggested on more than one occasion that printing inks should be standardised. Desirable as this result may be, I look upon it as a practical impossibility. When it is remembered that for much of the big work printed in this country separate inks are made for each job, and that printers like to know that they are having special inks prepared for them, it is easy to see that standardisation is a far-away goal. I do not think it would be an exaggeration to say that if you could look into the cupboards of a thousand different printing offices in England to-day you would not find the same selection of inks in any two of them!

The making of printing ink is an occupation full of interest and variety, but the maker incurs many responsibilities. If, therefore, his contribution towards the printed word does not always come up to your expectations, let your criticism be helpful, so that he may the better serve you on the next occasion.

FLORENCE BOOK FAIR.—In collaboration with the Publishers' Association, the Department of Overseas Trade is organising a British section at the International Book Fair to be held at Florence from April 16th to June 16th. Great Britain has been allotted space in the main building in the shape of a gallery with an area of over 2,500 square feet. The collection of exhibits is in the hands of the Publishers' Association, while the Government Department is undertaking the transport and installation work. There will be exhibits of historic interest and specimens of fine printing and book production.

QUARTERLY EXPORT ISSUE—MARCH 19, 1925.

PUBLICITY AND PRINT

are inseparable. One could not exist nowadays without the other.

Newspaper Publicity is a necessity to the modern business. Publicity must, however, be undertaken systematically with the right journal or journals—journals with a recognised reputation.

The selling power of space depends upon a reputation backed by results, and these results must tell every time. Reputations are, however, not made in a day.

It has taken some forty years to establish the present-day reputation of the **Quarterly Export Issues** of the

British & Colonial Printer & Stationer

At the present time this Journal is the recognised overseas medium of the Printing and Allied Trades.

It circulates among buyers in the following markets:

Australasia	**China**	**South America**
India	**Japan**	**Canada**
East Indies		**United States**
West Indies		**South Africa**

RESULTS

One of the most successful of our advertisers says:—

"It will no doubt interest you to learn that during the past few years we made considerable additions to, and have extended our Export Dept. We thank you for the assistance that your journal has contributed towards this export business."—C. B., Ltd.

The next issue will be published on Mar. 19.

Can you afford to neglect this opportunity of extending your export trade?

CONTINENTAL PRINTING.

A Report by Mr. J. R. RIDDELL

(Principal of the London School of Printing).

In submitting the following report of my visit to a few of the printing centres on the Continent, many details have been omitted in order to keep the statement within reasonable limits. The tour, which included Belgium, France, Switzerland, Germany, and Holland, extended over 2,000 miles. Switzerland was not originally included in the itinerary, but a journey was made to Berne to see new processes applicable to lithographic printing.

Unfortunately, such towns as Zurich, Munich, Prague and Vienna were not included in the programme, and judging from reports and specimens examined, high-class work is undoubtedly being produced in these towns. Vienna claims to possess the finest printing technical school in the world.

Belgium.

ANTWERP.—A number of printing offices were visited. Many old-established firms have been practically re-equipped since the War, to a large extent with machines of German manufacture. Most of the offices inspected were over-crowded, poorly laid out, and gave little indication of good organisation. There was one notable exception: a firm at Merxem, in the suburbs of Antwerp, connected with a large tobacco company who had erected a new factory on the single-floor principle, provided with the latest English, American, and French machinery. It is an ideal printery, with superb offices and splendid workrooms. The latest methods for printing both by letterpress and offset methods are in operation, under ideal hygienic conditions, and the subsidiary departments such as electrotyping and folding box making are correspondingly well equipped with many labour-saving devices.

No printer would think of visiting Antwerp without paying homage at the shrine of the great master printer—Plantin. The Museum Plantin-Moretus is a fitting memorial to a great man and a patriot. A visit to it is not only an education but an inspiration. Many lessons can be learned by a study of the work contained in the rooms in which that famous man and his successors worked and lived.

Very little attention seems to be given to the technical education of printers in Antwerp, only two or three rooms in a trade school being set aside for printing. These are decently fitted-up, but, I understand, only a few apprentices attend in the evenings.

BRUSSELS.—The conditions in the printing offices are similar to those obtaining in Antwerp. The work done, while fairly good, does not reach the highest standard.

The outstanding feature of most Belgian printing offices is that usually the employer's residence is on the premises, and from the street no one would imagine that a printing office lay behind the noble frontage which contains the stately rooms in which the employer lives.

Technical education in Brussels is well advanced. There are a number of nicely arranged schools, the largest attendances of apprentices and journeymen being on Sunday mornings, although classes are held during the evenings. In one building is housed a school for lithographers, where every method of lithographic printing is taught, and also a guild of 700 letterpress journeymen printers who produce some very good examples of letterpress work. Special classes are held for the study of colour and its application to printing.

Le Musée du Livre is a society instituted for the purpose of fostering good printing. This is done by exhibitions of printed work, and by demonstrating the machinery required by those engaged in the printing and kindred trades. The exhibits are changed every month.

France.

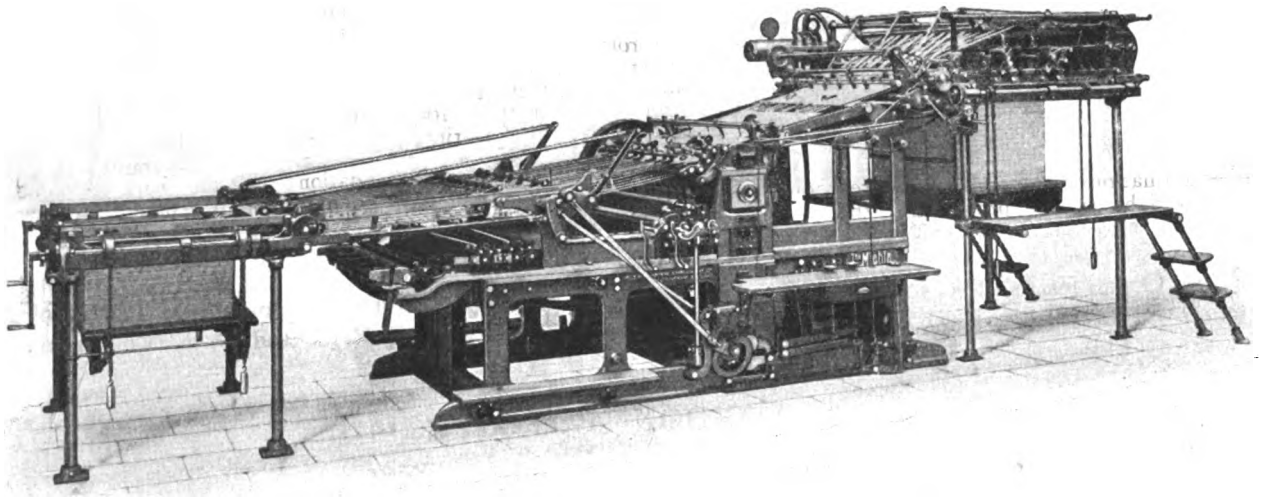
PARIS.—A number of firms were visited, many of whom were developing on the lines of offset. Some exceptionally fine work was being done in geographical and fashion printing. One in particular was producing from original plates by direct photo-lithography some of the finest work ever produced by this method. In certain instances, books were being printed from the web and delivered folded, the type matter usually being transferred—not photographed—on to the printing plate. One of the largest firms visited was doing excellent letterpress colour work, printing two colours on single machines. In this firm there is a "private rotary gravure department," where stamps and publishers' fine art reproductions are printed.

The technical schools in Paris mainly prepare students for the workshop. The Chamber of Commerce has been instrumental in instituting a number of trade schools where boys and girls between thirteen and fourteen years of age, on leaving the elementary schools, can take two or three years' courses similar to those provided in the junior technical schools in this country. Amongst the trades taught are printing, bookbinding, and box-making. The Ecole Estienne, a large school entirely confined to graphic arts, has some 250 students in fifteen different departments. Practically every reproductive process is taught, and it is possible to get a complete piece of work produced under the direction of one controlling mind. The ideal is admirable, but it is questionable if the methods and equipment of the school are such that students can be trained so that they may be able to undertake the work demanded in a commercial printing office.

PHOTO-ENGRAVING.—In Paris some splendid photo-engraving work is done. An opportunity was taken to see a new method of producing "high-light negatives" called the Bassani process. If the specimens of work shown were really produced by this method, it will prove a great aid in obtaining negatives suitable for photo-lithography by one operation. At present three operations are customary. Should the inventor visit England, he has agreed to give a demonstration of the process at the London School of Printing.

The newspaper offices gave no indication of the advanced state of organisation and equipment usual in our own country.

Switzerland.



BERNE.—As already mentioned, the tour was extended to Laupen, Berne, to investigate a process for reproducing books or illustrations from printed impressions. No camera is required for this process, and in many instances the result was quite good. A specially prepared paper is used as a negative, the image being obtained by reflected light. The same firm has also invented a "composing" machine for producing letterpress matter (tabular and text). There is a keyboard similar to a typewriter or monotype. When a key is depressed, a certain letter is brought into alignment, and when the line is completed it is automatically inked and an impression taken on a sheet of paper which, when a page is completed, is placed in contact with the specially prepared paper and exposed to light. The special paper is then developed and becomes the negative which is photographically printed direct on to the

Mr. Riddell's report to the London County Council on his recent visit to the Continent has been reprinted in booklet form at the request of the Advisory Council of the London School of Printing for circulation amongst the members of the executives of the associations who are contributing to the funds of the School. From this booklet the above is taken.

The Miehle

WITH AUTOMATIC PILE FEEDER AND PILE DELIVERY

The Miehle can now be supplied, as here illustrated, complete with the Pile Suction Feeder (with sheet-turning arrangement for perfecting) and Pile Delivery. Full particulars of these additional units will be supplied on application.

An important feature of the Feeder is an arrangement whereby it is unnecessary to disturb the pile of sheets when printing the reverse side. To feed the sheets and turn them over, the pile is put into the Feeder with the leading edge towards the outer feed roll. By this means the sheets are automatically reversed and come down on to the feed board the right way up. Thus there is no re-piling or turning over of sheets by hand, or re-piling or turning of the sheets when working a second or third colour on either side.

It is suction fed, the pumps for creating the vacuum for the suckers and the compressed air for the blowers being of the rotary type, driven by a small independent motor. Each sucker head carries two suction arrangements, two blower arrangements, and two sheet grips. A sucker head is also carried on the control for the height of the pile.

This Feeder, which is carefully designed and well constructed, is provided with safety devices which include multiple-sheet and no-sheet trips. The pile is automatically controlled, so that it is kept always at the right height for feeding.

The Pile Delivery deposits sheets clear of the machine, printed side up or down, on to a board or truck which automatically adjusts itself to the correct level throughout the run. The sheets as they fall on to the Delivery are automatically knocked up and keep the pile even on all sides. A blade is supplied for fitting over the centre of the board or truck for dividing slit sheets. Special provision is made for preventing the sheets from curling on their passage down the delivery tapes. The delivery can quickly be altered from face-up to face-down, or vice versa. Trucks for the removal of the pile can be wheeled in from both sides of the delivery.

The Miehle, the Pile Feeder, and Pile Delivery are manufactured by

LINOTYPE & MACHINERY LTD., 9 KINGSWAY, W.C.2

THE PAPER TRADE PROTECTION ASSOCIATION

Branch of THE BRITISH MERCANTILE AGENCY, LIMITED.

ESTABLISHED 1855.

Directors: ALBERT WILLMOTT. A. GRANVILLE WHITE.

Trade Advisory Committee:
Mr. J. S. ALLEN (Allen, Strong & Co., Ltd.)
Mr. FREDK. L. ARMSTRONG (Sec. of the Employers' Federation of Envelope Makers & Manufg. Stationers).

machine plate for printing by offset. A book was being reprinted for an English publisher by this method.

A supply of this special paper for experimenting was promised, and it is hoped that the process will be in use in the School at an early date.

The composing machine should prove of great usefulness in the reproduction of originals and the reprinting of books out of print.

A firm of letterpress printers, established for over 125 years, publishing very fine books and doing Government work, was also visited. They had in operation a special method of obtaining electrotype moulds. Most of the machines in use were of German manufacture.

There is a helpful system in operation in Switzerland whereby an apprentice has to sit for certain examinations conducted by a trade board. Should he fail or prove unsuitable, he is not allowed to proceed with his training.

Germany.

LEIPZIG, which is the centre of book printing in Germany, contains some of the largest printing firms in the world. One of these is working the Manul photographic process for reproducing printed books. A big licence fee is charged, but the process does not always yield the result claimed for it. Other photographic methods are being tried, all seeking to reproduce printed books without the cost of re-setting the type.

A number of lithographic firms doing excellent offset printing were visited, one of them probably producing the best colour-work in Germany. In this office the Wendum reversing and transferring press is in use. This consists of a frame for holding a stone, plate or type, from which an impression is taken on a rubber tympan, transfers pulled, "patched up in position and run down" on the machine printing plate.

Newspaper offices were visited, and in one a weekly pictorial supplement was being printed on a web offset press with folder. Some of the results were indifferent, while others were quite good. The method adopted was to photograph an illustration on to stone, from which it is worked up and transfers taken and patched up along with transfers taken from type formes. These are transferred to the machine plates. The output was about 4,000 copies per hour.

Photo-engraving in Germany has attained a high position, particularly in colour reproductions.

Technical Education.—Leipzig possesses a number of technical schools, the chief of which, the Academy of Graphic Arts, is a fine, well-equipped building with a large staff but few students. It has lofty ideals which, I fear, are seldom realised. There are other printing schools housed in imposing buildings to which apprentices are sent during working hours. The instruction is unfortunately, more academic than practical.

The Buchgewerbehaus (the Book House) is a large building in which are held permanent exhibitions of printing machinery and materials used by those engaged in the printing industry. It also possesses a magnificent hall containing a collection of books from the various publishing houses. This building claims to be the centre of the Leipzig printing trades. Many trade associations and manufacturers have their offices here, and one firm of offset machine makers have installed a machine with a photographic equipment for the purpose of teaching men photo-lithographic offset work.

DRESDEN.—This is a centre for the manufacture of printing machines. Certain works were visited, and, whilst the organisation and methods were thorough, many engineering works in Britain can compare most favourably with any seen. One newspaper has an offset rotary web running on a weekly supplement. Here again the results were of an indifferent character.

BERLIN.—It is claimed that this city is quickly becoming the centre of the printing industry in Germany, and there are a number of offices where every branch of the reproductive arts is dealt with. In one of the large firms producing many fine journals, the chief technical printing journal, *Buch- und Steindrucker* is printed. The offset method of printing is in general use, and in some instances very fine work is being done. The machine plates are made up by either of two methods: direct photo-litho. or transfers from specially etched plates. Rotary gravure is used to some extent in most of the German periodicals.

There is in use in Germany an "offset-letterpress" platen machine from which offset prints can be obtained from a letterpress forme.

The newspaper offices visited in Germany were disappointing, leaving much to be desired both as to organisation and production.

Technical Education for printers is practically unprovided in Berlin, it being catered for in one or two small rooms set apart in a general technical institute. The equipment is meagre and antiquated; a few students attend in the evenings. It certainly does no credit to a city like Berlin with its printing traditions, but efforts are being made to obtain a school worthy of the printing craft.

HANOVER.—The printing firms in this town are distinctly commercial, one large concern confining itself mainly to producing account books. The organisation for this class of work is extraordinarily complete, and the manner in which ruling and printing was done in one operation was an eye-opener. Particularly interesting was the method employed for marbling edges of books.

Holland.

AMSTERDAM.—A visit was paid to a notable firm of typefounders who have been in existence for 150 years. Over 300 hands are employed in casting type of different heights to suit the requirements of various European and overseas printing offices. It possesses a splendidly fitted up foundry, cleanliness and order being marked features of the establishment. There is also a museum, and a magnificently fitted board room which printing associations are allowed to use.

The printing offices visited did not show that a great deal of attention was paid to layout and organisation. The machines are mainly of German manufacture.

Technical Education.—In the Amsterdam School some 700 students are enrolled, 100 being full-time. The latter are young lads who have just left the elementary school and attend a three years' course in preparation for the works. About 200 attend during working hours and the remainder in the evenings. Separate workrooms are set aside for each year's group of students in the various sections contained within the school.

UTRECHT.—Here was found probably the best equipped and best laid out school for letterpress printers. This includes composing, machine, binding, photo-engraving and stereotyping departments. The practice of having separate workrooms for each year's students is also followed. The building, which was erected in 1910, is excellently laid out, and is doing the best work of any school visited, particularly in binding and marbling. The rooms are light and airy; there is ample lavatory accommodation; and the work is passed from one department to another in consecutive order. In fact, the whole school is all that could be desired by the most exacting educational idealist.

HAARLEM.—No visit to Holland would be complete without visiting Haarlem, the city where Coster was born. The Government printing is done by a firm which has been in existence for over 200 years, and the direct successors of the founders are still carrying on a business whose traditions and work appeal to the imagination. This firm not only produce good work by all printing methods, but are noted typefounders. One of the present heads of the business is a keen enthusiast for good printing and greatly interested in the standardisation and measurement of colour. There is an interesting museum in the establishment.

Mr. Riddell's "Personal Observations" on his tour will follow in next week's issue.

Paper Box Manufacture.

The U.S. Department of Commerce states that, according to data collected at the biennial census of manufactures, 1923, the establishments engaged primarily in the manufacture of paper and other boxes, not including wooden cigar and packing boxes, reported a total output valued at $257,711,401, of which amount $106,224,444 was reported by manufacturers whose principal products were set-up paper boxes; $75,811,327, by establishments making corrugated and fibre shipping containers as their products of chief value; $59,795,163, by makers of cartons and folding boxes; $3,962,983, by paper-can manufacturers; and $11,917,484 by makers of other containers, including lithographed, lacquered, and plain tin boxes, tea caddies and canisters of tin, and fancy boxes of wood covered with cretonne, silk, etc. The output for 1923 shows an increase of 47·9 per cent. in total value as compared with 1921, the last preceding census year.

In addition, paper boxes are manufactured to some extent as secondary products by paper and pulp mills and by a few establishments engaged primarily in other industries. The value of such commodities thus made outside the industry proper in 1921 was $18,367,029, an amount equal to 10·5 per cent. of the total value of products reported for the industry as classified.

BREHMER

Folding Machines.

BREHMER

ROTARY AUTOMATIC FOLDING MACHINES

Brehmer Folding Machines fitted with the Rotary Feeder, are capable of delivering up to 3,750 sheets per hour.

PRINCIPAL ADVANTAGES.

1. The feeder can be refilled whilst in operation.
2. These machines do not require any more space than those required for hand feeding.
3. They are accessible from all sides.
4. There is no smearing of freshly printed sheets.
5. Power required about 1/3 H.P.

IF YOU ARE INTERESTED SEND FOR FURTHER PARTICULARS AND SAMPLES.

AUG. BREHMER'S (BRITISH) SUCCESSOR.

(T. McAULIFFE)

Trade Notes.

MESSRS. BAZELEY AND CO., booksellers, stationers and fancy goods dealers, 52, Bedford-street, Plymouth, owing to expiration of lease, are shortly removing to premises at 14, Ebrington-street.

NEWSPAPER AND ALLEGED LOTTERY.—At Southend-on-Sea Police Court on Friday Walter Henry Knight was summoned for unlawfully publishing a certain scheme for the sale of tickets called "The *Southend Times* Shopping Scheme." The Chief Constable said the *Southend Times* published a list of shops at which tickets were distributed for goods purchased. Each ticket bore a number and the holders of the winning numbers were entitled to a prize. After a hearing which occupied the court the whole of the day the case was dismissed. The Chief Constable said he would appeal against the justices' decision.

LONG SERVICE RECOGNISED.—On Monday last a gold watch was presented by Messrs. Harrison and Sons, Ltd., to Mr. C. J. Coleridge on completion of 50 years' service with the company. On eight other occasions within the last few years Messrs. Harrisons and Sons have been able to make similar presentations, the receiptients being Miss E. Small, Messrs. G. J. Bishop, J. Barwell, C. Cleaver, R. Colls, T. H. Hewson, S. T. Mumford and L. P. Tuck, all of whom have served the company for a period of over 50 years, whilst both Mr. Cleaver and Miss Small have been with the firm for close upon 60 years, and are still actively engaged in the company's interests.

THE Birmingham Jobbing Printers' Guild held an exhibition of their work on Thursday last at the Birmingham School of Arts and Crafts. The object was two-fold, for it was intended not only to inspire operative printers with the ambition to become real craftsmen, but also to interest the consumer—*i.e.*, the user of printing for commercial and other purposes —in "better printing." Examples were sent in by some of the best workmen in the trade, and space was also devoted to efforts of student printers. Commercial printing, catalogue work, typography, half-tone process, three-colour colour printing, etc., were on view. At a meeting, the chair was taken by Mr. H. Eden (president of the Guild), and the speakers included Mr. E. Dusson and Mr. B. J. Fletcher (principal of the School of Art).

A SCHEME approved by the Birmingham Education Committee for the establishment of a new Junior School in Vittoria-street provides for the training of suitable boys to enter the printing trades. Instruction in the practical side of their work is to be given at the Central Arts and Crafts School, and this extra teaching makes it necessary to have on the staff a full-time, instead of a part-time, teacher of typography. At a meeting on Friday last, Mr. Leonard Jay was appointed whole-time teacher of typography and made head of the printing department of the Central School at a salary of £500.

THE fourth annual social arranged by the Sheffield District Committee of the Joint Industrial Council of the Printing and Allied Trades, was held in Sheffield at the Cutlers' Hall on Saturday night last. Among the six hundred persons present were Mr. W. A. Townsend, of the National Joint Industrial Council; Mr. T. S. Chalmers, president of the Sheffield District Committee; and Mr. H. G. Marsden, the vice-president. The event was organised by Mr. J. Swain and Mr. G. K. Marshall.

CARMELITE HOUSE overseers met at Frascati's on Wednesday evening of last week, under the chairmanship of Mr. F. Fone, of the *Evening News* composing department, for the sixth annual dinner of the Carmelite House Overseers' Association. During the evening a presentation was made to Mr. T. W. Geroge from the members of the association.

THE second annual dinner of the composing-room chapel of Messrs. William Brendon and Sons, Mayflower Printing Works, Plymouth, was held at the Piccadilly Restaurant last week. The company of nearly 60 sat down under the presidency of Mr. A. J. Wood.

THE late Mr. William Ernest Willson Leicester, printer, left £51,516 (net personalty £46,492).

THE late Mr. James Harwood Panting (71), of Norbury, London, S.W., a former member of the editorial staff of the *South London Press*, left £5,864.

THE members and friends of the Sunday Newspapers' Cricket League had a very enjoyable evening together on Monday last at the Lever House Restaurant, Blackfriars, where their annual dance was held. No effort had been spared to make the event a very successful one, and the secretary and his committee, together with the M.C., Mr. Pfaff (*Express* Newspapers) are to be congratulated on the highly satisfactory results of their efforts. A very large number was present, the accommodation being taxed almost to its limit. The League was extremely fortunate in securing the services of Jimmie Gardner and his Gleniffer Dance Orchestra (several members of which have been heard through the B.B.C. on the wireless programme). In addition to the latest dance music they contributed many recent favourites which, judging by the encores, were highly appreciated. There is little doubt that the presence of Gardner's band materially contributed to the success of the dance. A number of prizes were awarded.

ON Monday next, February 9th, at Wortley Hall, Finsbury-park, the North London Master Printers' Association holds its first exhibition of members' work. Proceedings commence at 7 p.m.

ON Tuesday next, February 10th, at the Bridge House Hotel, London Bridge, the Association of Master Printers of South-East London meets at 6 p.m., and several matters of interest will come up for discussion.

THE Printing Trades Alliance will hold its annual dinner at Anderton's Hotel on Saturday, February 21st.

AN appeal is now being made for funds wherewith to launch the *Sunday Worker*, a proposed new Labour weekly representing particularly the Left wing of the Labour Party. The committee which is making the appeal includes Mr. Tom Mann, Mr. Saklatvala, Dr. Robert Dunstan, and Mr. A. J. Cook.

UNDER the title of "The Miracle of Fleet Street" will appear in a few weeks the story of the *Daily Herald*, by George Lansbury, M.P., and, in consequence, practically a personal memoir of the author from 1911 to 1925. The book will be made still more interesting by containing nineteen reproductions of cartoons by Will Dyson and, on the cover, a portrait of Mr. Lansbury. It will be published jointly by the Victoria House and the Labour Publishing Co.

SIR CHARLES HYDE, the proprietor of the *Birmingham Post*, has announced to his employees that as from January 1st last he will pay all contributions of his employees under the National Health and Unemployment Insurance Acts.

FIFTY years of useful life has just been completed by the *Hendon and Finchley Times*.

JOHN ALLEN AND SONS (IVYBRIDGE), LTD.—Creditors of this company (in voluntary liquidation) are requested to send in particulars of their claims, etc., on or before March 6th, to the liquidator, Mr. R. J. Blackadder, Norfolk House, 28, Norfolk-street, Strand, London, W.C.2.

THE death has occurred of Mr. John Lane, the publisher, aged 70. He had had influenza which developed into pneumonia. Mr. Lane entered publishing in 1887, when, with Mr. Elkin Mathews, he founded the Bodley Head publishing business. This partnership was dissolved seven years later, and since then Mr. Lane alone conducted the firm, which became one of the most notable in Britain.

MR. JOSHUA CROWTHER, a partner in the firm of Messrs. J. and W. Crowther, engineers, who specialised in the repair of printing machinery, has died at Belfast at the age of 66.

THE death occurred last week at Sale of Mr. John Fergusson (56) for 25 years on the editorial staff of the *Manchester Evening News*.

MR. H. A. CARTWRIGHT, editor and managing director of the *Hong Kong Daily Press*, died last week at Hong Kong from typhoid fever, in his 48th year.

THE funeral took place at Watford Cemetery last week of Mr. E. Voss, for many years secretary of the Watford Master Printers' Association.

THE late Mr. James Harwood Panting (71), of Norbury, S.W., a former member of the editorial staff of the *South London Press*, left £5,864.

A ROOM has been set apart by the London School of Economics and Political Science, Houghton-street, W.C., for the exhibition of modern office machinery.

ACCORDING to the *Ministry of Labour Gazette*, there were 21 registered trade unions in the papermaking, printing, etc., group of trades, with a membership at the end of 1923 of 131,000. The income of these organisations was £527,000. Expenditure on unemployment, travelling and emigration benefit represented £216,000 and other expenditure £269,000, while the funds at the end of 1923 were £494,000.

CHANGES in rates of wages and hours of labour show that in paper, printing, etc., in this country, 3,000 people obtained increases and 1,000 decreases in the period covered by January-November, 1924. The increases represented £400 in weekly wages and the decreases £150.

THERE was one case of lead poisoning in the printing trade during December, and two fatal accidents in the paper, printing, etc., group of trades.

PLANS have been approved for the erection of a new warehouse at Fenniscowles, for the Star Paper Mill.

FROM February 1st the price of those French newspapers which now sell at 15 centimes will be raised to 20. The increase was actually decided upon in October last, but it was subsequently found possible to postpone its immediate application. Now, however, economic conditions are considered to render it inevitable.

THE Paris *Journal*, one of the morning papers with large circulations, has changed hands. M. Henri Letellier, who has been the principal owner for many years, has ceded his interest to a group comprising M. Cornuché, the owner of casinos; M. Rénier, of the avas Agency; M. Finaly, a director of the Bank of Paris and the Pays Bas; and M. Darblay, the paper dealer. This group already controls the evening paper, *Paris-Soir*.

Trade Union Matters.

TYPOGRAPHICAL ASSOCIATION REPORT.—The 150th half-yearly report of the Typographical Association states that the Executive Council records with gratification the continuance of the indications of improved conditions in the printing trade. There has been a considerable reduction in the amounts expended on unemployment benefit, and the funds of the Association have consequently benefited. The membership at the close of the half-year numbered 30,552, an increase of 174, fully employed members at 23,430 showing a gain of 300. Out-of-work payments totalled £17,200, a decrease of £3,500, and unemployment insurance payments £12,770, a decrease of £2,155. The general fund at the end of the half-year stood at £29,215, an increase of £7,883, and the superannuation fund at £82,497 showed a gain of £1,942. The total funds amounted to £111,712, equal to £3 13s. 1½d. per member, compared with £101,886, equal to £3 7s. 0¾d. in the previous half-year.

MANCHESTER NEWSMEN.—A special meeting of the newspaper members of the Typographical Association at Manchester has passed resolutions declaring against any time-balancing proposals from the employers, and that stoppage of overtime is now necessary to convince the employers that the newsmen's programme must be granted. The meeting also decided to appeal to local jobbing workers to vote against the employers' proposals.

THE Southport Typographical Society has passed a resolution, which is to be sent to the Town Clerk and the Labour members of the Town Council, strongly protesting against the action of the Town Council in accepting from a distant town a tender for the Southport official guide, "seeing that the wages paid in the town in question are several shillings below the Southport rate."

OFFICIAL UNEMPLOYMENT FIGURES.—The Executive Council of the Typographical Association, who some time ago requested the Ministry of Labour to publish in the monthly *Gazette* particulars relating to the unemployment of letterpress printers, have received notification that an endeavour will be made to publish separate figures for the following districts: London, Northern Counties, Yorkshire, Lancashire and Cheshire, Midland and Eastern Counties, Scotland, and "other districts."

Huddersfield Master Printers.

Seventh Annual Dinner.

The Huddersfield Master Printers' Association held its seventh annual dinner on Friday at the Queen's Hotel, and the function was no less successful than those which had preceded it. Though ill health or business engagements unhappily prevented some from being present (among whom was the Federation president, Mr. Wykes), a goodly number partook of the excellent fare provided.

Mr. Percy Hartley, the newly-elected president of the Association, was in the chair, and was the subject of a congratulatory toast, proposed by Mr. Moorhouse, to which Mr. Hartley responded in felicitous terms.

"The Federation of Master Printers" was ably proposed by Councillor W. Halstead, who spoke of the loyalty of the printers of Yorkshire, and pledged their continued allegiance to the Federation. He referred to the necessity which prompted every business man to insure against possible loss, and urged the equally important duty of insuring success by having a proper costing system.

Mr. Geo. F. Storey, president of the Yorkshire Alliance, with whose name the toast was coupled, replied in an interesting speech, in which he made complimentary reference to the energies of the youngest Federation president, Mr. Wykes, in the prosecution of his onerous duties. He made passing reference to the contribution of Yorkshire to the presidential office in the persons of Messrs. H. Cooke, E. G. Arnold and E. W. Humphries, of whose distinguished services Yorkshire was proud, and felt gratitude and admiration. Commenting upon collective advertising, he said thought for the morrow was, to the prudent man, translated into action for to-day. The Federation scheme was well-timed, coming just when industry was reviving. He contended that while the study of the craft side of the business was necessary, the study of the sales side was absolutely vital. His figures showing that barely 50 per cent. of the printing firms in the country employed over five employees were received with interest and surprise. He reasoned from this that to the remaining firms was left abundant scope for the extension of their business.

Mr. Pulford, the Alliance treasurer, responded to the toast of "The Yorkshire Alliance," proposed by Mr. L. Graham. He dealt mainly with finances, showing the satisfactory position of the Alliance, but urging the need for care in expenditure.

Mr. J. W. Roberts proposed the toast of "The Visitors," complimenting Mr. Storey for his inspirational speeches on different occasions. Mr. H. Gaskarth ably responded.

An excellent musical programme had been arranged under the direction of Mr. J. Broadbent. Miss Nellie Metcalfe and Mr. Arthur Broadbent contributed pleasing vocal numbers, and Mr. Herbert Leeming supplied the humorous element. The accompaniments were ably rendered by Mr. F. Eastwood.

The Printing Crafts Guild.

There was an interested and appreciative audience at the Municipal College of Technology on Saturday last, when Mr. W. M. F. Pullen carried those present by picture and story through "The Romance of the New Forest." Nearly all the illustrations had been hand coloured, and the richness of the scenes was quite a contrast to the stormy weather outside. After a brief explanation of the location of the forest and its nature, its life of a thousand years ago, and its drastic laws, next came the colour of the forest and its flowers. The old-world life was spiced with gipsies, forest ponies, donkeys, and pigs, and illustrations showed how nature disported itself. Then came Minstead Church, the gem of the forest, Gilpin of Baldre, Beaulieu and its ruined Abbey. Truly it was a delightful evening, spent far away from modern man's idea of life, many of those present having created in them an interest that will not be satisfied until they have spent a holiday roaming freely in the forest and living a life of ease and leisure.

WEE MAC.

IT is infinitely pleasanter telling how you put a thing over than explaining why you failed.

North Wales Master Printers.

Federation Activities.

The question of costing is having the serious consideration of printers of North Wales, and during the past week Mr. A. D. Hull, one of the cost accountants of the Federation of Master Printers, has had many interviews and has installed the Federation Costing System in several offices along the North Wales coast.

Mr. A. E. Goodwin, secretary of the Federation of Master Printers, was present at the annual general meeting of the Oswestry and Montgomery District Master Printers' Association at Newtown on Saturday last. He stated emphatically that the Federation was in no sense a ring or combination for fixing or maintaining prices, but its policy was and always had been an educational campaign of costing. Price lists were issued to enable members to check their costs and as a guide to those who were unable to ascertain their own costs. Mr. J. Ellis, of Llanidloes, who occupied the chair, was re-elected to the position of chairman, Mr. J. M. Pearson, of Welshpool, was re-elected hon. secretary.

Mr. Herbert Tomkinson, who recently retired from the business in Colwyn Bay which he founded and which bears his name, is taking up the duties of honorary secretary of the North Wales Master Printers' Alliance, and his appointment has met with general satisfaction throughout the area.

A special meeting of the Bangor and Anglesey Master Printers' Association was held at Bangor last week. Mr. W. Powlson, president of the Alliance, occupied the chair. Mr. L. J. Cumner gave a resumé of the work of the Federation, and Mr. A. D. Hull, Federation cost accountant, held the interest of the meeting in an address on "Some Advantages of the Federation Costing System." Mr. W. A. Foster, of Bangor, accepted the position of chairman of the Association, Mr. Evan Thomas was appointed vice-chairman, and Mr. Richard Thomas (who has been acting temporarily) was formally elected honorary secretary. There has been an increase in membership in Anglesey.

Arrangements are being made for a rally of the master printers of North Wales to be held at Wrexham on February 28th.

Printers' Liability for Customers' GOODS.

At the recent quarterly meeting of the Council of the Federation of Master Printers, Mr. A. E. Goodwin reported that counsel's opinion had been obtained on the printer's liability for loss of or damage to customers' goods. It was recognised that stocks of printed sheets warehoused by book printers were at the customer's risk, but the question had arisen in the case of firms who performed the printing as well as the binding, the printed quires being sometimes in the warehouse and sometimes in the process of binding. The opinion was being considered, and when issued would be a most valuable document, because it was understood to have been the subject of a round-table conference of a number of eminent members of the Bar.

A FINE new folder issued by Messrs. Linotype and Machinery Limited illustrates in impressive fashion the wide capabilities of the modern linotype in setting varied text and display matter, together with rules and decoration.

"OUTLINE AND STIPPLE TYPES" is the title of a neat booklet which reaches us from the old established typefounders, Messrs. John Haddon and Co., Salisbury-square, E.C.4. Effective display is made of some two dozen types, of faces that will appeal to many printers requiring something out-of-the-ordinary. "Boldness without blackness" is the aim of the designers of these types, and printers will find in the pages of this brochure some useful and pleasing faces which will be found to give, in certain cases, desired effects not otherwise obtainable. These types were all specially designed for by British artists, and are not of American origin. They are all cast upon the three-fold labour-saving principles of point line and point set upon point body which this firm introduced into this country about 25 years ago.

The Papermakers' Association.

Mr. C. R. Seddon presided recently at a meeting of the Executive Council of the Papermakers' Association, when a considerable amount of business was transacted.

The various standing committees for 1925 were appointed and preliminary arrangements were made for the annual meeting and dinner to be held on Thursday, March 19th.

A report was received as to the British Empire Exhibition papermaking plant, and it was decided that this should not be continued if the Exhibition opens this year.

Reports were also received as to the activities of the Association in connection with the Australian and New Zealand preference, trade facilities advisory committee, new customs classification (including kraft wrappings as a separate item) and the safeguarding of industries.

A communication from the Belgian Papermakers' Association as to a new form of wood pulp contract was received and referred to the Contracts Committee.

Proposals as to standardisation of paper sizes from the National Association of Wholesale Stationers and Paper Merchants and the Master Printers' Federation were received and referred to various sections for consideration and report.

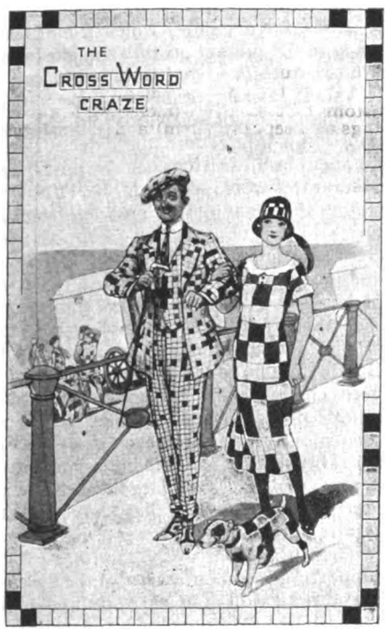
Resolutions of sympathy and condolence were passed in connection with the deaths of Lord Doverdale and Mr. L. P. Andrews.

German Paper Industry.

The Commercial Secretary at Berlin (Mr. J. W F. Thelwall) has forwarded to the Department of Overseas Trade a review based on reports of the Prussian Chambers of Commerce of the trade and industry of Germany during December, 1924.

It is shown that in the East Prussian cellulose industry business continued satisfactory and was, in part, very lively. Inland trade increased, while foreign business was much quieter. The competition of Scandinavian factories was much felt, as, owing to the mild weather, the latter were able to maintain their export business.

Employment in the paper industry was, in general, better than in the preceding months, but the turnover is not yet sufficient to bring in fairly normal profits. As goods are, for the most part, ordered for delivery within a short period, and in small quantities, business is difficult to judge and is irregular. The unequal development of prices for raw materials and finished manufactures presented great difficulties.



GERMAN PAPER TRADE DIRECTORY.—There has just been published from the offices of the *Papier Zeitung* (Berlin SW11, Dessauer-strasse 2), as a booklet in neat cloth-backed paper boards, the seventh edition (1925) of the "Address der buchdeutschen Papier-, Pappen- und Papierstoffabriken," *i.e.*, Directory of the German Paper, Board and Pulp Manufacturers, including also rag and waste paper dealers. This volume forms Part I. of a larger directory which will cover the whole of the paper industry of Germany, including stationers, office furnishers, trade associations, etc. The present volume is divided into two sections, the first arranged alphabetically under names of firms, and the second under the classes of goods handled; in the latter section the names of goods are specified in German, English and French. Price 5/6 post free.

THE NORWAY YEAR BOOK.—We have just received, with the compliments of the Union Paper Agency, Ltd., Oslo, Norway, a copy of the Norway Year Book, which is intended to serve as a handbook on present-day Norway. It is certainly a very useful volume, carefully prepared and containing a wealth of information concerning the country dealt with. The object is to give in concise and convenient form particulars concerning the economic, industrial, social and political position of Norway which have not been accessible hitherto in any single volume in the great language of the world. This object is well carried out in the more than 500 pages of the handbook, to which a useful index and a map of Norway add value. The industries of pulp and paper, of course, occupy a prominent place in the book, several pages being devoted to historical and statistical information. Printed in English, the information will be of great use to the people of this country.

"Cross Word" Post Cards.

That very popular newspaper feature, the cross word puzzle, has introduced to British newspaper readers a craze which had previously taken the United States by storm. The latest outcome of the cult is the production of a new series of picture cards in Messrs. Raphael Tuck and Sons' well-known "Oilette" series of colour picture post cards. In this

Raphael Tuck and Sons Ltd.

new series, entitled "The Cross Word Craze," a number of clever and amusing pictures illustrate some of the humorous situations in which too much enthusiasm may be expected to involve the devotee. The accompanying illustration shows one of these cards and depicts a startling effect of the craze in the realm of personal apparel.

Bankruptcies in the Printing Trade.

The statistics of the bankruptcies, deeds of arrangement, etc. for the year ended December 31st, 1924, have just been published. It is interesting to compare the result of 1924 with previous years in the printing and stationery trades. Details are as follows:—

	1922	1923	1924
Bankruptcies... ...	75	96	81
Deeds of arrangement	64	44	55
Bills of sale	276	354	353

The printing and stationery trades have suffered slightly less in 1924 than the average of the industries that are included in the return.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies,
Machinery for Sale and Wanted,
Businesses for Sale and Wanted,
Partnerships and Investments,
Miscellaneous.

One Insertion 3/0
Three Insertions 6/0
For every line exceeding three lines **6d.**

Situations Wanted.

Under this heading operatives are granted a Special Rate for a minimum of three lines (twenty-one words):—

One Insertion 1/6
Three Insertions 3/0
For every line exceeding three lines **6d**

The Penny Post.

HOPES and fears in regard to postal reform are now very critically balanced. The business world generally has shown very definitely its belief that penny postage and other postal concessions are now both possible and commercially sound; the Advisory Council set up to advise the Postmaster-General on postal affairs has strongly recommended a return to penny postage; and now a deputation to the Postmaster-General from the Joint Industrial Council of the Printing and Allied Trades has given further strong expression to the growing public demand for a lightening of postal burdens upon industry. The Postmaster-General appears to view the demand with understanding and sympathy. The chief danger now is that the Chancellor of the Exchequer may allow all other considerations to be over-ridden by the desire to raise revenue, for which purpose the postal system provides a convenient method of the indirect taxation of industry.

Printing Trade Deputation.

IT was on Tuesday that the Postmaster-General (Sir William Mitchell-Thomson, M.P.), received the Joint Industrial Council deputation. The deputation consisted of Mr. G. A. Isaacs (chairman of the Joint Council), General Wright Bemrose, Colonel H. Rivers Fletcher, Messrs. T. E. Naylor, M.P., J. McLehose, W. B. Wykes, E. H. Dennis, H. Skinner, and H. Chalk, together with the joint secretaries, Messrs. A. E. Goodwin and A. E. Holmes It was fully representative of both panels—the workers and the employers. The Postmaster-General was accompanied by Viscount Wolmer, Parliamentary Secretary to the Post Office; and the case for the Joint Council was submitted by Colonel Fletcher, Mr. E. H. Dennis, and Mr. G. A. Isaacs, their statements being amplified by other members of the deputation.

The Printers' Case.

MR. GEORGE A. ISAACS, president of the council, who introduced the deputation, said the restoration of the "printed matter" postal rates had proved of great value to the industry, but the confusion that existed, not only in the public mind but among printers and postal officials, as to what constituted "printed matter" was a constant source of irritation, and the cost of examining and surcharging packages must be considerable. Lieut.-Col. H. Rivers Fletcher, vice-president of the Federation of Master Printers, said the most valuable concession which the Post Office could make to industry at the present time would be the re-instatement of the letter rate of 4 ozs. for a penny, which would remove many of the present postal anomalies and the trouble occasioned by "trap" envelopes. Mr. H. Chalk gave figures showing the falling off in the quantity of post cards sold by the large publishing houses and the reduction in the number of publications sent by post since the postal rates were increased. Mr. E. H. Dennis stated that the picture post card manufacturers in this country had been able to meet German competition by adopting mass production methods, but increased postal rates had caused a decrease in sales, with the result that there had been unemployment among artists, block-makers and printers. Mr. A. E. Goodwin referred to the anomalies which had been created by the discontinuance of the sample post. The "printed matter" rates in the Colonies and foreign countries were considerably lower than the corresponding rates in this country. One large firm had written him to the effect that they had reduced their printing orders by 50 per cent., and letters had reached him from every part of the country supporting the contention of the Federation that a reduction of postal rates would stimulate the whole trade and commerce of the country.

The Postmaster-General's Reply.

THE Postmaster-General, replying to the deputation, said that although a number of questions had been dealt with, they all came back to the main point, namely, a reduction in the postal rates, and it must be obvious to everybody that any reduction would cost something. He asked the deputation which of the reforms referred to they considered the first and most desirable. Mr. Isaacs replied that the deputation were unanimously of opinion that the re-introduction of the penny post and the halfpenny post card rate were the most important. The Postmaster-General, proceeding, said it was true that there had been a satisfactory surplus this year, although it was not so large as they might have expected. They had, however, to consider the fact that their commitments were increasing, and that they had to face a considerable capital expenditure to provide for the expansion of the telephone service. In any direction in which they approached the question of postal reform they would need to go step by step. It had been urged that the Post Office accounts should be treated as a separate unit, and there was certainly a good deal to be said for that point of view. At the same time, they must realise that at present the Post Office accounts were part and parcel of the financial arrangements of the country in general, and, therefore, they could not expect him to anticipate the Budget statement; but he undertook to convey to the Chancellor of the Exchequer the views of the deputation. He did not think that it would be possible to institute special rates for picture post cards only, but the question of reverting to a half-penny post card rate would certainly also receive consideration. With regard to the sample post, he could not offer any hope of immediate action, and with reference to "trap" envelopes, the report from officials was to the effect that the adoption by many firms of the character of envelopes defined in the Post Office circular had led to considerable improvement.

Personal.

MR. GEORGE LANSBURY, M.P., has given notice of his resignation as general manager of the *Daily Herald*. He has been appointed editor of a new Labour and Socialist paper, to be called the *Weekly Herald*, the first issue of which will appear shortly.

MR. FRANK COLEBROOK is to deliver a lecture entitled "Some Points in Machinery Valuations" at the Auctioneers' and Estate Agents' Institute, Lincoln's Inn-fields, tomorrow (Friday).

FRIENDS of Mr. Dard Hunter in this country and America will regret to learn that he is suffering from an affection of the eyes, due to overwork. Although much improved, he is not allowed to use his eyes for reading or similar close work, and is advised to have a year's rest.

MR. G. CONEY was, at the second annual dinner of the *Daily News* publishing staff, held on Saturday night, presented with a gold watch and chain in recognition of his past services as father of the chapel.

MR. W. ELLIS, formerly of the *Newcastle Daily Journal*, has been appointed chief subeditor of the *Sunderland Daily Echo*.

MR. HAROLD TAYLOR, editor of the *Shields Daily News*, lectured to the members of Newcastle-on-Tyne Rotary Club last week on "The World's News."

MR. W. MONKHOUSE, ex-president of the Drawing Office Material Manufacturers' and Dealers' Association, left for the South of France last week with the good wishes of his friends that his health will be restored.

MR. C. G. MCCANN, managing director of Messrs. Spalding and Hodge, Ltd., has been seriously ill with pneumonia.

MR. JOHN L. MERCHANT, secretary of the Employers Federation of Papermakers, has been re-selected by the Lords Commissioners of His Majesty's Treasury to act as public auditor for the purposes of the Friendly Societies Act, the Industrial and Provident Societies Act, and the Industrial Assurance Act, for the year 1925, for Great Britain.

M. LUCIEN ROMIER is relinquishing the editorship of the Paris *Journée Industrielle* to become the political editor of the *Figaro*. His successor as editor of the *Journée Industrielle* is M. C. J. Gignoux, who was secretary of the Economic Committee at the Paris Peace Conference.

MR. ALAN BRADLEY, erector to Messrs. Chas Walmsley and Co., has sent to the *Bury Times* a photograph of "a few Bury boys" who are in Newfoundland erecting the papermaking machinery for the Newfoundland Power and Pulp Co., Ltd., Corner Brook. The picture confirms the fact that five feet of snow had fallen.

A New Spicer Director.

Mr. Arthur Groves, manager of the Birmingham branch of Spicers, Ltd., has been appointed an ordinary director of the firm, following the departure of Mr. P. W. Kennett, and last week he attended his first meeting of the board. Mr. Groves joined the firm of James Spicer and Sons in Birmingham as a boy in 1879, and since then he has occupied most positions throughout the house, principally as a salesman. Although until the recent appointment he has spent the whole of

MR. ARTHUR GROVES.

his life in Birmingham, where he is one of the best known figures in the paper trade, he has made many trips abroad for his company, principally to Canada and the United States. When Mr. Groves joined the firm of Spicer and Sons, the staff at Birmingham was only twelve strong, and now there are nearly 100 persons engaged. Mr. Groves is regarded as a *persona grata* by both sides of the house of Spicer, and he is well known not only in Birmingham itself, but throughout the Midlands. He was a member of the golf club which was organised in connection with the paper trade of Birmingham and district, and in every way revealed the characteristics of a good sportsman.

FIVE-DAY WEEK.—Mr. Cecil Chisholm, the editor of *System*, writing in the *Daily Dispatch* on the advantages of the five-day week, instances the example of a printing firm in the South of England who work the scheme by opening each morning half an hour before, and closing each evening half an hour later than the ordinary time. This fully makes up the time lost on Saturday morning, and saves overhead costs in many ways necessitated by a Saturday start. "This house," he says, "assures me that the output in general has improved under the new system, the health of the workers has considerably benefited, and the new arrangement is popular."

Bemrose Jubilee Celebrations.

All those attached to the firm of Messrs. Bemrose and Sons, Ltd., assembled on Thursday, January 15th, in the Central Hall, Derby, to commemorate Brigadier-General W. Wright Bemrose's fifty years' association with the establishment of which he is chairman.

To General Bemrose, the employees—and there are over 700—presented an illuminated address and his portrait in oils by the gifted Derby artist, Mr. Ernest Townsend; and to Mrs. Wright Bemrose they gave a handsome pearl and diamond brooch set in platinum.

Those were not the only presents made; in fact, the handing over of presents was on such a scale as to suggest a Christmas party, for General Bemrose, on behalf of himself and his fellow directors, handed certificates and cheques to a number of employees who had served the company for fifty years. In his speech General Bemrose mentioned that no less than twenty-two of the firm's employees have already attained their jubilee; five others attain it this year, and seventeen others have more than 40 years' service to their credit—some of whom are exceedingly near to the fiftieth year limit.

Necrology

Mr. Philip H. L. Warner.

Mr. Philip Henry Lee Warner, publisher and enthusiast for fine printing, died suddenly at his residence, the Manor House, Bletchingley, Surrey, of influenza, on Wednesday of last week, at the age of 47. His publishing activities included association with Fisher Unwin, Dent's, Putnam's and Chatto and Windus. His taste and enthusiasm for fine printing led to co-operation with the late Mr. Herbert Horne, and the production first of the "Riccardi" type, and then of the "Florence" type, two of the most beautiful and readable of modern founts. The realm of colour printing also received his attention, and he founded in 1908, the Medici Society, well known for the "Medici" series of colour prints. He resigned in 1921 the managing directorship of the Medici Society, but soon afterthe war acquired control of the lithographic colour business founded at Peckham by the late Mr. William Griggs, and he also took over the Chiswick Press, and incorporated the two businesses under the title of Charles Whittingham and Griggs (Printers), Ltd. Two years ago he joined in founding the publishing firm of Martin Hopkinson and Co., Ltd.

Mr. Philip J. King.

A well-known figure in the paper trade of London has passed away in the person of Mr. Philip J. King, who for over 45 years was associated with the firm of Messrs. A. J. Brown, Brough and Co. His character and devoted service were greatly appreciated by his firm, and by customers whose confidence and respect he had won. Mr. King met with an accident some forty years ago, which had affected his health ever since, but he nevertheless applied himself to business with great assiduity.

"GOLDFILM" BLOCKING FOIL

(IN ORANGE, LEMON AND SILVER SHADES)

Made by an entirely New and Patented Process. A boon to all users of Gold Leaf, Foils, &c.

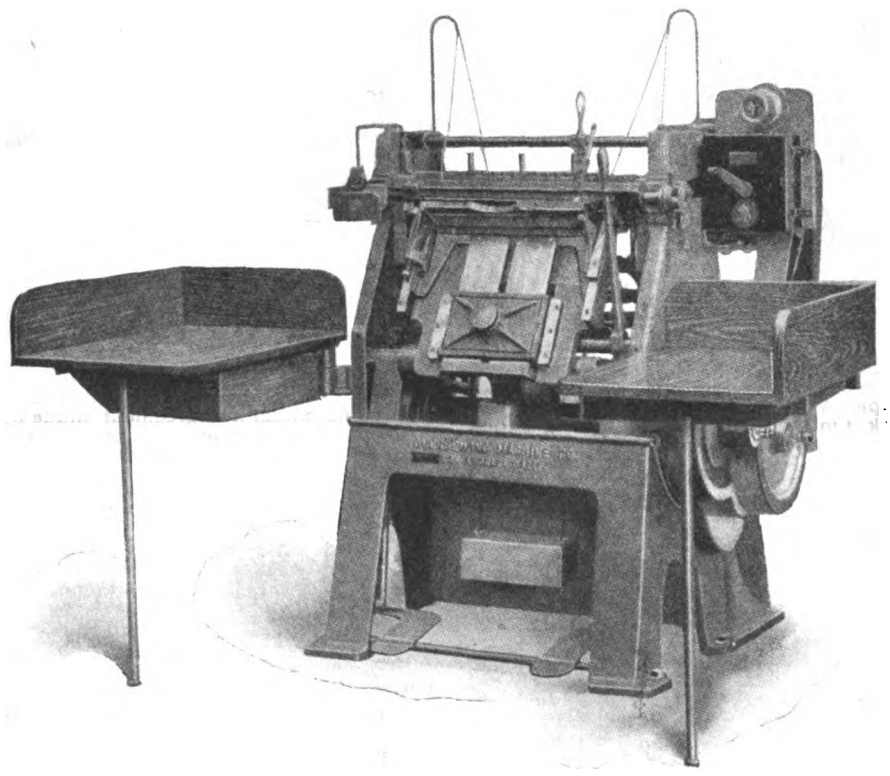
The Bookbinder

The Oversewing Machine.

We gather that a good deal of interest was aroused by an article that appeared in our issue of October 16th last on the subject of "Oversewing and Its Recent Development." In that article we recalled the use by hand bookbinders in the past of "whip stitching," "overcasting" or "oversewing." Oversewing differs from the more usual book-sewing mainly in that it is performed through the *sides* of the binding edges of book sections, instead of through the folds. An intimate hold is thus secured upon the individual leaves such as is not possible by any other kind of sewing. Some such method of making a strong but flexible job in the sewing together of sections has become increasingly needed in the development of the modern book, with the growing use of paper of poor quality. Naturally, therefore, the application of machinery to this operation has been engaging attention, and in the article mentioned we referred to the Oversewing Machine (made by a Californian house), which had recently been introduced into many American factories and was beginning to find its way into binderies on this side of the Atlantic. We learn that, as from January 1st of this year, the agency for this country has been obtained by the T. W. and C. B. Sheridan Co., Ltd., of 63, Hatton garden, London, E.C.1, by courtesy of whom we are now able to illustrate the machine.

Our illustration shows the machine as viewed from the front, where, it will be noted, there are two pedals for the operator's feet, whilst there is conveniently situated on the right-hand side the electrical control for the power drive—momentary starting and stopping being, however, effected by pedal action.

Operation of the machine is simple. The operator (seated on a stool) takes each book section from the left work table, passes it across the paster above, and feeds it on to the clamp shelf in front of her. Pressure on the right pedal sets the machine going. Clamping, punching and sewing are automatically accomplished, whereupon the machine rests for the next section. This the operator will have ready for immediate insertion. When the final section is sewed, the operator swings forward the clamp shelf on its hinge, draws the book out, and closes the clamp shelf upon the threads, thus severing them and releasing the book for stacking on the right work table.



Books must first be divided into sections of suitable thickness. If new material is to be sewed the folded signatures (well pressed) may be taken without further preparation; very thin signatures may be sewed two or more at a time. Likewise, new books, intended to be re-sewed, may be taken apart into their original signatures, and these oversewed without further preparation. Books for rebinding have their backs slightly (*very* slightly) trimmed in a cutting machine, are glued in tablet form, and are then divided into sections suitable for oversewing.

Books of any height up to 16⅛ inches and of any thickness up to 4½ inches may be sewed. To reset the machine for a different height of book it is necessary merely to add (or to remove) needles and punches to suit the intended size. This can be done very quickly. However, the best practice is to sort work, when possible, into lots of approximately uniform lengths, and thus obviate frequent resetting.

The forwarding of books sewn on this machine is in no way different from the forwarding of books oversewn by hand. A single caution is to be observed, namely, due to the fact that glueing the back of the book seals the sewing threads, this glueing must be carefully done with thin, hot glue, well brushed in.

The possible output of work from an oversewing machine is the number of sections that the operator can pass through the paster, feed into the machine and then remove therefrom in the form of sewed books, this final operation necessitating the opening and closing by hand of a hinged cutter-table once for each book. We are assured that an excellent operator will sew 400 usual volumes of fiction in eight hours, a good operator will sew 300, and a fair one 250.

The only disadvantage urged against oversewing (namely, that it somewhat restricts the opening qualities of a book), has been so largely overcome by improvements in execution and by effective "scoring" of stiff sections, that properly oversewed books are now claimed to be wholly satisfactory for all usual requirements. Support of this claim is found in the fact that public and school libraries are specifying oversewing for all their ordinary rebinding and for most of their periodical binding. The Committee on Bookbinding of the American Library Association in its latest report specifies oversewing for all such work.

Notes and News.

Improving Trade.

The general trend of trade in the bookbinding section of the industry continues to present a favourable aspect. There are many evidences that point to the fact that last year was a better one for the bookbinder generally than either of its immediate predecessors. This is especially the case from the point of view of unemployment. So far as London is concerned it may be stated that during 1921 the total out-of-work pay amounted to £17,234; in 1922 it had declined to £14,041, in 1923 it represented £8,197, and last year it receded to £5,067. From a glance at these figures it can safely be said that business is gradually and consistently showing signs of improvement.

Binding Price List.

The bookbinding section of the allied trades is not less troubled with the vagaries of the price-cutter than are other sections, and scientific costing methods have still a big field for application in the binderies of this country. If we are not yet within sight of accurately ascertained prices for every establishment, based upon its own particular conditions, it will at least be a help to have an official guide that can act as a rough check upon prices charged for the various classes of bindery work. This, no doubt, will be the useful function of the "Binding Price List," which the Costing Committee of the Federation of Master Printers has now in preparation. The list will, we understand, be submitted before publication to a small committee of Federation members who are engaged in commercial bookbinding.

Increased Cost of Binding.

What is the average increase in the cost of present-day bookbinding in this country, as compared with that of pre-war years? This knotty question is tackled by Mr. Stanley Unwin (head of the London publishing house of George Allen and Unwin) in writing for the New York *Publishers' Weekly* on "The Price

Digitized by Google

of Books in England." In respect of binding, as contributing to the total market price of the finished volume, he says, "It is difficult to give a fair comparison, for the increase in binding small numbers, from, say, 50-250, is vastly greater than it is in quantities of 1,000 and upwards. Roughly speaking, for small quantities the cost is more than double, and for larger numbers is about double the pre-war figure. That it is not more is probably due to improved machinery and the new plan of making a separate charge for warehousing stock, because the cost of the two principal items in binding, viz., 'Labour' and 'Cloth,' is about two and a-half times what it was."

Troublesome London Dispute.

In connection with the dispute between Messrs. Percy Jones (Twinlock), Ltd., and the Central London Branch of the Bookbinders' Union, we understand that an endeavour is to be made by a third party to explore the avenues of the dispute with a view of suggesting possible grounds of settlement. Both sides have agreed to the intervention of the third body, who, it is interesting to mention, are unconnected with the printing and allied trades.

Bookbinders' Overseers Association.

The annual report and balance-sheet of the Printing, Bookbinding and Kindred Trades Overseers' Association were presented to a very full gathering of the members on Tuesday at St. Bride Institute, Bride-lane. Both items showed evidences of the Association's continued progress. Mr. J. Fleming and Mr. Arthur Cox were again elected president and secretary respectively, whilst Mr. A. G. Aves—for many years the financial secretary of the Association—was elected vice president. Among the other appointments was that of Mr. J. A. Esler, as the Association's honorary technical adviser in succession to Mr. G. A. Eden, who has recently been removed to Manchester. An amendment to one of the Association's rules relating to unemployment was passed with only two dissentients. A fuller report of the proceedings will appear in next week's issue.

Charity Dance and Carnival.

The Gala Committee of the National Union of Printing, Bookbinding, Machine Ruling and Paper Workers are continuing their useful work. On Monday, February 23rd, a dance and fun carnival is to take place at the Shoreditch Town Hall in aid of the funds of the different trade charities. Mr. A. McLeod (the Gala secretary) will be pleased to give information regarding the event.

New Loose-Leaf Method.

Messrs. W. S. Hodgkinson and Co., the very old and famous hand-made papermakers of Wookey Hole Mills, Wells, have recently perfected a method of making loose-leaf ledger sheets with a naturally strong and flexible hinge in the place of the creased or crimped hinge applied to many types of ledger sheet. The chief objection to crimping is the swell that it imparts to the back of the ledger. It need hardly be explained that the purpose of the hinge or flexible portion close to the binding edge of loose-leaf sheets is to enable the leaves of the book to lie flat when opened. In other words, to counteract the spring or curve of the leaves which so greatly inconveniences the writer. There are American patents in which that portion of the sheets corresponding to the curve is treated chemically in order to induce extra strength and flexibility. Without any chemical treatment but by a natural construction of the mould, Hodgkinson's new production achieves the same result.

Loose-Leaf Sheet Sizes.

While on the subject of loose-leaf sheets, the demand for which is ever on the increase, it cannot but have occurred to most paper buyers that there is a dearth of information on the subject of sheet dimensions. Several of the larger makers of fine papers run a series of loose-leaf grades cut to special sizes, which are often inadequate in their scope. Strangely enough, it has almost been accepted as a custom that while ordinary ledger paper must be "laid" in texture, loose leaf ledger paper should be "wove." No doubt this is according to demand, dictated by the desire of the modern specialist to use something different. It happens in practice that while the loose-leaf ledger specialist fills the demand for ledgers, orders for subsequent supplies of refill sheets come along in abundance to the commercial printer and stationer. Ordinary standard grades of stock papers are required in loose-leaf sizes and very frequently there is difficulty in finding paper which combines the right size with the correct substance. In the ordinary way, as ledger paper increases its size, it increases its substance, a practice that will not stand the test of close reasoning. Loose-leaf ledger paper, on the contrary, is usually produced in uniform substances without regard to the ultimate size of the leaf. But if there is standardisation in this particular, it can hardly be claimed that the modern systematists have extended the same feature to cover the sizes of sheets used.

Marbling Paper by Machine.

We should be interested to hear from anyone with knowledge of a machine constructed to produce marble papers on principles very similar to those of the well-known hand method. Though general reference has been made in our pages to the use of such a machine in Holland, we are unable at the moment to find specific information on the subject. The machine we have in mind contains a vat with the colour-supporting liquid, the supplying and combing of the colours being effected by mechanical means, as is also the application of the paper, which is supplied from a roll and cut by the machine into sheets. Perhaps any reader able to assist in the matter will kindly communicate with the editor of this journal.

Binding Machine Wages.

At the recent quarterly meeting of the Federation of Master Printers it was reported that, in accordance with the decision of the Council, proposals had been made to the National Union of Printing, Bookbinding, Machine Ruling and Paper Workers on the basis of additions to the grade rates for binding machines of a character demanding special skill and attention. The proposal had not been acceptable to the Union, mainly because under the proposals the members of the Bookbinding Section in London (employed by the Bookbinding Section of the London Chamber of Commerce, who were book publishers' binders and were in competition with binders in the provinces) would receive a lower rate than members of the London Central Branch of the Paper Workers' Section of the Union who came under an agreement made by the London Alliance, and were mainly engaged upon the printing of periodicals in London. A differential rate for London had then been proposed, providing for a higher rate above the grade rate being paid in London than in the provinces; but this also had not been acceptable to the Union, who asked that the London binders should give further consideration to the question, with a view to offering rates in conformity with those obtaining with the members of the London Central Branch. The committee had opposed every suggestion that women should be excluded from operating these machine, and no suggestion was put forward that where women were working they should not be allowed to continue.

A Notable Zaehnsdorf Book.

A book of more than passing interest has just recently left the house of Zaehnsdorf.

Members of the Vacuum Oil Co. were desirous of paying tribute to a retiring director in New York. As he is known to be greatly attracted by the architectural beauties of our cathedrals, etchings, prints and photographs of all the Cathedrals of Great Britain, with Westminster Abbey, Lambeth Palace and St. George's, Windsor, were collected together to be made into a presentable volume.

Being of all shapes, sizes and tones, these appeared to offer an almost insurmountable problem in the obtaining of any uniformity of character, but when placed in sunk mounts of toned Creswick paper, the first semblance of cohesion was obtained. All the mounts were then signed by the Deans of their respective cathedrals. The name of each cathedral was written in semi-Gothic characters on each mount, and a title page, dedication page and several pages of contents were also written in these characters, giving a magnificent dignity to the book.

Each page was double linen jointed, and the whole covered in antique white pigskin with a decoration in blind, maintaining the Gothic character.

The book with its box, measuring about 26 by 22 ins. and weighing over 80 lbs., was a masterpiece of skill and good taste, a harmony of magnificence and dignity, worthy of both the subject and the object.

Bookbinders' Code of Ethics.

The Employing Bookbinders of America have lately shown a very proper concern for the uplifting of business standards in the bookbinding industry, and to that end are engaged in compiling a Code of Ethics, which, after discussion, possible modification and adoption, is likely to represent the principles of the Employing Bookbinders and to be recommended to all members of the Association. The following is the draft Code:—

1. The foundation of business is confidence, which springs from integrity, fair dealing, efficient service and mutual benefit.

2. Fair dealing is due in business, alike to your customers, your competitors, your employees and the public.

3. Contracts should always be made in writing. They should be simple in form and acceptance, with prices concisely expressed.

Avoid obscure language, unusual words, unnecessary clauses. They should be performed in letter and in spirit.

4. No bookbinder should make estimates on work that he cannot do.

5. No bookbinder should surreptitiously or by trick and device hire the help of his competitor with a view to rendering such competitor less efficient in carrying on business.

6. Every bookbinder should have a fair knowledge of what his actual *bona fide* cost is and what is a fair percentage of profit on all work that is done in his establishment. You cannot get every job on which you estimate—make your price based on known costs and a fair profit, plus a safe reserve, and stick to it. You will find your business on the whole will be more satisfactory and successful if you only do work on which you make some money, than operating at a loss with the hope some day of getting it back on future jobs—generally it is a blasted hope.

7. There is not one standard of honesty in business and another standard outside of business. If you practise bad faith, deception and fraud, you deserve the contempt of your customers and your competitors.

8. To continue to do business you must rely for its success on the excellence of your service and not on being tricky and smart and committing acts of fraud and commercial bribery.

9. Excesses of every nature—inflation of credit—over expansion—over buying of machinery and materials—wild scrambling for business regardless of price—are condemned.

10. Seek at all times to elevate the standards of the bookbinding industry by careful study of its problems, by rendering efficient service to the public, and by practising the ethical standards set forth in this code. Be enthusiastic in inspiring others in the business to do likewise.

Mental Tests for Apprentices.—The scientific examination of the mental fitness of apprentices in the printing industry has been made a compulsory test for admission to the Toronto Typographical Union, and in future no youth will be accepted for membership until he has passed a set of psychiatric tests. It is stated that no other labour union in the world has insisted on such mental tests for its future members.

Messrs. Jordan and Sons, Ltd., in their annual statistical report relating to new companies registered in England during 1924, indicate that 168 stationer companies were registered, with a total capital of £1,033,549; 58 newspaper companies, with total capital £8,152,750; 87 publishing companies, capital £614,450; and 94 advertising companies, capital £262,755. The newspaper companies included the *Daily Sketch* and *Sunday Herald*, Ltd., with a capital of £1,000,000.

In "Notes from Buyers" for January, Spicers Ltd. announce an essay competition, on "How I build up My Business," for printers and stationers. Emphasis is laid on the advisability of printers using better paper, the products of Sawston Mill being indicated. A warm invitation is extended to customers to make greater use of the firm's show-rooms in London and the provinces. Finally attention is drawn to some of the Spicer specialities, and a wide range of samples accompanies the "Notes," including writings, printings, coloured papers, wrappings, cards and cardboards, envelopes, etc.

The Manchester office of Messrs. Robt. Craig and Sons, Ltd., has been removed to 108, Portland-street.

DIVIDENDS AND REPORTS.

ABERDEEN NEWSPAPERS, LTD. — A final dividend is recommended of 1s. 9d. per share, making, with the interim dividend of 1s. 3d. per share, paid on August 1st last, 3s. per share (free of tax) for financial year ended December 31st, 1924. Final dividend payable on February 14th.

NEW COMPANIES.

E. HULTON AND CO., LTD.—Capital £100, in £1 shares; proprietors, printers and publishers of newspapers, journals, magazines, books, periodicals and other literary or journalistic works of any description, and to acquire the goodwill and copyright of and continue the publication of any existing newspapers, periodicals or other publications, etc. Private company. Subscribers: H. W. Hill and E. Newton. Registered office: 47, Shoe-lane, E.C.

C. D. LAWSON AND CO., LTD. — Capital £1,000, in £1 shares (500 "A" and 500 "B" ordinary); manufacturers of, agents for and dealers in art reproductions, prints, blocks for letterpress printing, printers, publishers, advertising contractors and agents, etc. Private company. First directors: C. D. Lawson and W. H. R. Askwith. Registered office: 19-20, Fetter-lane, E.C.4.

A. R. SIDDERS AND CO., LTD.—Capital £500, in £1 shares; to acquire the business of bookbinders now carried on by A. R. Sidders, at 35, Eliptan-street, Chelsea, as "A. R. Sidders and Co.," and to carry on the business of printers, stationers, booksellers, art dealers, etc. Private company. Permanent directors: A. R. Sidders, S. H. Sidders and S. B. Sidders. Registered office: 35, Eliptan-street, Chelsea, S.W.

INTERNATIONAL IDEAL ROLLER AND MANUFACTURING CO, LTD.—Capital £15,000, in £1 shares; manufacturers and wholesale and retail dealers in and importers and exporters of lithographic, printers' and other rollers, inks, dry colours and varnishes, bronze powders, typewriter ribbons, carbon paper, etc. Private company. Directors: C. I. Ferguson, F. Thompson and A. J. A. Kennedy.

MASON PRESS, LTD.—Capital £1,500, in £1 shares; proprietors, printers and publishers of newspapers, journals, magazines, periodicals, books or other literary or artistic work, etc. Private company. Subscribers: Henry Hess and Dora L. Carter. Registered office, 19, Devereux court, Strand, W.C.2.

THEATRICAL PUBLICATIONS, LTD. — Capital £2,000, in £1 shares; to adopt an agreement with A. E. Barwood, and to carry on the business of proprietors, publishers and printers of newspapers, journals and other literary works, etc. Private company. Directors: A. E. Barwood and T. W. C. Allworthy. Registered office: 35, Wellington-street, Strand, W.C.2.

MOORGATE PUBLICITY CO., LTD.—Capital £100, in £1 shares; advertising contractors and agents, designers of advertisements, manufacturers of, agents for, and dealers in advertisement novelties of all kinds, printers, etc. Private company. Directors: S. Coyne and Mrs. L. Coyne. Registered office: 30-2, Ludgate-hill, E.C.

W. AND M. WOODS AND FLEMING'S PAPER MILLS, LTD.—Capital £15,000, in £1 shares; to acquire the business of printers, lithographers, diesinkers, paper and paper bag manufacturers, carried on under the style of "H. and M. Woods," at High-street, Dublin. Private company. First directors: G. P. Fleming, R. J. Duggan, P. J. Walsh, V. Fox, B. C. McDonald, M. Molloy, and F. Tynan. Registered office: 40, High-street, Dublin.

E. MASH (1925), LTD.—Capital £2,000, in £1 shares; to acquire the business of timber merchants and importers carried on by E. Mash, Ltd., at 27, Church-street, Shoreditch, E., or elsewhere; to adopt an agreement with A. Binstock, and to carry on the same and the business of importers and exporters of, and dealers in, wood pulp, paper, cardboard and similar substances, etc. Private company. Subscribers: E. C. Mash and A. Binstock. Registered office: 27, Church-street, Shoreditch, E.2.

GUILFOYLES ADVERTISING AGENCY, LTD.—Capital £1,000, in £1 shares; advertising agents and contractors, printers, publishers, booksellers, etc. Private company. Subscribers: W. H. Guilfoyle and B. Young. Registered office: 179, Pearse-street, Dublin.

CRAFTS, LTD.—Capital £1,000, in £1 shares; manufacturers of and dealers in all kinds of advertising novelties in wood, metal, paper or other materials, art calendars, sports and games requisities, etc. Private company. Subscribers: W. Holt and W. E. Godfrey. Registered office: Reddicroft Works, Reddicroft, Sutton Coldfield.

PUBLICITY CABINETS, LTD.—Capital £1,100, in £1 shares; advertising contractors and agents, printers and stationers, manufacturers of all kinds of apparatus and appliances, plant and material employed by advertising contractors, etc. Private company. Subscribers: A. Fleming and Miss K. Grossman. Registered office, Bush House, Aldwych, W.C.

BRANSTON, LTD. — Capital £1,000, in £1 shares; advertising agents and contractors, artists, engravers, lithographers, etc. Private company. Directors: J. Skippers and E. R. Branston.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

FLEETWAY PRESS, LTD. — Satisfaction to the extent ef £2,500 on June 30th, and to the extent of £2,500 on December 31st, 1924, of B debentures dated July 28th, 1920, securing £58,200.

COMMERCIAL PRINTERS (HULL), LTD.—Debenture dated January 2nd, 1925, to secure £100, cnarged on the company's property, present and future, including uncalled capital. Holder: G. H. Wilkinson, Gibside, Hawkesworth-road, Horsforth, Leeds.

NORTHERN PRINTING CO., LTD.—Debenture dated January 6th, 1925, to secure £550, charged on the company's property, present and future, including uncalled capital. Holders: W. J. Dunns, 19, Ampthill-square, N.W.1, and others.

WHITCHURCH HERALD, LTD. — Particulars filed of £5,200 debentures authorised January 13th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

A. M. PHILPOT (PUBLISHERS), LTD. (London). —Particulars filed of £2,000 debentures authorised January 7th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

OSMIC CHECK BOOK CO., LTD. (Ealing).—Mortgage on Osmic Works and 127, Northcroft-road, Ealing, dated December 30th, 1924, to secure £5,000. Holders: North British and Mercantile Insurance Co., Ltd., 61, Threadneedle street, E.C.

BOYDEN AND SMITH, LTD. (stationers and paper merchants, etc., London).—Mortgage debenture charged on the company's undertaking and property, present and future, including uncalled capital, dated January 10th, 1925, to secure all moneys due or to become due from the company to the National Bank, Ltd.

RECEIVER APPOINTED OR RELEASED.

SALE STATIONERY CO., LTD. — T. Shaw, of 1, Princess-street, Manchester, ceased to act as receiver or manager on December 31st, 1924.

"British Waste Paper."

Action Over a Company's Name.

An action, Hawkes *v.* British Waste Paper Co., Ltd., was mentioned to Mr. Justice Romer in the Chancery Division on Wednesday, on a motion by plaintiff for an injunction restraining the defendants from carrying on business under any name of which the words "British Waste Paper" formed part.

Mr. Morton, for plaintiff, was about to read an affidavit, when

Mr. Bischoff (for the defendant company) said that they went to considerable trouble to find out whether the name they adopted belonged to anybody else. They did, in fact, offer a selection of names to the Registrar under the Companies' Act, and neither he nor the defendants could trace any company or business that was being carried on under the name they adopted. The name was not in any directory or the telephone book but it was in the Register of Business Names. It was obvious, therefore, that the defendants could not continue to carry on under the name, and he was prepared to give an undertaking until the trial in the terms of the notice of motion.

Mr. Morton said he would accept this, and the motion was adjourned accordingly, the costs of the motion to be costs in the action.

Merton Board Mill.

In the Companies Winding-Up Court last week the petition of the Sturtevant Engineering Co., Ltd., for an order for the compulsory liquidation of the Merton Board Mill, Ltd., was before Mr. Justice Romer.

Mr. Byrne, for the petitioners, said the petition had been adjourned for six weeks for some arrangement to be made. He understood that all the creditors were willing to fall into line with regard to a certain course, but in the case of one creditor a little further time was needed to complete the arrangement. He asked for the petition to stand over 14 days.

Mr. Spens (for the company) agreed and Mr. Swords (for the creditors) did not oppose.

The petition therefore stood over for 14 days.

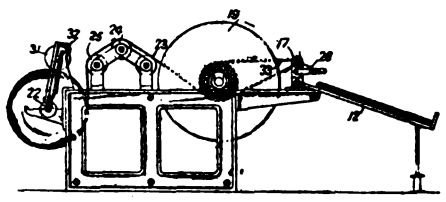
New Inventions

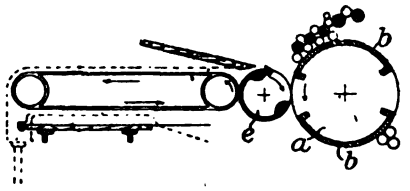
A Bookbinding Invention.



A machine for "marking up," or forming "blind lines" across, the backs of book covers, as patented by Mr. F. E. Blunt, comprises one or more rotatable, circular tools *b* against the peripheral edges *c* of which the back of the book cover is pressed. The tools *b* may be adjustably and interchangeably mounted on a rotary spindle *a* to vary the type of "marking up" and are heated by means such as gas jets or by friction with the cover. The spindle *a* is detachably mounted in the frame *g*, one end of the spindle being carried by a screwed or otherwise withdrawable bearing *h* and the other end engaging a driving extension *j* through a socket *i* and feather *k*. The book

is supported on, and raised and lowered about, a roller *m* and is positioned against an eccentric disk *s* or other stop The ends of the roller *m* are supported in radius arms *n* and carry screwed pintles adjustably locked in curved slots in the frame *g* by nuts *r*. The tools *b* are cleaned by a pad *e* mounted at its ends in swinging arms and means may be provided for greasing their edges *c*. The Provisional Specification refers to a spring support for the rotary spindle to accommodate irregularities in the cover.

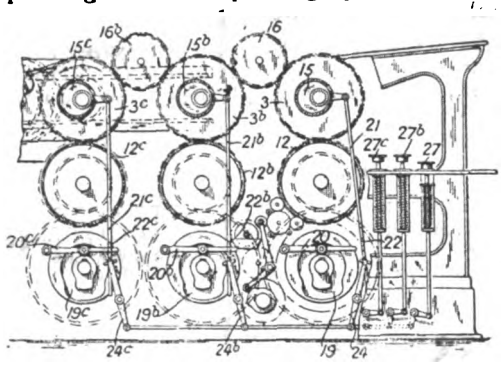
Collecting Sheets in a Pile.



In this invention in means for collecting in a pile printed sheets, which have been rolled up in a web in order to keep them damp, the material of the web itself is used to prevent dropping of the sheets as the web is unwound, and to convey them to a stripper by which they are deposited on a collecting shelf. The web containing the sheets passes from a

supply-roll 19 over a guide-roller 17 of small diameter, and then beneath the supply-roll itself, and over guide rollers 23, 24, 25, to a winding-roll 22. As the web passes over the roller 17, the sheets are stripped off by stripper fingers 28, and delivered to a shelf 12. The passage of the web beneath the supply-roll tends to prevent the sheets from leaving the roll, and carries a separated sheet upwards so that it may be placed by hand on the shelf 12. A weighted roller 31 bearing upon the winding roll 22 is guided in slots having an off set portion 32, for supporting the roller out of contact with the winding roll. The patent is in the name of the American Bank Note Co.

Rotary Printing Machines.



A rotary printing machine, patented by Mr. R. Horn, is provided with lithographic printing plates of rubber, linoleum or other supple non-metallic material. The cylinder *a*, Fig. 1, is provided with one, two, or more rubber plates *b* on which the design is produced by passing an inked zinc plate or other original between the cylinder *a* and impression cylinder *e*. Prior to receiving the design, the plates

b are roughened and treated with acetic acid. For perfecting, the cylinder *e* may have an offset blanket and receive a sheet at alternate revolutions. In a web-printing machine, two printing cylinders may coact to print simultaneously on both sides of the web passing between them.

Multi-Colour Printing Machines.

A multi-colour rotary printing machine, patented by Mr. H. G. Rogers, of the kind comprising a number of printing cylinders 12, 12^b, 12^c, impression cylinders 3, 3^b, 3^c, one co-operating with each printing cylinder, and

transfer cylinders 16, 16^b, between the impression cylinders, together with eccentric means for moving the impression cylinders into contact with the printing cylinders at the commencement of each impression, and out of contact at the end of each impression, is constructed so that the eccentrics 15, 15^b, 15^c are operated from cams 19, 19^b, 19^c, on the printing cylinders through trip mechanism comprising tappet levers 20, 20^b, 20^c which in their operative positions engage holes or forks 22, 22^b, 22_c, in rods 21, 21^b, 21^c connected to the eccentrics 15, 15^b, 15^c. The tappet levers 20, 20^b, 20^c can be disconnected from the rods 21, etc., by means of pedals 27, 27^b, 27^c connected separately by levers and links to levers 24, 24_b, 24^c, capable of moving the forks 22, etc., out of engagement with their operating levers. The machine may be constructed with any number of printing couples. Specification 215,825 is referred to.

New British Patents.

For the benefit of our readers we have arranged for any inquiries relating to Patents, Designs and Trade Marks to be answered, free of all charge, by a Fellow of the Chartered Institute of Patent Agents. Inquiries should be addressed, in the first instance, to the Editor.

STREAMAX.

454,239. Paper (except paper hangings). The Stream-line Filter Co., Ltd., 64, Victoria-street, London, S.W.1; filter manufacturers.—December 4th, 1924.

Paper Mill Directory.

The 65th annual edition of "The Paper Mills Directory of England, Scotland and Ireland" makes its welcome appearance with the New Year. Published by Messrs. Simpkin, Marshall, Hamilton, Kent and Co., Ltd., London, it retains its customary handy form and its familiar brown cover. In addition to showing the mills of the United Kingdom in alphabetical, numerical and geographical order, the titles of the mills are also given. Then there is a list of paper enamellers and surfaces, a classified list of papers, and an enumeration of London wholesale stationers. An important section of the book is devoted to watermarks and trade names, together with the addresses of the firms referred to. Finally the membership of the Papermakers' Association is set out in detail, and there are particulars concerning other trade organisations.

Stationery in the Transvaal.

Anxiety Regarding New Tariff.

A deputation of the Transvaal Stationers' Association recently met the Supervisor of Customs at Pretoria and discussed with him various stationery matters having reference to the Customs duty changes thought to take place in the early future. The deputation pointed out that it would be unwise to classify certain things as falling under the full duty as printed matter for the reason that at the present time they either could not be manufactured in the country, or, where such might be possible, they could only be made at uneconomic prices by the narrow demand in the conntry at present.

In the matter of account books and certain ruled stationery, they submitted that there was no real trade factory in the Union expressly catering as suppliers for the retail trade; that such houses as did in some measure manufacture stationery were themselves also retailers competing with the ordinary retail houses; and that, further, the local manufacturing conditions, together with the restricted demands in the country, did not permit of these articles being produced locally at economic rates. A promise was given that careful consideration would be given to the views expressed when the tariff came to be decided.

COMPOSITORS' HANDBOOK.—Working compositors and many others besides will find it useful to keep at hand a copy of the "Compositors' and Printers' Handbook," published by the London Society of Compositors at 7-9, St. Bride-street, E.C.4. Priced at 6d., this booklet is good value for money, containing as it does a variety of useful features. A calendar and a diary are followed by many tables of great utility for calculating prices of composition; there are instructions and numerous diagrams on the subject of imposition and in addition to other reference matter the booklet contains several original articles including "The Costing System" (by E. Pheby) and "Shape Hints for the Lay-Out Man" (by H. B. Naylor).

THE TRIUMPH OF Modern Offset Lithography

By JOSEPH GOODMAN, F.R.P.S.,

City and Guilds of London Honours Silver and Bronze Medallist, Lithography and Photo-Mechanical Processes. Author of "Practical Modern Metalithography," etc.

It may be interesting to refer here to the additional facilities open to the offset printer in providing extra features in the range of engraving work. To that end we may briefly describe how arbitrary tonal values may be imparted to the work, by a careful manipulation of etching in tone stages.

Engraving and Etching Images for Offset.

The mode of procedure in the etching of the plate in tone stages is by first etching for the finest parts, from about a half to two minutes, according to the grade of the lines and tone-values of the image, next stopping-out these finest parts with asphaltum resist composition, and pursuing the etching for the next grade of tone; then repeating this procedure until all the gradations are produced, as in copper etching. This tone etching may also be done without the preceding stopping-out operation, by conducting the etching of these various gradations with a brush, as when vignetting on copper, or etching machine engraving on stone.

Alternative Process.

We now proceed to describe an alternative process without intaglio etching. After the plate has been thoroughly etched with the non-corrosive etcher and washed, it is coated with ordinary water-colour black (ivory or lamp black), and the engraving work executed with the usual engraving needles until the lines have been scratched through the oxidised layer, bearing the unoxidised metal underneath. Linseed oil, greasy ink, or a mixture of draughtsman's ink and turps (not dissolved in water) is then thoroughly rubbed into the incised lines, the plate afterwards being washed out and rolled up.

Reversing from Right to Left View.

This is a process by which any design drawn facing the left, can be utilised for a right-view image, and *vice versa*, so as to form a pair of pictures with opposite views. This will be more extensively used in the future, on account of its service to the rubber offset machine, as the offset process makes it necessary that all work which has been drawn or engraved for the direct method has to be reversed. The old method of effecting this reversal was by pulling a transfer of the original on re-transfer paper, then placing upon it a sheet of clean transfer paper, and pulling them through together under pressure, when, after separating them, the right and left images were found on these two sheets. As much more delicate work has to be done now, for these machines, it becomes imperative to adopt a better method for reversal work.

Zinc for Re-transfer.

This can be done by using very thin, supple sheets of zinc instead of transfer paper for taking the re-transfer from the original, and then using this thin zinc, as the real original from which the transfers for the printing plate will be made. The original must be rolled-up well with re transfer ink, and the pressure accurately adjusted; the prepared surface of the thin zinc plate is then laid carefully upon the rolled-up original, taking care that no lateral movement occurs. The backing sheet and shalloon board are then applied, and the impression made. On the plates being separated, the thin zinc plate is prepared in the same manner as an ordinary transfer, and becomes the actual original from which the transfers are pulled for patching up and transferring. Thus it will serve for the old and new method, and produce immeasureably better results than can be obtained from transfer paper reversals.

Transposing from Black to White.

Similarly with "negative" and "positive" images: by this method black lettering is made to appear white, whilst the background surrounding it is dark or coloured as required; or the lines of a picture may be made to show white, whilst the background is black. For special classes of work this is a great advantage, as it gives a stronger emphasis to the illustration and changes the character of the images. There are many ways of producing this on the zinc plate. The following methods, however, will probably be found the simplest and best.

Transposing—Method No. 1.

The plate is etched with the non-corrosive etching solution, gummed, fanned dry, the gum washed off and the plate again dried. Then a transfer is pulled from the original on transfer paper (such as oak varnish transfer paper), which leaves only the transfer ink and no coating on the plate. Use transfer ink with a mixture of good black ink. The transfer is laid in position, and the plate pulled through the press in the ordinary way. Remove the paper without using water, and powder the dry plate with resin, which is afterwards wiped over with French chalk. The layer of resin must now be melted by heating the plate until the drawing appears in sharp outline and in a deep, shiny black, the heating being effected either from underneath or from above by means of a spirit blow-lamp. Care must be taken not to overheat the plate, overwise the lines of the drawing will spread. The plate is cooled by the application of water at the back, and the powdering and heating process repeated. Any dirt is removed by means of a wood pencil and dry pumice powder, or a scraper. The plate is then immersed for from one to two minutes in a re-sensitising bath and rocked, or the re-sensitising solution may be applied with a brush or soft sponge. After the plate has been washed clean and dried, it is coated with lithographic writing ink. When the ink is dry, wash out with turpentine and water;

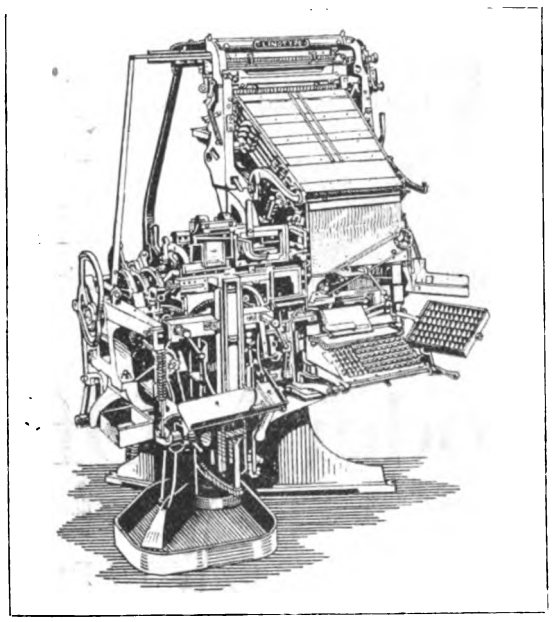
THERE ARE TWO DISTINCT MODELS OF

TRADE LINOTYPE MARK

COMPOSING MACHINES

Model 4



WITH OR WITHOUT SIDE MAGAZINES

The machine as illustrated has a range of 5 to 36 point, and all faces can be set from the single standard keyboard. Mould and magazine changes can be effected in a few seconds. This model can be installed with three magazines only, and the side magazine section for extra large display added to the machine at a later date.

Model 6

WITH FOUR MAIN MAGAZINES

This model is recommended to those printers whose work requires a wide variety of type faces (roman, italic and display) in one and the same line. The standard magazine equipment provides four full size magazines, any adjacent two of which can be used together. Ordinary composition can be set on this machine as readily as on Model 4.

Further Improvements:

Vice Jaw Quick-change Device
Improved Pie Chute
Assembler Shaft Drive
Magazine Escapement
Large Metal Pot
New Pot Mouthpiece
Magazine Link Motion
Dual Side Magazines
New Design Display Matrices
Assembler Light Fitting
Keyboard Lock
Sight Measure Gauges
Automatic Magazine Change
Elevator Safety Device
Blank Slug Vice Lock
Double Pump Spring
Improved Mould Wiper
Electric Pot Heater

then roll in, when the reversed image will appear as clear and sharp as the transfer was.

Transposing—Method No. 2.

The prepared (sensitised) plate is coated with a thin layer of light-sensitive asphalt. This operation is conducted on a whirler, in order that the asphalt may be uniformly spread. When the plate is dry, the drawing is transferred on to it, in deep black ink, the opacity of which may be increased by dusting over with bronze powder, and the plate exposed to sunlight for from one to four hours. In order to find the proper exposure for the plate, it is advisable to transfer a small portion of the drawing at the side of the plate, close to the edge, and use this as a test piece for the exposure. When the development of this test piece shows the exposure to be correct, the plate is developed in a turpentine bath, or with cotton wool soaked in turpentine or lavender oil. It is not advisable to rub one portion of the plate repeatedly, otherwise the lines of the drawing may be thickened. Should there be any sign of this thickening, it is best to allow the plate to dry thoroughly, and commence developing afresh. When the drawing appears sharp and clear, the plate should be washed under a tap turned on full, and etched with a solution of nitric acid (one part) and water (fifty parts). Wash this off, fan the plate dry, etch with the non-corrosive etcher for four to five minutes and finally gum.

It has been found to be beneficial to add a few drops of a good wash-out tincture (asphaltum) with the ink when transferring for this process.

Continental Printing.

By Mr. J. R. RIDDELL

(Principal of the London School of Printing).

To an inquiring and impressionable mind nothing is so interesting and instructive as seeing at first hand the industrial systems and business methods operating in other countries. In my case, I looked forward with the keenest anticipation to visiting the Continental schools where printer-craftsmen are taught and trained. My expectation of seeing much and learning much has been fully realised, although I feel compelled to say that I was more than once disappointed and found that many matters of interest did not prove so valuable as I had been led to expect. I can, however, confidently say that the time was profitably spent. Seeing other people's methods of producing work, work which in many cases has called for the admiration of the printing world, has given me food for thought and suggested many new ideas.

Whilst it would not be possible to put every system into operation in this country, certain methods could be adopted which would enable good work to be produced more economically.

It may be that, instead of hours, I should have spent days in the places visited; but perhaps the technical mind and trained eye of the practical printer is able to see more in a limited time than would be possible in the case of one not having the same practical and technical experience.

High Standard of Colour Printing.

Speaking generally, the printing done on the Continent is of a high standard, particularly in relation to colour. In the printing produced for the industries of the various countries one can clearly trace the temperament of the people of each particular nation.

Germany, in particular, is producing the highest grade work. There is a technical excellence in their productions, especially in colour printing, which is above the average obtained in other countries, including our own. The design of a piece of work may not appeal to the ideas of other peoples, but the technique and high quality of the production cannot be denied. In my opinion, this is largely due to the thoroughness so characteristic of the German. Less output in a given time, however, is probably the result.

Their thoroughness is most manifest in the organisation and equipment of the workshops. Cleanliness, order and good working conditions, particularly in relation to temperature and light, are marked features of most German printing offices. Further, there appears to be a keen inclination to adopt new methods of reproduction, particularly by the aid of photography. Large offices, many employing over 1,000 workers, are generally able to produce work by all methods.

German Offset Development.

Eagerness in experimenting with new processes is shown by the development of offset printing on the Continent, where the web rotary offset press is frequently utilised for printing magazines and supplements to newspapers. This method is quite in its infancy, being invariably used for the production of the lower class of "weekly." A soft atmospheric effect is given to the illustrations when printed on a rough paper which cannot be obtained by any other process. As previously mentioned, there are various methods of "making up" machine plates, all of which have certain advantages, but ultimately scientific photographic methods will be adopted.

The Germans are particularly keen on photographic processes, and are anxious to obtain all the information in relation to what is being done in this direction in Great Britain and America. They are also extremely industrious, and seize every opportunity to keep their machines running. For instance, some years ago, it was the custom to have a lengthy lunch time (1½ to 2 hours), but now the machines invariably stop for half an hour only. The workers take their lunch sitting by the machines and leaving off work early in the afternoon. This effects a saving in lighting, but the short break cannot be good for the men and women. Again, many firms are adopting the two and even three-shift system during the twenty-four hours. A number of new methods were seen in operation, all of which seek to reduce the cost on the one hand and improve the result on the other.

Offset Printing in France.

The French printer is likewise making great strides in offset printing, and some splendid examples of work were seen. There, also, new processes are being developed in connection with the reproductive arts. One firm is making a feature of photographic offset colour reproductions of the highest possible standard. The manager responsible for the work is an "artist craftsman," and, by his method of work, he obtains results equal to the finest colour collotype reproductions. The work is entirely done from original plates and the prints obtained from a "Baby Rotary Offset Press." It has not been my good fortune previously to see such exquisite examples of offset printing as that produced by this firm. It is not to be wondered at that they are inundated with orders from artists, galleries and museums!

In Belgium, I saw very little of outstanding merit, and the organisation of the offices—with one exception—leaves much to be desired.

In Holland, as is to be expected, some good work—heavy in character—characteristic of the Dutch people is produced. The Dutch atmosphere was a sedative to the tired nerves of one making a hurricane tour through the printing centres of Europe.

In the production of magazines and weeklies, Germany may be said to be leading, with France a good second. France is in advance of Germany in newspaper work, especially in make-up and advertisement display, but nowhere did I see the same excellence which characterises the newspapers of our country.

The people on the Continent are applying themselves very closely to work, particularly the Germans.

Training the Craftsman.

In view of certain glowing reports on the Continental education for printers, I was disappointed with the schools. Making some allowance for national pride and prejudice, I did not see one technical institute where the work done could compare with our own technical institutes for thoroughness and results. Probably this is due to Continental people viewing technical training from a standpoint different from ours.

Most of the technical schools on the Continent are conducted on similar lines to our own junior technical institutes. The main object seems to be to take boys from the elementary schools and prepare them for the workshop. There is no guarantee, however, that they will get employment when the course is completed. No doubt this is due to the lack of the apprenticeship system as in operation in this country.

The students can attend without payment of fees, and in certain cases grants are given to the pupils. A number of boys are sent to the schools, after entering the workshop, by their employers; but, generally speaking, I did not find that the printing technical school was looked upon with any degree of respect.

In Germany the school buildings are inspiring externally; but within there is a decided dulness in the class rooms, and, as I gathered, little or no "soul." The teaching is somewhat academic, and there is little co-operation between the schools representing the various branches of the industry. In my opinion, this is fatal to the best results being obtained. There have been talks of co-ordinating the existing schools, but little or nothing has been done to reach this desirable end.

My sympathies are entirely with the students, who have to submit to conditions which, in my estimation, do not help to make men of resource or initiative.

One large school in Leipzig has a staff of professors and technical workers, each one being a reputed authority on some section of the printing industry. The particular object seems to be to introduce people into the printing crafts by means of a preliminary course of instruction so as to enable them to teach the printer "how to print."

There is general lamentation that no money is available for education, but, so far as I was able to form an opinion, much of the money could be employed to better advantage. Whilst the average course of instruction given in the schools may provide a person with superficial knowledge of a general character, I doubt whether the information so obtained could be applied in a commercial printing office.

A Notable Establishment.

In France, the Ecole Estienne seems to attempt to make a boy an artist before he is a qualified workman. The school is a good illustration of the lines on which a technical school should be run. It includes every section of the industry, and provides facilities for producing a piece of work from start to finish, within its walls and under one directing mind. The work done can be taken as fairly representative of French taste and temperament—particularly so in the bookbinding departments.

In Belgium, there are schools for the various sections of the industry, but, here again, they are all more or less working on individual lines rather than uniting to give a course of instruction which would make the average printer a better craftsman in the workshop and set up a national style. In the lithographic school in Brussels a diploma is granted on the results of an examination. The student taking the highest place is made a burgess of the city.

There is one thing for which I am devoutly thankful, and that is that we in this country have not yet adopted the Continental Sunday, so far as technical education is concerned. Most of the schools have their best attendances on Sunday mornings. In Brussels, a guild of letterpress printer journeymen have installed a printing plant for the encouragement of good printing, and are turning out some excellent work. Grants are obtained from the State and Municipality.

Utrecht to the Fore.

The school in Amsterdam is doing very useful work, while that at Utrecht is an ideal institution for teaching typography.

Mr. Riddell's report to the London County Council on his recent visit to the Continent has been reprinted in booklet form at the request of the Advisory Council of the London School of Printing for circulation amongst the members of the executives of the associations who are contributing to the funds of the School. From this booklet the above is taken.

It is self-contained, and includes every section of the craft, including photo-engraving. This particular school produces its work in a style which can be claimed as national, and is doing it exceedingly well. An exceptionally well produced school paper is issued monthly.

Two features of the Dutch schools which may theoretically appeal to one are the three years' preparatory course before entering the workshop, and the separate workshop for each grade of students. In my opinion, in the first instance, a great risk is run in allowing a boy to devote three years of his life in preparing for a trade which he may never be able to enter; and, secondly, the separate workrooms cannot be an economical proposition, nor the best preparation for boys to enter works.

The Continental schools and their work proved an interesting study. Although there are larger and more imposing buildings than our own, nowhere was there found the extensive plant, the large enrolments, and the activity and "spirit" which have made the London School of Printing and Kindred Trades an outstanding institution amongst those who cater for the requirements of those engaged in the printing and allied crafts.

No survey of the methods of technical training on the Continent would be complete without visiting the famous schools in Zurich, Munich and Vienna, and I trust it will be possible some time in the near future to visit these places and obtain first-hand information in relation to their system of teaching and methods of reproduction.

Nowhere on the Continent did I find a range of type faces equal to those in general use in England.

In Germany there is a craze for trade marks of fantastical design. I sincerely trust the fad in its German form will not spread to Great Britain.

These are but a few of my general observations, but if anyone is interested in any particular matter and desires further details, I shall be pleased to give any information in my possession.

Matters Worthy of Attention.

In regard to the work executed in the various printing works and schools on the Continent, I consider the following especially worthy of attention.

New photographic processes (direct and copying).

Methods of making-up formes for offset printing.

Composing machines for photographic reproduction.

The rotary web offset press for periodicals and newspapers.

Offset printing on letterpress machines.

The organisation and layout of printing offices.

The need for large technical institutes to be self-contained, with a view to creating a national style of work and obtaining the best results.

The desirability of arranging classes for those engaged in the printing and making of paper-containers (rigid and folding box-making). Continental firms are ahead of us in this work.

Opportunities for arranging exhibitions of things of interest to printers, and facilities for showing and demonstrating new methods of reproduction at the London School of Printing and Kindred Trades. This would help to make the school the centre of the printing industry in Great Britain.

In conclusion, I desire to express my appreciation of the courtesy which I received from the people I met on the Continent. Each seemed to vie with the other in making my "lightning tour" as profitable and enjoyable as possible during the short time I had at my disposal. The opportunity of making and renewing friendships will long remain in my memory, particularly the renewed acquaintance with a one-time instructor of Saint Bride Printing School, who now holds an important position in the printing trade in Germany.

It was pleasing to learn that the work of the London School of Printing (or "St. Bride" as it is generally referred to) is so well known and held in such high esteem on the Continent. It was, at times, rather embarrassing to one's modesty to listen to the views held of the School and its work. Frequently I was asked to address meetings of printers, but, after one attempt with the aid of an interpreter, I was left in such a state of mental exhaustion that it was not possible to undertake an otherwise pleasant duty as often as requested.

How Stamps Are Printed.

Mr. Fred J. Melville Tells of the Processes Employed.

Not the least notable of the fine series of technical lectures arranged by the London Central Districts Master Printers' Association was the one delivered at Stationers' Hall on Wednesday of last week, by Mr. Fred J. Melville, the well-known authority on philately. The chair was taken by Mr. R. A. Austen-Leigh, M.A. (vice president of the Association and past president of the L.M.P.A.), who was supported by Mr. W. J. Boyle (hon. secretary). There was a very good attendance, including a number of representatives of important firms connected with security printing. A few names noted were: Lt.-Col. Willis (head of the Indian Government printing office), Mr. O. G. Poulson, Mr. G. C. Griffiths, Mr. G. W. Young, Mr. G. Poulton, Mr. W. Whyte (secretary, L.M.P.A.) and Mr. J. Johnson (organiser).

A notable feature of the occasion was an exhibition in the large hall of many interesting items relating to stamps and stamp printing. A unique sheet of penny black imperforate stamps was shown by Messrs. Perkins, Bacon and Co., Ltd., whose exhibit also included a proof of the original die of the first postage stamp, 1840, and proofs, stamps, dies, etc. Messrs. Pictorial Machinery, Ltd., showed some fine examples indicating the value of the Lithotex Step-and-Repeat machine to stamp printers. Messrs. de la Rue's exhibit included Air Mail stamps and design, and the first surface printed stamp of the British Government. Messrs. Grover and Co., Ltd., the makers of the British stamp perforators, exhibited a complete punch box for perforating, consisting of the pin plate carrying the pins or punches; the guide plate, called the "stripping" plate, drilled with holes to guide the pins into the die plate. Messrs. Thomas McDonald and Sons (Engravers), Ltd., showed engraved plates, rollers and dies. Other exhibitors were: Messrs. Harrison and Sons, Ltd., Chas. Skipper and East, Ltd., W. R. Royle and Son, Whitehead, Morris, Ltd., Somerset House, and Mr. Fred J. Melville.

After a brief introduction by the chairman Mr. Melville was called upon for his lecture, which was followed with the closest interest throughout. We report the lecture in another column.

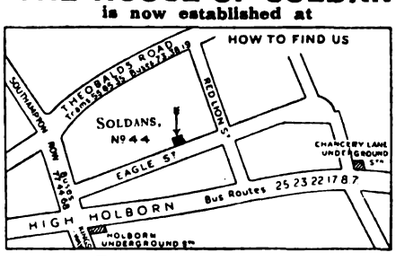
At the conclusion of the lecture, the chairman remarked that Mr. Melville had shown himself a master of his subject. Mr. Austen-Leigh went on to comment upon many of the points raised, taking the opportunity to dwell upon the demand for the restoration of penny postage, and referring humorously to the recent frequent changes of Postmaster-General and the repeated efforts of the printing industry to obtain the postal reforms so much desired.

In the course of questions and discussion Mr. G. W. Young queried the date of the earliest introduction of adhesive stamps in this country, and also referred to the use for stamp printing of paper containing silk.

Mr. Colebrook, in making a few interesting remarks, suggested that Charles Knight was a great man to whose work hardly enough attention is paid.

Replying, the lecturer said that prior to 1840 there were no stamps used other than impressed marks. The silk thread paper referred to was a very interesting invention by John Dickinson. The paper embodied silk threads of various colours, and in the manufacture of the paper these threads were worked in so that certain colours should appear in pre-determined arrangement on the front and back of the paper. The Mulready envelopes were printed on it, also certain embossed postage stamps, but the introduction of perforation made it impossible to use anything like continuous silk threads in the paper.

Stamp Printing for India.



Colonel Willis was called upon to move the vote of thanks, and in doing so referred to the taking of the Indian postage stamp printing away from this country to India. He said his reason for having the printing done in India was not that he expected or even hoped to do it better than it had been done in this country. After touring practically every country in Europe, observing their methods and studying their stamps, he came to the conclusion that there was not the slightest doubt that the best stamp printing in the world has been and still is done in England. Referring to the difficulties occasioned by the Indian conditions of extremes of temperature and humidity, Colonel Willis said they had found that, quite apart from the question of gumming, the paper itself curled without any gum on it. As regards the processes employed for stamp printing, he said he thought offset lithography and photogravure would fail, because of the grain used. In printing a portrait on a very small scale, even the variation of grain could produce a very noticeable change of appearance in the portrait. He had noticed examples of this in stamps bearing the head of King Fuad of Egypt and of the King of the Belgians. After considerable study, and reference to a great number of people, he had decided in favour of the letterpress method of stamp printing as used in this country. He would prefer recess printing, regarding which he was entirely in agreement with Mr. Melville's opinion that it gave the finest stamp, but it was very expensive and it complicated the problem of perforation, owing to the necessity of damping. He moved a very hearty vote of thanks to the lecturer.

The vote was ably seconded by Mr. Percy W. Ryde, F.R.G.S., who referred appreciatively to the lecturer's exact knowledge and his clear presentation of his subject.

The vote of thanks being enthusiastically received, Mr. Melville briefly replied, and in doing so expressed his thanks to those who had so cordially responded to the invitation to contribute to the exhibition of plates and specimens.

Expression was also given to the meeting's thanks to the exhibitors.

Postage Stamp Printing.

By FRED J. MELVILLE.

The printer had a share in the great postal reform of 1840 which gave us the postage stamp. It was largely due to the activities of Mr. Charles Whiting, of the Beaufort House Press, and Mr. Charles Knight, the publisher, that the proposals of Rowland Hill and others were formulated and given publicity. Their early proposals for stamps were more directed to envelopes and wrappers than adhesive postage stamps, and even up to the actual issue of stamps Rowland Hill pinned his faith to the envelope and wrapper, and was more than a little astonished—even disgusted—that the public took the tiny adhesive stamps at once to their hearts, and left the elaborate Mulready envelopes and wrappers to be scrapped.

When uniform postage had been approved by Parliament in 1839, the form the stamps were to take was still undefined. The Treasury invited suggestions from "artists, men of science, and the public in general," offering premiums of £200 and £100 for the best proposals. Of four premiated proposals Mr. Whiting's was one, and out of the many suggested stamps of this period it may be interesting to record that by far the most practical and most numerous of those handed down to us dealt with that interesting process known as compound plate printing, or compound plate printing combined with embossing.

Compound Plate Printing.

Compound plate printing is used for printing the patent medicine duty stamps at Somerset House, where the process has been in constant use for over a century. Although I shall take it for granted that you are familiar with most of the processes dealt with in stamp-printing, it may be that comparatively few printers to-day have seen the Congreve compound plate printing in operation. The patent medicine stamps printed in black and red at a single operation are familiar enough not to require description. The black plate is a brass plate on the upper level where the black ink rollers pass over it; below is a rising table on which is the red plate, between which and the upper plate are the red rollers. Both plates being inked, the table is raised, the red plate fitting into the open parts of the black plate at the moment of taking the impression.

The plates for this process are of an intricate and costly character, and although it appeared to have been regarded at that time as the most hopeful process for obtaining security and was the subject of numerous essays now known to collectors, it has never been used for postage stamps.

The Treasury Competition, though it may have developed some ideas, produced no definite results in the shape of stamps such as were finally adopted. Messrs. Perkins, Bacon and Petch, the steel plate engravers, had not submitted proposals, and indeed were under the impression that their famous mill and die process would be too costly, owing to their misapprehension as to the requirements. On being informed in December, 1839, that an inch would do for the stamps, they realised the possibilities of their process and set to work to engrave the first Queen's heads. By grouping 240 repetitions of the small Queen's head engraving—it was .9-in. by .75-in.—on the plate they were able to produce our first stamps at a cost of 7¼d. per thousand (exclusive of paper, which was supplied to them) and at a later stage the price dropped to 5d.

The production of the first adhesive postage stamps in 1840 was little short of a miracle, for looking back over 85 years with the knowledge of some 40,000 different postage stamps which have been produced since, collectors point to the 1d. black and 2d. blue of 1840 as unsurpassed in simple dignity of design and excellence of execution. More than that, they have not been improved upon in any essential detail, other than the later invention of perforation.

The intaglio-printed stamp still holds the pride of place for artistic superiority. It gives depth and tone of impression not obtainable in any of the other processes, and wherever the stamp presents a portrait, or view or kindred subject, the best pictorial results are obtained by this method.

Embossing, which was the second process used in producing British postage stamps, has passed out of the range of practical stamp printing to-day, except for certain non-adhesive stamps, e.g., stamped envelopes. Early experts at home and abroad regarded embossing as a strong point in the make-up of a stamp which could not easily be counterfeited. I do not think that embossing to-day would be regarded as offering any additional security, whether in high relief as in the early embossed stamps of Great Britain and Portugal, or in the stamps printed with low relief effect in the printing press, as in Austria, Saxony, Schleswig-Holstein and others. But the passing of this process which gave us the beautiful Wyon "Queen's Heads," the pretty Heligolands and Gambias, is attributable to the modern requirements of perforation. The high relief weakens the resistance of the paper, and this interferes with the operation of the perforation.

Lithography for Stamp Printing.

A few years ago one might have been prepared to say that lithography as a process for adhesive stamps was obsolete, but in the light of recent events the contrary is proved. Historically the process is of the greatest interest to the philatelist, for many of the early issues of remote countries and colonies were produced in a variety of lithographic methods, and it is necessary for us to know something of the possibilities and variations of the process to account for the varieties we find in the stamps. To-day lithography is used in some cases for overprints and surcharges, and since 1918 there has been a revival of the use of lithography for producing stamps in newly independent countries thrown on their own resources and suddenly required to produce their own stamps, e.g., Jugo-Slavia, Fiume, Esthonia, and the Trans-Caucasian Republics. With the solitary exception of Fiume, they have not been good examples of stamp work and have not served to commend lithography as a process suitable for producing stamps except in emergencies and in the less important countries.

Typography is, and is likely to remain for a good many years, the most extensively used method of producing stamps for great and populous countries where the consumption of stamps runs to many millions. The United States, Canada, China, and to a limited extent as yet, Sweden, are the chief exceptions. France began with surface-printed stamps in 1849 and has kept to the method for 76 years; the bulk of our British stamps has been printed typographically since 1880; the stamp output of Germany, Italy, Portugal, Holland, Denmark, Norway, Russia, Finland, Roumania, Czecho-Slovakia, Austria, Hungary and Japan is mainly typographic, as also of our great possessions—India, Australia and South Africa and the Crown Colonies.

I think it may be admitted without argument that the typographical stamp does not give the most artistic results, although some I could name are very beautiful examples of miniature engraving in relief. But Art in the Royal Academic sense is not a prime essential in an article which has to be produced commercially on an extensive scale, and which has to comply with a variety of special conditions. Art in that sense is a useful and desirable accessory.

(To be Continued.)

Lecture delivered at Stationers' Hall on February 4th, before the London Central Master Printers' Association.

Lithographic Trade Review.

CONDITIONS generally in the lithographic section of the industry do not indicate much change compared with a month ago. As far as actual unemployment is concerned amongst lithographic printers, a considerably better position prevails at the present time than was the case this time last year.

ACCORDING to information that reaches us, business at the moment amongst lithographic artists in London is rather quiet, and a considerable number of working artists are reported to be unemployed. It is contended that immediately more enterprise is shown in industry generally, and matters on the Continent become more settled, a reflex action will undoubtedly be felt.

SO FAR as working litho artists are concerned, it is felt that, as in the past, what is needed to help reduce unemployment among its ranks is a vigorous movement in the direction of publicity generally. A return to more normal conditions of trade would be welcome, although unemployment at the present time is nothing like so serious as it was during 1921-22, when a sum of £30,000 was absorbed in meeting the claims of unemployed litho artists and process workers.

ONE of the chief causes of the quietness prevailing in this particular branch of the industry is probably the lack of confidence and enterprise shown by the printer at home to the advances and possibilities of photo-litho. Whilst it is stated this method of printing is being largely developed in America and on the Continent, the British printer—with a few notable exceptions—seems to be unready to change his methods.

FURTHER consideration is now being given to the question of rates of pay on flat-bed offset machines. As we go to press (Wednesday) a conference is taking place between representatives of the Federation of Master Printers and of the Amalgamated Society of Lithographers to consider this matter.

IT will be remembered that this point came before the Conciliation Committee of the J.I.C. on January 21st, when, after the position had been fully explained, the committee came to the following decision: "The Conciliation Committee finds that the rates affecting flat-bed offset machines may not have been considered at the time when the 1919 Agreement was arrived at, mainly because both sides thought that the converted flat bed machine was only a temporary expedient for offset work. In consequence of the foregoing, we are of opinion that a conference should take place at an early date for the purpose of providing a wages' rate for the machine in question on its merits." The present conference is the outcome.

MR. W. P. PRICE'S invention of dry litho by means only of special ink would appear still to be in process of being tried out. We understand that it is being tried at present on a web rotary litho machine, and that some promising results have been obtained.

THERE are interesting developments proceeding with regard to the application of colour photogravure to weekly journalism. The *Illustrated London News* is in the van of this movement, and may be expected to show before long the use of this process under practical commercial conditions.

TENDER.

H.M. STATIONERY OFFICE.

TENDERS to be delivered before 10 a.m., on 24th February, 1925, are invited by the CONTROLLER of H.M. STATIONERY OFFICE for the PURCHASE of SURPLUS PAPER, STATIONERY, OFFICE REQUISITES, TYPEWRITERS, lying at H.M. Stationery Office, Gorse Street, Hollinwood, Oldham.

Forms of tender, with permission to view, may be obtained on applicatian to the Superintendent, H.M. Stationery Office, at 26, York Street, Manchester, or Gorse Street, Hollinwood, Oldham.

Papermaking Shown by Film.

Under the auspices of the Joint Industrial Council for the Printing and Allied Trades, a cinematograph exhibition illustrating papermaking was given in the King's Hall, Bolton, on Wednesday of last week. There was a large attendance representative of both the employers' and operatives' sides of the industry, and visitors were present from Wigan and Leigh, both of which towns are grouped with Bolton in the Joint Industrial Council. Mr. F. Waterhouse, president of the Bolton Master Printers' Association, and representative of the employers on the Council, presided.

Mr. H. M. Stevenson, of Manchester and Birmingham, the managing director of the Universal Paper Agencies, Ltd., explained in a lucid and interesting manner the various processes of papermaking.

Mr. Stevenson was thanked on the motion of the chairman, seconded by Mr. Litterick, local secretary of the National Society of Operative Printers and Assistants.

NORTHERN NEWSPAPER DEAL.—The latest move in the amalgamation of newspaper interests is that Allied Newspapers. Ltd., have purchased the *Newcastle Chronicle*, the *Evening Chronicle*, and associated papets. The present company owning these papers has an authorised capital of £750,000, and the purchase price paid by the Allied Newspapers is stated to be more than double that sum. Sir Arthur Sutherland, Colonel Sir Joseph Reed and Mr. Munro Sutherland are the present directors of the Newcastle paper. The Allied Newspapers Co. was formed about a year ago to take over the Manchester series of papers owned by the *Daily Mail* Trust, and the principal directors are Sir W. E. Berry and Mr. Gomer Berry.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies,
Machinery for Sale and Wanted,
Businesses for Sale and Wanted,
Partnerships and Investments,
Miscellaneous.

One Insertion	**3/0**
Three Insertions	**6/0**

For every line exceeding three lines **6d.**

Situations Wanted.

Under this heading operatives are granted a Special Rate for a minimum of three lines (twenty-one words):—

One Insertion	**1/6**
Three Insertions	**3/0**

For every line exceeding three lines **6d.**

Sales by Auction, Tenders,
Patents for Sale,

Post Office Finance.

ONE effect of the long-continued agitation for a re-introduction of the penny post is that the public generally is taking more interest than ever before in questions of Post Office financial policy. It has been made clear that the reason for delay in lifting the postal burdens that weigh upon industry is the wish, in some quarters, to make the Post Office a profit-earning institution rather than an efficient public service. This point was well stressed by the deputation from the Joint Industrial Council of the Printing and Allied Trades which waited upon the Postmaster-General last week. The main contention of the deputation was the necessity for treating the Post Office accounts as a separate unit of the nation's finance, it being urged that it was not the duty of a Postmaster-General to provide a surplus which might be utilised for the relief of taxation or for expenditure by other departments of the State. The Postmaster-General admitted that there was a good deal to be said for that view of the position, but he was careful to add that other considerations needed to be looked at, and that, for the present at any rate, one must recognise that this was not an accepted principle; so far, any surplus had gone into the general pool. To a representative of this journal Mr. A. E. Goodwin remarked a few days ago that sooner or later this question must be fought out. It is, he said, constantly being stated that the Post Office should not be subsidised at the expense of the taxpayer; but, he asked, is it not also fair to claim that other departments of the State should not be subsidised by the Post Office? One remark of Sir Mitchell Thomson is not likely to escape notice—that the heavy capital expenditure in prospect for the better equipment of the telephone service must be kept in mind. Surely the return of the penny post must not be delayed because money is required for the proposed automatic telephone exchanges! Mr. Goodwin suggests that the public would prefer to wait for these luxuries, if it were a choice between the penny post and automatic telephone exchanges. But is there any necessity for presenting the problem in this way? Capital expenditure for the telephones must be justified on the ground of a more efficient service and subsequent larger revenue from telephones. It will assuredly be considered apart entirely from the advisability of restoring the penny post—and rightly so, for there is no essential connection between the two. Another significant sentence in the Postmaster-General's guarded statement was to the effect that a return to the pre-war standard of postal rates must come step by step. If this means anything it surely means that the penny post is in sight, but that it may not be the old four-ounces-for-a-penny letter rate. Hopes are certainly high that the arguments set forth and the assurances given to the Postmaster-General should assist him to take an optimistic view of the increase in packages which would be posted if lower rates were adopted. He should now be able to put before the Chancellor of the Exchequer an unanswerable case for the return of the penny post in April next.

Machine Compositors' Vigilance ASSOCIATION.

Annual Dinner.

In the absence of Mr. J Gomer Berry, who was unfortunately unable to be present owing to sickness in his family, Mr. George Eaton Hart (of St. Clement's Press) presided over a company which included some 250 members of the Machine Compositors' Vigilance Association with their ladies, in the Princes Room of the Criterion Restaurant, Piccadilly, London, W., on Saturday evening. The occasion was the annual dinner of the Association in aid of the Pension Fund in connection with the Printers' Pension Corporation. The chairman was supported by Messrs. George W. Jones, C.C., T. E. Naylor, J.P., M.P. (secretary, London Society of Compositors), T. W. McAra, J.P. (secretary, Newspaper Proprietors' Association), T. Timberlake (chairman, L.S.C.), Captain Burdon, Messrs. W. M. Bower and H. Wilcockson (Linotype and Machinery Limited), Messrs. H. Blackett and R. C. Elliott (Lanston Monotype Corporation, Ltd.), and Mr. J. W. Lindsay (Intertype Corporation, Ltd.), in addition to Messrs. J. F. D. Dixon (chairman of the Association) and Albert Henwood (secretary). During the dinner music was provided by Mr. W. C. Summers' orchestra.

The toast list was commendably short. Following the loyal toast, "The Printing Industry" was proposed by Mr. T. E. Naylor, and responded to by Mr. George W. Jones; "The M.C.V.A. Pension Fund and the Machine Compositors' Vigilance Association" was given by the chairman, being acknowledged by J. F. D. Dixon; Mr. Philip Evans proposed the health of "The Visitors," to which Mr. T. W. McAra responded.

The speeches, which were excellent in tone and provided a happy combination of the grave and the gay, were interspersed with musical items given by a talented company, under the direction of Miss May Phillips. During the evening donations to the Pension Fund were announced, and, together with the contributions to the "plate" from those present, amounted to £77 16s. 6d. This splendid result made certain the completion of the Machine Compositors' Pension No. 1 (Albert Henwood) in time for the election of the Printers' Pension Corporation in March next.

Specimens of mechanical composition were to be seen on the tables, the various companies marketing type setting machines kindly giving their assistance towards what proved to be a highly successful function. The programme, carried out in Garamond series of roman and italic, was supplied by the Monotype Corporation; the location cards, with information as to the Pension Fund, together with the preliminary circular, were the gift of the Linotype Co.; and the admission tickets for the dinner were provided by the Intertype Corporation—all of which proved beyond doubt the wide range of type sizes and borders, and also the high standard of work, of which the several machines are capable.

Trade Notes.

THE plant and premises of the *Freeman's Journal* and allied publications, which ceased publication at Christmas, have been purchased by the *Irish Independent* Co.

THE action for alleged contempt of Court against the London *Evening News*, arising out of the publication of statements made by Sir Ernest Wild, K.C., the recorder, to the Grand Jury at the Central Criminal Court, on the ground that they were calculated to prejudice the trial of William Cooper Hobbs, was dismissed on Tuesday by a King's Bench Divisional Court consisting of the Lord Chief Justice (Lord Hewart) and Justices Salter and Fraser.

THE new paper which Mr. George Lansbury is to edit will not be called the *Weekly Herald*, but *Lansbury's Weekly*. The first issue will appear on February 28th.

BINDERS' DOCKETS.—Difficulties have arisen in Manchester in regard to time dockets in the binding department. A conference was held in Manchester on Wednesday of last week and was attended by Mr. A. E. Goodwin, Mr. H. Bethell, Mr. Golding, Mr. W. G. White for the employers and by Mr. Harraway, Mr. Kelly and the members of the local branch executive of the Bookbinders' Union. After several hours' discussion it was felt that some misunderstanding had arisen, and certain suggestions were made which were to be reported to the local executive with a view to overcoming the difficulty.

MACHINE RULERS' WAGES.—The Labour Committee of the Federation of Master Printers met representatives of the Machine Rulers' Society on Tuesday of last week to discuss the union's claim for an advance of 12s. 6d. per week for its members. Mr. Hooker stated, for the union, that their membership was confined to London, though they had a few working outside, and he claimed that they should be placed in the same position as other skilled unions in London. Col. Fletcher, for the employers, pointed out that when the last wage reduction was negotiated the cost of living figure was higher than at the present time, and said that wages of machine rulers in London were still 140 per cent. above the pre-war level. Reference was made to work formerly done on ruling machines being done more cheaply by letterpress and litho methods. The deputation was informed definitely that, in the opinion of the employers, it was not in the interests of the industry that there should, at the present juncture, be any increase in the cost. The union representatives stated they would report fully to their membership.

A CONFERENCE has been arranged between representatives of the Master Printers and the Bookbinders' Union to take place on Wednesday next, to consider the special rates payable on certain power bookbinding machines used in London and the provinces.

COLLECTIVE ADVERTISING.—We understand that before the closing date for the reception of names for the first issue of literature by the Collective Advertising Committee of the Federation of Master Printers, there was a large addition to the names. The booklet will be posted in about ten days' time. The preparation of the second item of literature, a leaflet or broadside, is well advanced, and this should be ready for dispatch about the end of March. The third item, which will deal more particularly with lithographic forms of advertising, is also receiving attention and will probably be sent out in April. A copy of the booklet was, we understand, shown to the Postmaster-General, Sir Evelyn Murray and Viscount Wolmer, when the deputation from the J.I.C. waited upon them last week.

NORTH London Master Printers' Association, at its first Exhibition of Work, held at Wortley Hall on Monday, showed that the district is well provided with printers able to undertake all kinds of up-to-date printing. There was a fine show of work, including such lines as litho, photo-litho and offset, with a good selection of posters. Mr. H. B. Naylor earned the thanks of the audience by discussing, in his usual informative manner, many of the items exhibited.

THE death has occurred of Mr. Jonathan Howe, of Gateshead, who was, with his brother, the late Mr. William Howe, founder in 1861, of the well-known firm of Howe Bros., printers, bookbinders, etc., originally in Brandling-street, but now having works in Melbourne-street.

MR. HENRY ARMITAGE, a director of the firm of Messrs. Jowett and Sowry, Ltd., printers and stationers, Leeds, died on Sunday, at his residence at Thorner, near Leeds, in his 66th year.

THE death has occurred of Mr. Joseph Edward Penzer, of Moseley, Birmingham. He had spent all his life with the printing firm of Upton's Ltd., and for 20 years had been a member of the board of directors. He was in charge of the department which produced theatrical and circus posters.

THE death has occurred of Mr. E. W. Cowderoy, of Peckham, S.E., aged 78 years, for 63 years with Messrs. Barclay and Fry, Ltd., printers, London.

Electrotypers and Stereotypers

MANAGERS & OVERSEERS' ASSOCIATION

Members' Informal Dinner.

The third annual informal dinner of the above Association was held on Monday at "Ye Olde London Restaurant," Ludgate-hill, under the chairmanship of Mr. J. Parker. As on the two previous occasions the outstanding feature of the proceedings was the splendid camaraderie that prevailed throughout the evening. To members and guests alike no efforts were spared in making the event as enjoyable and successful as possible. The chairman was again supported—with one or two exceptions—by most of the leading members of the Association. Apologies regretting absence caused by illness were received from Mr. J. Black (vice-president) and Mr. Harry Williams.

The Musical Programme.

Following an excellent repast, a thoroughly diversified musical programme was much enjoyed. The programme, though of an informal nature, the artistes being recruited from amongst the members and their friends, met with much success. Mr. Chas. Hardy (accompanist) and Mr. Geo. Harrison (musical director) as usual filled their respective rôles to the satisfaction of the company. Amongst those contributing to the programme were the following:—The Misses Ethel Maude, S. Parker, Georgina Turner, Nellie Turner, Jessie Wood and Messrs. W. Bishop, F. Kirkland, T. Middleton, J. S. Sunderland, G. Turner and H. Crossland.

The Toasts.

The few toasts offered were couched in felicitous terms, the prevailing note being one of cheerfulness and humour.

Mr. W. C. Warren (general secretary, National Society of Electrotypers and Stereotypers), in proposing the health of the chairman, spoke regretfully of Mr. Parker's recent illness. He felt confident there was no man more widely known and respected in the Association and in their branch of the industry than their chairman that evening.

Mr. Parker, in returning thanks for the way the toast had been received, said he had always tried to live out the teachings of the Golden Rule. Continuing, he remarked that it had always been the endeavour of the Association—though a small one—to make their guests happy at their gatherings. He then in very warm terms welcomed to their festive board the following: Messrs. John J. Garner, Tom Middleton, Jas. Bridger, Geo. Parker, John Parker, D. F. Hynes, C. Hardy, Geo. Harrison, and the representative of the *British and Colonial Printer and Stationer*.

Each visitor appropriately replied.

Mr. W. Longley, in proposing a vote of thanks to the stewards (Messrs. W. M. Forsyth and J. Craske) referred eulogistically to the satisfactory manner in which the arrangements had been carried through.

Messrs. Forsyth and Craske, in returning thanks, made mention of the responsibilities of the secretary (Mr. W. Bullett) in bringing about the success of the evening.

Another memorable evening was then brought to a close by the singing of Auld Lang Syne. The liberal distribution of paper hats—of grotesque shapes, colours and sizes—added to the joviality of the occasion.

Mr. W. C. Warren is to deliver an address entitled "Health Conditions in the Foundry" at the next monthly meeting of the Electrotypers, Stereotypers, Managers and Overseers' Association. The meeting is to take place at 80, Blackfriars-road, at 6.30 p.m., and an invitation has been extended to all those interested to be present.

DIVIDENDS AND REPORTS.

LANSTON MONOTYPE CORPORATION.—After providing for income and corporation taxes, debenture interest, depreciation, etc , the profit for the year ended September 30th, 1924, amounts to £22,045. Including the balance brought in and £7,309, representing an amount written back from deferred profits and part of the dividend and bonus received from an associated company, the total credit balance is £107,704. The sum of £15 632 is written off for unsaleable stock, and the board recommend a balance dividend of 4 per cent., making 6 per cent. for the year, or the same as for the previous year. During the year under review there was a diminution in sales, but this the directors attribute to the unfavourable conditions prevailing in all industries, which inevitably affected the printing trade. The stabilisation of currency in Germany has enabled German printers to place orders, and for the first time since the war monotype machines have been sold in that country.

GEORGE OUTRAM AND CO.—Profit of this Glasgow firm of newspaper proprietors last year amounted to £196,643, to which is added balance from 1923, less corporation tax £27,791, making total of £224,434. There has been placed to London leasehold property reserve £500, to contingency fund £50,000, and to heritable property reserve £30,000, and directors now recommend final dividend of 2s. per share and bonus of similar amount, making 25 per cent. for year. The balance carried forward is £30,755, subject to corporation tax. Previous year dividend of 15 per cent. and bonus of 1s. per share.

NEW COMPANIES.

THAMESIDE PRINTING AND PUBLISHING CO., LTD.—Capital £5,000, in £1 shares; printers and publishers of newspapers, magazines and other periodicals, general printers, stationers, advertising agents, etc. Private company. Directors : W. H. Webber, F. S. Brightmore, and W. W. Seabrook.

RECEIVER APPOINTED OR RELEASED

J. H. WADDINGTON AND CO , LTD. (paper manufacturers, etc., Beighton, near Sheffield). —C. Turner, of 155, Norfolk-street, Sheffield, was appointed receiver on January 26th, 1925, under powers contained in debenture trust deed dated September 10th, 1924.

BANKRUPTCIES, etc.

Re RAMSON AND CO., LTD., printers and stationers, 16, Laurence Pountney-lane, E.C. A winding-up order having been made against this company, the first meetings of the creditors and shareholders were held on February 6th at the Board of Trade Offices, Carey-street, W.C. Accounts were presented showing liabilities £955, against assets £134, and a deficiency of £1,821 with regard to contributories, the issued capital being £1 000. Mr. G. D. Pepys (official receiver) reported that the company was registered in March, 1919, with a nominal capital of £2,000 to carry on the business of printers, stationers, etc. Albert William Ramson was appointed managing director and secretary, and according to the accounts, the company made a net loss every year, with the exception of the year ended March 31st, 1921. The net result of the business was as follows:—1920, net loss, £115 ; 1921, net profit, £7 16s. ; 1922, net loss, £266 ; 1923, net loss, £406 ; and from April 1st, 1923, to date of the winding-up order (October 14th, 1924), the net loss was £477. The failure of the company was attributed to depression in trade which commenced towards the end of 1922 and to insufficient working capital. The creditors left the liquidation in the hands of the official receiver.

Re FOSTER, HUGHES AND CO. — The first meeting of creditors was held on February 3rd, at the London Bankruptcy Court under a receiving order made against Hugh Foster, lately trading as Foster, Hughes and Co., at 29, Castle road, and 32, New Inn, Hall-street, both of Oxford, printer and book manufacturer. The debtor was not in attendance, and Mr. Waterer, official receiver, reported that he had not surrendered to the proceedings. The receiving order was made on January 20th upon the petition of Messrs. Hampson, Bettridge and Co., Ltd., creditors for £115, and proofs of debt amounting to £151 had been lodged against the estate, but he understood that other creditors claiming about £330 were represented at the meeting. The assets were expected to realise about £160. The act of bankruptcy cited in the petition was the departure on or about December 24th of the debtor with intent to defeat or delay his creditors. A creditor said it was a pity that the debtor, instead of leaving Oxford, had not taken the creditors into his confidence seeing that there was a good business which would have realised anything up to £1,000. The case was left with the official receiver to be wound up in the ordinary course of bankruptcy.

Re THEODORE TATTON, 23, Southwark-street, S.E., agent.—The public examination of this debtor was held on February 3rd at the London Bankruptcy Court, before Mr. Registrar Mellor, the accounts showing liabilities of £1,544, against assets valued at £23. Questioned by Mr. V. Armstrong, official receiver, the debtor stated that for about a year he was employed as traveller in the stationery and printing trade, but then, with a capital of £50, he commenced business on his own account at 59 and 60, Chancery-lane, W.C., as an agent for various paper firms. He was not successful ; in 1914 he gave up his agencies and was employed by a Government department until 1916, when he was granted a commission in the Royal Air Force, in which he served until 1920, when he was demobilised. Next he obtained another situation in a Government department, but in May, 1924, he resigned to take up an agency for a printing firm. The debtor attributed his failure and insolvency to having lived beyond his income, and to heavy interest on borrowed moneys. The examination was concluded.

ACCORDING to the returns furnished by trade unions in the printing, bookbinding and paper group of trades, there was a membership at the end of November, 1924, of 99,530. The number unemployed was 3,180, or 3·2 per cent. This represents a decrease of 0·7 compared with the year before.

LORD BURNHAM, at a luncheon of the Livery of the Stationers' Company, at Stationers' Hall on Tuesday, delivered an extremely interesting and informative address on the problems of South Africa. His lordship, it will be remembered, made an extended tour of South Africa last year.

MR. R. A. AUSTEN-LEIGH occupied the chair, and among those present were: Sir William A. Waterlow, Sir Cecil Rodwell, Mr. Edwin Unwin (Past Master of the Company), Mr. F. H. Miles (Senior Warden of Company), Mr. S. Hodgson, Capt. J. E. Fraser, Mr. C. J. Longman, Mr. J. Barcham Green, Mr. F. Murrell, Mr. G. Duckworth, Mr. E. C. Austen-Leigh, Mr. Geo. W. Jones, Mr. J. R. Riddell (hon. secretary), etc.

AN expression of thanks to Lord Burnham for his address was carried on the proposition of Sir William Waterlow.

ALDERMAN SIR J. BADDELEY, Alderman Sir G. Truscott and Alderman Sir V. Bowater, M.P., were amongst those present at the Guildhall on Tuesday when veterans of the City Imperial Volunteers assembled to celebrate the 25th anniversary of the enrolment of the famous regiment of citizen soldiers in the days of the South African War.

SIR ALEXANDER RICHARDSON has resigned the position of editor of *Engineering*, and has accepted an appointment as consulting editor of the *Shipbuilding and Shipping Record*, the *Marine Engineer and Motorship Builder*, and the *Power Engineer*. He continues to be joint editor of *Brassey's Naval and Shipping Annual*, which he took over from the late Lord Brassey's family some years ago.

MR. J. CROWLESMITH, of Messrs. Hazell Watson and Viney, Ltd., is to be the principal speaker at the monthly lunch of the Manchester and Salford Master Printers' Association being held to-day.

MR. W. J. POLLOCK will lecture on "My Trip to South Africa" at a united meeting of the South-West and the West and North-West London Master Printers' Associations at Pritchard's Restaurant, 79, Oxford-street, on Monday, February 16th, the proceedings commencing at 7 p.m.

MR. JOHN SEVER, SEN., of Crumpsall, retired printer, has been nominated to fill the vacancy caused in the Manchester City Council by the elevation of Councillor Robertshaw (Crumpsall) to the bench of Aldermen.

MR W. J. MIZEN, hon. secretary of the North London Master Printers' Association, is leaving England this week-end by R.M.S. "Orbita" for a month's tour in the Mediterranean.

MR. FRANK COLEBROOK, F.A.I., lectured last Friday evening on "Some Points in Machinery Valuations" before the Auctioneers' and Estate Agents' Institute.

MR. LEWIS GILES, of the *Carmarthen Journal*, was, on Friday last, elected chairman of the Carmarthenshire Master Printers' Association for the ensuing year, and local representative to the South Wales M.P. Alliance.

From the London Gazette.

PARTNERSHIPS DISSOLVED.

James Percy and James Buckley, 105, Waterstreet, Manchester, printers, under the style of Percy and Buckley.

THE BANKRUPTCY ACT, 1914.
RECEIVING ORDER.

C. R. H. Smith, carrying on business at 113, Kingsway, and residing at Mendip House, Forest-hill-road, London, advertising agent.

Half a Century of Loyal Service.

Presentation at a Forman Social.

A ceremony of great interest to the printing trade took place at a whist drive and dance organised by the employees of Messrs. T. Forman and Sons, Nottingham, on Friday, January 23rd, 1925, in aid of the General Hospital, when Miss J. Smeeton, who has completed 50 years' service with the firm, was the recipient of presentations from "all ranks." From the firm she received a cheque and clock, the heads of the various departments gave her furs, whilst gifts were also tendered from the girls of the binding department (of which she was for many years forewoman), and the machinemen.

In the absence, through indisposition, of Mr. James Forman, the proceedings were presided over by Mr. D. P. Forman, and the presentations were made by Mrs. James Forman (for the firm), Mr. H. E Barrow (for the chiefs of departments), and Mr. A. Pike (for the machinemen).

In the course of his remarks, Mr. D. P. Forman (speaking for the firm) said that Miss Smeeton was to be congratulated on the ability with which she had carried out her work and also for the good character of the girls for whom she was responsible, but above all he would like to emphasise the importance of the sense of loyalty which she had invariably displayed in all her efforts in the firm's service.

BETTING CASE FOR HIGH COURT.—Holding that the *Reading Sportsman* and the *British Sporting Times* were not *bona fide* newspapers, but were issued at 3d. per copy solely for the purpose of giving purchasers the opportunity, by means of coupons issued therewith, to wager on the result of football matches, the Reading magistrates on Monday convicted the proprietors and publishers under the Football Ready Money Betting Act, 1920. The proprietors were each fined £20 and costs. Fines were also imposed on the printers and circulating agents. The Bench agreed to state a case for the High Court.

DIVIDENDS AND REPORTS.

LANSTON MONOTYPE CORPORATION.—After providing for income and corporation taxes, debenture interest, depreciation, etc , the profit for the year ended September 30th, 1924, amounts to £22,045. Including the balance brought in and £7,309, representing an amount written back from deferred profits and part of the dividend and bonus received from an associated company, the total credit balance is £107,704. The sum of £15 632 is written off for unsaleable stock, and the board recommend a balance dividend of 4 per cent., making 6 per cent. for the year, or the same as for the previous year. During the year under review there was a diminution in sales, but this the directors attribute to the unfavourable conditions prevailing in all industries, which inevitably affected the printing trade. The stabilisation of currency in Germany has enabled German printers to place orders, and for the first time since the war monotype machines have been sold in that country.

GEORGE OUTRAM AND CO.—Profit of this Glasgow firm of newspaper proprietors last year amounted to £196,643, to which is added balance from 1923, less corporation tax £27,791, making total of £224,434. There has been placed to London leasehold property reserve £500, to contingency fund £50,000, and to heritable property reserve £30,000, and directors now recommend final dividend of 2s. per share and bonus of similar amount, making 25 per cent. for year. The balance carried forward is £30,755, subject to corporation tax. Previous year dividend of 15 per cent. and bonus of 1s. per share.

NEW COMPANIES.

THAMESIDE PRINTING AND PUBLISHING CO., LTD.—Capital £5,000, in £1 shares; printers and publishers of newspapers, magazines and other periodicals, general printers, stationers, advertising agents, etc. Private company. Directors: W. H. Webber, F. S. Brightmore, and W. W. Seabrook.

CORBETT, LTD. (bookbinders, etc., London). Debenture dated January 19th, 1925, to secure £500, charged on the company's undertaking and property, present and future, including uncalled capital. Holders : Business Investments, Ltd., 172, Bishopsgate, E.C.2.

RECEIVER APPOINTED OR RELEASED

J. H. WADDINGTON AND CO , LTD. (paper manufacturers, etc., Beighton, near Sheffield). —C. Turner, of 155, Norfolk-street, Sheffield, was appointed receiver on January 26th, 1925, under powers contained in debenture trust deed dated September 10th, 1924.

BANKRUPTCIES, etc.

Re RAMSON AND CO., LTD., printers and stationers, 16, Laurence Pountney-lane, E.C. A winding-up order having been made against this company, the first meetings of the creditors and shareholders were held on February 6th at the Board of Trade Offices, Carey-street, W.C. Accounts were presented showing liabilities £955, against assets £134, and a deficiency of £1,821 with regard to contributories, the issued capital being £1 000. Mr. G. D. Pepys (official receiver) reported that the company was registered in March, 1919, with a nominal capital of £2,000 to carry on the business of printers, stationers, etc. Albert William Ramson was appointed managing director and secretary, and according to the accounts, the company made a net loss every year, with the exception of the year ended March 31st, 1921. The net result of the business was as follows:—1920, net loss, £115 ; 1921, net profit, £7 16s. ; 1922, net loss, £266 ; 1923, net loss, £406 ; and from April 1st, 1923, to date of the winding-up order (October 14th, 1924), the net loss was £477. The failure of the company was attributed to depression in trade which commenced towards the end of 1922 and to insufficient working capital. The creditors left the liquidation in the hands of the official receiver.

Re FOSTER, HUGHES AND CO. — The first meeting of creditors was held on February 3rd, at the London Bankruptcy Court under a receiving order made against Hugh Foster, lately trading as Foster, Hughes and Co., at 29, Castle road, and 32, New Inn, Hall-street, both of Oxford, printer and book manufacturer. The debtor was not in attendance, and Mr. Waterer, official receiver, reported that he had not surrendered to the proceedings. The receiving order was made on January 20th upon the petition of Messrs. Hampson, Bettridge and Co., Ltd., creditors for £115, and proofs of debt amounting to £151 had been lodged against the estate, but he understood that other creditors claiming about £330 were represented at the meeting. The assets were expected to realise about £160. The act of bankruptcy cited in the petition was the departure on or about December 24th of the debtor with intent to defeat or delay his creditors. A creditor said it was a pity that the debtor, instead of leaving Oxford, had not taken the creditors into his confidence seeing that there was a good business which would have realised anything up to £1,000. The case was left with the official receiver to be wound up in the ordinary course of bankruptcy.

Re THEODORE TATTON, 23, Southwark-street, S.E.,agent.—The public examination of this debtor was held on February 3rd at the London Bankruptcy Court, before Mr. Registrar Mellor, the accounts showing liabilities of £1,544, against assets valued at £23. Questioned by Mr. V. Armstrong, official receiver, the debtor stated that for about a year he was employed as traveller in the stationery and printing trade, but then, with a capital of £50, he commenced business on his own account at 59 and 60, Chancery-lane, W.C., as an agent for various paper firms. He was not successful ; in 1914 he gave up his agencies and was employed by a Government department until 1916, when he was granted a commission in the Royal Air Force, in which he served until 1920, when he was demobilised. Next he obtained another situation in a Government department, but in May, 1924, he resigned to take up an agency for a printing firm. The debtor attributed his failure and insolvency to having lived beyond his income, and to heavy interest on borrowed moneys. The examination was concluded.

ACCORDING to the returns furnished by trade unions in the printing, bookbinding and paper group of trades, there was a membership at the end of November, 1924, of 99,530. The number unemployed was 3,180, or 3·2 per cent. This represents a decrease of 0·7 compared with the year before.

Half a Century of Loyal Service.

Presentation at a Forman Social.

A ceremony of great interest to the printing trade took place at a whist drive and dance organised by the employees of Messrs. T. Forman and Sons, Nottingham, on Friday, January 23rd, 1925, in aid of the General Hospital, when Miss J. Smeeton, who has completed 50 years' service with the firm, was the recipient of presentations from "all ranks." From the firm she received a cheque and clock, the heads of the various departments gave her furs, whilst gifts were also tendered from the girls of the binding department (of which she was for many years forewoman), and the machinemen.

In the absence, through indisposition, of Mr. James Forman, the proceedings were presided over by Mr. D. P. Forman, and the presentations were made by Mrs. James Forman (for the firm), Mr. H. E Barrow (for the chiefs of departments), and Mr. A. Pike (for the machinemen).

In the course of his remarks, Mr. D. P. Forman (speaking for the firm) said that Miss Smeeton was to be congratulated on the ability with which she had carried out her work and also for the good character of the girls for whom she was responsible, but above all he would like to emphasise the importance of the sense of loyalty which she had invariably displayed in all her efforts in the firm's service.

BETTING CASE FOR HIGH COURT.—Holding that the *Reading Sportsman* and the *British Sporting Times* were not *bona fide* newspapers, but were issued at 3d. per copy solely for the purpose of giving purchasers the opportunity, by means of coupons issued therewith, to wager on the result of football matches, the Reading magistrates on Monday convicted the proprietors and publishers under the Football Ready Money Betting Act, 1920. The proprietors were each fined £20 and costs. Fines were also imposed on the printers and circulating agents. The Bench agreed to state a case for the High Court.

Printers' Managers & Overseers
(PARENT) ASSOCIATION.

A Canadian Member's Experiences.

At the February meeting of this Association, on Tuesday of last week, the principal feature was a communication from a Toronto member, Mr. G. A. Rumsby, whose paper, entitled "Rambling Reminiscences," was read by the vice-president, Mr. A. H. Wilson. The president, Mr. R. H. Berry, was in the chair.

At the call of the president, Mr. S. A. Dawson reported upon the condition of Mr. J. J. Smith, whom he had visited, the report telling of wonderful cheerfulness in the face of serious illness bravely borne. Reports were also made as to the condition of other members on the sick list, including Messrs. J. Acton and G. H. T. Freeman, in respect of all of whom the Association's wishes for speedy recovery were expressed.

No less than six candidates were elected members of the Association, viz.:—Mr. J. Boyd (*News of the World*, Ltd., Bouverie-street, E.C., printer); Mr. A. Bliss (St Andrew's Press, 44, Hatton-garden, E.C., works manager); Mr. A. J. W. Hitchens (*Bournemouth Graphic*, Ltd., Bournemouth, works manager); Mr. H. C. Ledger (Alabaster, Passmore and Sons, Ltd., Maidstone, overseer composing department); Mr. A. J. Messum (Herbert Reiach, Ltd., Hammersmith, W., works manager); Mr. A. Wood (Huntley, Boorne and Stevens, Reading, overseer Lithographic department). Mr. Messum was present and received a personal welcome.

A welcome was also given to Mr. H. Canham late of the Leicester Centre, who has been transferred to London.

A letter was read from the president of the Liverpool Centre referring to the approaching twenty-first anniversary of the Liverpool Centre, and intimating that an interesting personal feature will be associated with the celebration of that event. The interest of the Parent body was manifested, the meeting giving its approval to a proposition for a substantial grant of money.

After the chairman had called attention to various association activities, and Mr. Simpson had appealed to members for increased support for the monthly whist drives, the vice-president was called upon to read Mr. Rumsby's paper.

This proved to be a chatty communication detailing this member's personal experiences since he quitted these shores some fifteen years ago, when he boldly decided, although already well on in years, to start life afresh in a new country. The writer described the voyage across the Atlantic *en route* for Canada, and then went on to tell of his difficulties in making a start in the land of his adoption. A few good friends were forthcoming, and after some effort he obtained his first job in the town of London (Ont.). Employment here, however, was available only for a very short period, and Mr. Rumsby moved on to Toronto, obtaining a position which he continued to occupy right up to the time of the big 44 hour-week strike in May, 1921. It was the advent of this strike that eventually led to his making his debut as a proprietor printer, when he became for the first time in his life the proud possessor of at least sufficient printing plant to produce small jobbing work. The writer went on to give some particulars of his working life as "a combination of boss, order clerk, superintendent, comp, pressman, cutter, shipper—even proverbial 'devil.'" Mr. Rumsby concluded by touching upon a few differences that exist between the conditions and methods obtaining in Canada and in this country, adding also a few friendly hints to Englishmen who might be thinking of making a fresh start across the Atlantic.

At the conclusion of the paper, the president expressed the Association's indebtedness to Mr. Wilson for his able reading, and referred to the paper as an interesting novelty.

Mr. Baker, who said he was over in the United States in 1899, gave some entertaining and interesting particulars of his own experiences.

Mr. E. W. Whittle said that Mr. Rumsby's letter had appealed to everyone, particularly because of its intimate character, it being like the communication of some one writing home. Mr. Whittle recalled that on the last occasion when an overseas member had contributed a paper for the consideration of the Parent Association, it had been agreed that one of the Association's pendants should be sent to the writer. He proposed that the meeting should give its authority for a pendant to be sent to Mr. Rumsby.

Mr. E. H. Berryman seconded, Mr. Gill supported, and the proposal was carried *nem con.*

A hearty vote of thanks to Mr. Rumsby for his paper, to Mr. Wilson for reading it, and to Mr. Gill for encouraging the writer of the paper, was passed on the proposition of Mr. L. C. Mennell, seconded by Mr. J. C. Pugh, after which Messrs. Wilson and Gill responded.

Printing, Bookbinding & Kindred
TRADES OVERSEERS' ASSOCIATION.

Annual General Meeting.

There was a large muster of the members at the twentieth annual general meeting of the above Association, held on Tuesday of last week at St. Bride Institute, Bride-lane, E.C., under the chairmanship of Mr. J. Fleming (president). According to the annual report, which was presented to the meeting, the executive state that the year just closed can be regarded as one of the most successful in the annals of the Association. Mention is also made of the fact that during the year the Association has been instrumental in securing for their members stabilisation in their relations with the trade unions in the event of a trade dispute. Reference is also made to the serious loss sustained through the removal to Manchester of Mr. G. A. Eden, the Association's honorary technical representative. Three deaths have occurred during the year, whilst fourteen new members have been enrolled. The balance sheet shows a healthy condition of the Association's finances. During the year the benevolent fund absorbed £41, the unemployment fund £58, the funeral fund £60, and the entertainment fund £25.

The minutes of the annual general meeting held in February last year having been read and confirmed, the chairman, in moving the adoption of the annual report, referred to the entertainment fund, which, he said, would have presented a much healthier condition had the members supported in a larger degree the various social events held during the year.

No criticism was offered to either the annual report or the balance sheet, which were both put to the meeting, and formally carried.

The correspondence, next submitted, included letters from Messrs. Chris Atkins, Arnot, Smith and F. W. Bridges.

The letter from Mr. Bridges took the form of an invitation to the Association to pay an official visit to the Printing Exhibition at the Agricultural Hall in May.

The following candidates were then elected to membership: Mr. A. H. Bruce—overseer binding department—Messrs. De La Rue and Co.; Mr. H. Young—overseer banknote, etc., department—Messrs. De La Rue and Co.

The next item on the agenda was the election of a president and a vice-president for the coming year, the chair at this point in the proceedings being temporarily occupied by Mr. F. C. Peacock.

Propositions were then formally moved with the view of filling the respective posts, and as a result Mr. J. Fleming was re-elected president and Mr. A. G. Aves, vice-president, both gentlemen expressing thanks for the honour conferred upon them.

Mr. Fleming moved a hearty vote of thanks for the services rendered by Mr. Ware to the Association during the year, especially on the social side.

The motion was heartily accorded, and Mr. Ware briefly returned thanks.

Mr. Arthur Cox was re-elected general secretary, Mr. A. J. Jones financial secretary, and Mr. A. W. Sandilands treasurer.

Messrs. S. J. Wills and J. Lee were again re-elected trustees, whilst new members of the executive were appointed as follows: Messrs. A. E. Walters, B. J. Sansom, Smith and Cuthbertson. Messrs. G. R. Bembridge and W. T. Lingham do not retire, but remain in office for another twelve months.

Mr. J. A. Esler was unanimously elected the Association's honorary technical representative in succession to Mr. G. A. Eden.

Mr. Fleming and Mr. Cox expressed gratitude to the retiring members of the executive (Messrs. G. Hellery and W. F. Cribb) for the manner in which they had worked for the Association during the past two years.

The remainder of the evening was devoted to a discussion on an amendment to a rule referring to unemployment benefit, which was recommended by the executive. The rule as it stood before amendment entitled every free member of not less than two years' standing to claim unemployment benefit to the extent of 20s. per week for eight weeks, or not more than £12 in any twelve consecutive months. Believing in the financial unsoundness of the unamended rule and the impossibility of the Association's finances being able to stand what was considered to amount practically to a superannuation was the reason why the executive thought it wise to bring forward the amendment.

The amendment was heartily supported by Mr. Bembridge, Mr. J. Walker, Mr. A. E. Walters, Mr. F. C. Peacock, Mr. A. J. Daines and Mr. F. J. Ibbott, who in turn highly commended the executive for its foresight in bringing forward an amendment that would safeguard the Association's funds.

When put to the meeting the amendment was carried, with only two dissentients.

Before closing the meeting the chairman drew attention to the annual dinner arrangements, and appealed for the full support of the members on March 7th at the Holborn Restaurant. Messrs. W. F. Cribb, G. Hellery and A. J. Daines were then appointed stewards for this event.

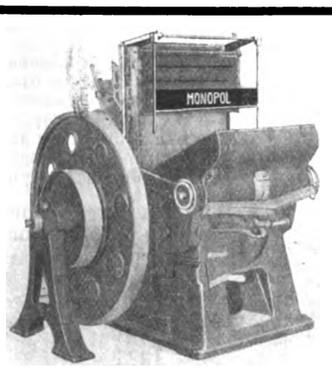
X Of Interest to Envelope Manufacturers.

AT present there is an unprecedented demand for labour-saving machinery. The latest Adjustable High Speed **"Leader" Envelope Folding and Gumming Machine** has been specially designed to operate at a higher speed than any other machine of similar construction. The output is enormous, viz., 185 perfectly folded and gummed envelopes per minute, and the gumming is applied by a wipe-off gummer and not merely dabbed on. This new Machine is almost noiseless even when running at its highest speed. It is built to take any size of commercial or court envelopes within the following range—6½ x 3⅞" down to 4⅛ x 3", and any number of sizes and shapes between these limits can be produced on the same machine.



Be prepared for keen competition by installing High Speed Leaders in your plant.

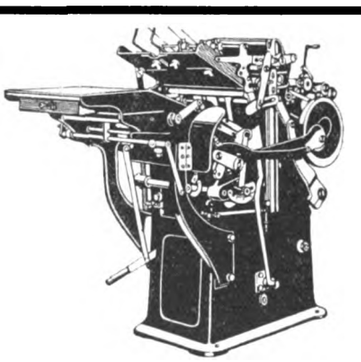
David Carlaw & Sons, Ltd.

31, Finnieston Street, Glasgow.

London Representatives: **DAWSON, PAYNE & LOCKETT, Ltd., Dean Street, Fetter Lane, E.C.4**

BUILT IN 3 SIZES

"Monopol" Art Platen



¶ Specially built to produce the very best Heavy Tint and Register Colour Work at a High Speed.

¶ The Roller Carriage has a special spurwheel drive, which ensures a perfectly smooth and noiseless motion. This important improvement does away with the cam action in the main gearwheel, which is subject to great wear and necessitates frequent costly repairs.

¶ Throw-off of Inking and Distributing Rollers from each other and from the Inking Cylinder by a single lever movement.

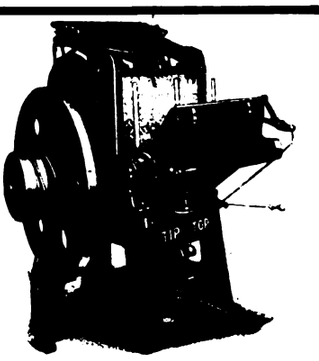
¶ Separate Drive for Inking Rollers, permitting inking-up without running machine, or enabling the platen to be worked for embossing, etc., without the inking rollers moving.

¶ **Automatic Hand Safety Guard** which can also be used as a throw-off. Only a gentle touch of the guard is required to stop the machine.

BUILT IN 3 SIZES.

"Monopol" Safety Platen

will successfully tackle 95 per cent. of your platen work, including the finest Register Colour Work, affording a handsome profit on everything it does.



Speed Range: 2,000 to 3,500 impressions per hour.

The impression is automatically thrown off in case of a misfeed.

The sheets are fed by hand to front gauges on a sloping feed board, in a similar way as on a cylinder machine.

PRINTED SIDE UP DELIVERY, each sheet being in full view of the operator.

The delivery device can be raised out of position in a few seconds to allow for easy access to the platen.

BUILT IN 4 SIZES.

"Tip-Top" Jobbing Platen

Improved inking apparatus of the latest disc type. Platen is cast in one piece and works from positive fixed centre (no cams).

Camless drive of roller carriage.

Base and vertical bed cast in one piece.

Rigid, parallel impression.

Very handy and simple impression regulator.

On the main pinion a steel section is let into the gears at the point most subject to wear during the actual impression.

Throw-off of inking rollers by simple lever action, whilst machine remains in motion.

Adjustable runners.

High speed and light and noiseless running.

Particulars can be obtained from, and a demonstration arranged by the Sole Agents:

36-38, Whitefriars Street,

New Inventions

Washing Litho Printing Surfaces.

In this invention apparatus for washing lithographic printing surfaces, particularly those of rotary lithographic offset presses, comprises one or more rollers or pads having absorbent resilient operative surfaces adapted to be moved into and out of contact with the surface to be washed, the operative surfaces being formed on a number of spaced sections mounted on a common shaft. In one form, Fig. 5, two washing rollers 9, 10, each consisting of a number of sections 1, Fig. 2, having sponge rubber or other absorbent operative portions 3, are driven by gearing from the shaft 15 of the lithographic roller 11 and the roller 10 is reciprocated axially by a rotating grooved cam 17 engaging one end of a lever 18, the opposite end of which engages a groove 21 in the roller 10. A double-armed lever 25, 23, engaging the groove 21 and a similar groove 22 in the roller 9, causes simultaneous movement of the roller 9 but in the opposite

direction to that of the roller 10. The rollers 9, 10 engage constantly with a rotating roller 27 which supplies washing liquid, and are mounted in arms 30, 31, Fig. 7, pivoted about the axis of the roller 27. Links 32, 33 and arms 34, 35 connect the arms 30, 31 to a shaft 36 provided with a hand lever 37 by which the rollers are moved into and out of contact with roller 11. A stop 50 limits the movement of the rollers 9, 10 towards the roller 11. The pressure of the rollers 9, 10 on the roller 11 may be automatically varied by means of a lever 43 actuated by a cam 45 engaging the end of a spring-returned rod 39 connected to an arm 38 on the shaft 36. The rollers 9, 10 are held out of contact with the roller 11 by means of a pin 66 adapted to be passed through a hole in an arm 63 on the shaft 36 into a hole in a boss 65 on the machine frame. Fig. 4 shows a form of washing roller made up of sections 4 having obliquely arranged absorbent members 5 which overlap each other. In the apparatus shown in Fig. 10, a number of absorbent pads 50 are carried in holders 51 secured to a shaft 52 which is reciprocated axially by a double-armed lever 55 engaging at its ends with a grooved cam 57 on the shaft 15 of the lithographic roller 11 and with a pin on the shaft 52. The ends of the shaft 52 are mounted in arms 53 pivoted to arms 69 freely mounted on the shaft 15 and rocked by eccentrics 60 and rods 61 so that the pads receive a circumferential movement in addition to the longitudinal movement. A hand lever 71 on one or both of the arms 53 is provided to move the pads into or out of contact with the roller 11 or to vary the pressure of contact of the pads, and a slotted extension 72 on the arm 53 and a bolt 73 are provided to lock the arm 53 to the arm 69. The invention is patented by Linotype and Machinery Limited, and Mr. J. J. Goulding.

MESSRS. SAMUEL JONES AND CO., LTD., of Bridewell-place, have recently had to take new premises for their export department owing to the rapid growth of this section of their business and have secured the ground floor premises of No. 5, Tudor-street, for this purpose. Postal address and telephone number are the same as heretofore.

New British Patents.

For the benefit of our readers we have arranged for any inquiries relating to Patents, Designs and Trade Marks to be answered, free of all charge, by a Fellow of the Chartered Institute of Patent Agents. Inquiries should be addressed, in the first instance, to the Editor.

Paper Mill Agents.

The British Association of Colonial and Foreign Paper Mill Agents, which was inaugurated in September last, has quickly got to grips with the numerous problems which affect its members. This was clearly indicated at the first business dinner, which was held under the auspices of the Association on Thursday, January 29th, at Anderton's Hotel, Fleet-street, London. Mr. H. B. Legge, the first president of the Association, was in the chair, and a large and representative gathering not only found enjoyment in the opportunities provided for meeting colleagues in the trade, but took a very live interest in the subjects which were brought up for discussion.

Standardisation of Paper in Holland

The committee for standardisation of the dimensions of paper recently published the proposals for the first normal sizes (V. 281, V. 282, V. 283), which correspond with the German Norm Din 476, the Belgian Norm N. 18, the Austrian Norm A. 1,001, the Czecho-Slovakian and Swiss Norm V. S. M. 10,310. Post cards are excluded because subject to international regulations, and tickets made specially. The normal weights of the paper are in grammes per square metre, the measurements hitherto employed being thus eliminated. The weights run from 25 to 400 grammes, increasing by 5 to 80; 10 to 150; 25 to 300, and 50 to 400.

Florence International Book Fair.

British Section being Organised.

The Department of Overseas Trade, in collaboration with the Publishers' Association, is organising a British Section at the Second International Book Fair, to be held at Florence from April 16th to June 16th next. The Fair authorities have allotted Great Britain an excellent exhibiting space in the main Fair building in the shape of a self-contained gallery, with an area of over 2,500 square feet.

The collection of exhibits and allotment of space are in the hands of the Publishers' Association, the Department undertaking the transport and installation work and arranging for the suitable decoration and furnishing of the Section.

As a famous centre of culture and tourist travel, Florence is an ideal site for an exhibition of this character, and the prospects for a successful exhibition are bright. Many nations are expected to participate in the Fair, including France and Germany, and, despite the counter attraction of the larger exhibition in Paris, the international importance of the Book Fair will be considerable.

According to present plans, the British Section will consist of three types of exhibits. Individual publishers will show collections of their publications on separate stands; a combined and classified library of the works shown by individual publishers will form the second feature, and show cases containing exhibits of historic interest and specimens of fine printing and book production will be the third feature.

The British Institute at Florence is co-operating with the Department of Overseas Trade and the Publishers' Association in their endeavours to make the British Section a successful feature of the Fair.

His Majesty the King of Italy will carry out the opening ceremony in person.

Firms or individuals wishing to participate should communicate with the secretary, the Publishers' Association, Stationers' Hall-court, London, E C 4.

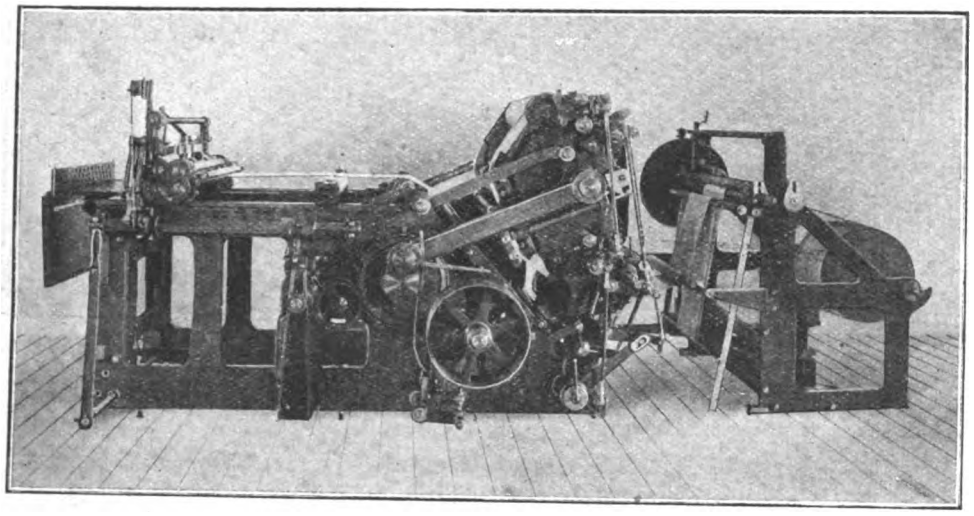
Enterprise

Progress Series.—No. 2.—The Phoenicians, a race of Semitic origin, are recorded in history as the first commercial travellers. They lived by barter—selling and trading their merchandise with the peoples of Europe and Asia as far back as 2700 B.C.

It appears that their commerce with Britain dates from at least the 14th Century B.C.



FOUR thousand years ago, there lived one Baalbazer, a Phoenician trader who plied his wares between Babylonia and Egypt. His markets grew, extending into Asia Minor, Greece, Spain, and even to Britain, because he recognised one very cogent trading factor; giving his buying communities *what* they wanted and sparing no trouble in *supplying* what they wanted. That's enterprise.

In no less degree have the House of Winstone fostered that spirit. Through 76 years of trading they have made better and still better Printing Inks, Rollers, Sundries (Litho and Letterpress), time-cost-and-labour-saving specialities—everything to help the printer achieve better work with less anxiety.

Printers' Costing Problems.

VII.—Keeping in View the Value of Plant.

In view of the increasing necessity for the adoption of up-to-date and scientific methods of printing-house management, an expert in the subject of printers' costing is contributing a series of articles to this journal. The present article is the seventh of this series, and others will follow at intervals. Questions and discussion are invited.

When it is realised that probably 70 per cent. of the capital invested in the printing business is absorbed by plant and machinery, the importance of keeping correct records of the various items making up the total should not be lost to sight.

Probably only a few firms have a complete record of their plant in such a fashion that the history of its various units could be traced.

No Real Costing Possible Without These Records.

The gradual and continuous increase in the price of machinery, which culminated about April, 1920, caused many firms to call in the official valuers to the printing trade, and price inventories were compiled. These were necessary chiefly in connection with fire insurance, but the importance of a complete and detailed history of the plant for costing purposes cannot be over-estimated. To put it plainly, no costing system can be complete unless there is a proper record of every individual item comprised in the plant and machinery.

Buying New Plant.

The question of the purchase of new plant has to be faced from time to time by every firm that wishes to keep abreast of the times, and it is difficult to form any opinion of the necessity for or the value of making changes unless it is possible to learn something of the value of the machines already in use. By value is meant not only the possible price that might be secured by its sale, but also its value as a working unit.

An Historical Card Index.

It is suggested that an excellent method of keeping in touch with the various machines would be to set up a card index—each card to carry the name of the machine, the maker's name, the maker's machine number, the invoice price, the amount paid for carriage (if any), the cost of erection (if any); and in this connection the wages paid to inside labourers should be added to the erection costs. There should be a full specification of the machine, the horse-power necessary to drive it, the date of installation, and, as an addition to the value of the machine, any repairs that have had the effect of increasing the duration of its usefulness. These repairs should be kept separate from the necessary running repairs. Space should be provided for the expected working life of the machine and the amount of depreciation necessary to accumulate funds with a view to replacement at the expiration of the period. Space should also be provided for entering the running repairs necessary from time to time.

These cards should be "tabbed" into various departments of the factory, and in the event of a machine passing from one department to another the card could quite easily be transferred to the particular department in the index.

Identifying the Machines.

It is suggested that machines should be numbered, and by departments. The numbers could either be consecutive throughout the factory, leaving gaps between departments for additions, or could start afresh in each department. These numbers should be painted on the machine and a corresponding number entered on the card index.

Useful Function of the Index.

It would be possible from the card, after the expiration of say ten years, to find out the serviceability of any particular type of machine and to form conclusions very readily as to the desirability of replacing by other machines or of increasing the number of machines of any particular type. From these cards could then be set up a complete plant ledger.

These records would be exceedingly useful for fire insurance purposes.

How to Start the Index.

It is realised that in many firms it would be a lengthy job to trace back the prices paid for these machines on their installation, and if a recent valuation has been made these figures could be used for the purposes referred to. If the inventory is not of recent date, the valuer would review the plant and give a certificate of its present-day values for a moderate fee. It should be pointed out, however, that this is only a substitute for the best method, viz., the the actual price paid for the machine.

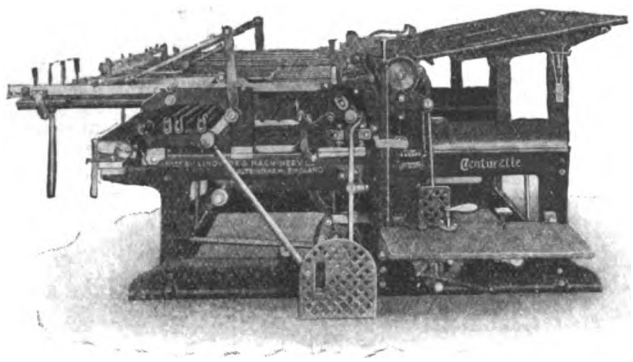
Official Allowances for Depreciation.

Reference has been made to the amount of depreciation necessary to replace a machine at the expiration of the term of its useful life. It will, no doubt, be of interest to give here the allowances for depreciation arranged by the Federation of Master Printers with the Income Tax Authorities. They are:—

Type	... ...	10 per cent.
Machinery	... ...	7½ ,,
Fixtures and fittings	...	5 ,,

all on diminishing value.

In some cases special, fast-running, or delicate machinery has been allowed an increased amount on the figure mentioned above.



Is the Official Allowance Adequate?

Although these are the recognised depreciation allowances for taxing purposes, it must not be taken that any firm is debarred from making its own depreciation figures for balance-sheet purposes. If it is found that any particular type of machine is depreciating more rapidly than the allowance, either by reason of its misuse or through some defect that may have developed, a higher rate of depreciation could be used. It must not be forgotten, however, that this might be written back by the Income Tax Authorities, although for balance-sheet purposes it would be a wise precaution.

A Suggested Basic Figure.

Readers of this article who are members of the Federation of Master Printers may have seen a report that was issued some time ago of a recommendation made by the Costing Committee to the effect that where there is no valuation of plant it was considered that not less than 40 per cent. of the *current* (new) price of any particular type of machine

The Centurette, made by Linotype and Machinery Limited at Altrincham, Cheshire, is size for size the fastest Two-Revolution machine on the market.

It prints Double Demy at 3,000 per hour, and the quality of the work is above that usually obtained from a two-roller machine.

This result is obtained by the excellence of the engineering work put into this press.

Many Centurettes are in use for colour work.

It is made in two styles—(1) with printed-side-up delivery as illustrated above, or (2) with fly delivery.

Fuller details will be forwarded on application to

should be taken as the basis for arriving at the hourly rate. It should be recognised that if a machine is capable of producing work of a satisfactory kind this recommendation is not too high.

The Printing Crafts Guild.

Origin of the English Alphabet.

Mr. J. B. Oldham, B.A., Stockport, interested the members on Saturday the 7th inst. in the Municipal College of Technology, when he lectured on the English alphabet.

It may be taken as an accepted fact, he said, that emblematic signs preceded articulated language and even aided in its formation. In support of such an hypothesis we need only recall the designs which were intended to represent reindeer and other animals, and trees and plants, which were traced by early historians—if they may be so designated—on the horn of the mammoth, and the still more recent discovery of designs of a similar character on teeth which belonged in their pristine condition to some cave bear of the palæological period. In its development writing began with the drawing of material objects, and developed later in the representation of ideas, by means of ideographic signs, afterwards resulting in a sort of alphabet. The Chinese characters and the various sorts of cuneiform characters which border upon the purely alphabetic writing of the Persians furnish an example of this. In the eighth century, the Assyrian mode of writing was adopted by the tribes tributary to that power, and, the adoption becoming general, various modifications were made; but the first of any importance was that of reducing a character by the expression of a single sound—it ceased to be polyphonic and remained syllabic as a result. The Persians, when they borrowed the syllabic signs, attributed the alphabet character to them, such as b for bu or ba. The history of the hieroglyphics of Egypt proves that the alphabets of the East are derived from the Egyptian hieratic and cursive writing. The genealogy of our alphabet goes up again to the Latins and from the Greeks to the Phoenicians, who are of the same race as the Hykos or king-shepherds who conquered and governed Egypt from the fifteenth to the seventeeth dynasty. The strangers took in hand the study and the perfection, at least as confined to practical use, of the hieroglyphics the Egyptians had neglected to make much use of. It is to these wandering Phoenicians that we are supposed to be indebted for our alphabet. Their commercial instincts told them of the immense value of such a system to the Egyptians, but, instead of mastering everything they could in this matter, they only kept those which belonged exclusively to their own affairs. Setting aside the ideographic signs, syllabic and determinatives, their practical sense made them adopt the twenty-two characters from which our alphabet has been taken.

The lecturer said no one knew quite where they stood as to the origin of the alphabet, because the recent discoveries in Crete had so far upset all the well-known theories believed to be correct, that the Phoenicians were the first race of people to hand down the alphabet.

In the discussion which followed, Messrs. Jas. Begg, G. Hurst, F. Hewitt, President John Taylor, F. J. Hughes, and Jas. Worthington took part, the last-named giving an interesting account of the ancient carvings he had seen when travelling in Mesopotamia and the borders of Persia.

WEE MAC.

STATIONERS in this country will view with perhaps mixed feelings the action of the British postal authorities in surcharging to the extent of 2s. 7½d. a packet of notepaper worth about a shilling sent recently from France. It was sent as an exchange gift by a school girl in France to another in England. The parcel, weighing 8½ ozs., bore postage stamps to the value of 1½ francs and on delivery at Wolverhampton had been marked by the postal officials here: "More to pay. Contents—stationery. Of saleable value." Thus the shillingsworth of notepaper cost about 3s.! This category of the Government's fiscal policy is described by the English girl's father "as impudent as dishonest."

THE *British and Colonial Printer and Stationer* circulates all over the world.

Postage Stamp Printing.

By FRED J. MELVILLE.

(Continued from page 102).

In this country we use about 8,000 millions of postage stamps in the year, and the printing of them is an important branch of the printer's business. For a good many years it was almost a monopoly, and, whatever may be said for or against restricting special work of this kind to a particular establishment, it is recognised that Messrs. De la Rue and Co. maintained a uniformly high standard of typographical excellence throughout their contract. Philatelists know also that in the earlier years they devoted a vast amount of technical skill and inventive genius to the production of stamps which would meet all the peculiar requirements of security in tiny scraps of paper.

Since 1910 the business has widened out, and we know that other firms have succeeded in producing surface-printed stamps of high typographical merit and in the vast quantities required. Messrs. Harrison and Sons, after a few months of difficulty, not all of their own making, produced work which was entirely satisfactory and superior to any typographical stamps produced on the Continent. Messrs. Waterlow and Sons, Ltd., have carried on since last January with complete success, and in an incredibly short space of time have obtained an output capacity for coils and booklets beyond the current requirements.

The essential requirements in a postage stamp to-day are the same as in the beginning. In the historic competition of 1839, to which I have already alluded, the Treasury stated the most important points as:—

1. The convenience as regards public use;
2. The security against forgery;
3. The facility of being checked and distinguished at the Post Office, which must of necessity be rapid;
4. The expense of the production and circulation of the stamps.

From the start, the public showed their appreciation of the convenience of the adhesive stamp, as against the stamped envelope. In the first twenty years the demand for stamps impressed on envelopes was only about 1 per cent. of the postage stamps used. Convenience of the public was furthered by the introduction of perforation.

Outwitting the Stamp Forger.

The second requirement was security against forgery. Security can now be comparative only, for with modern facilities anything capable of being printed is capable of approximate, if not exact, imitation. The security our stamps enjoy to-day is due to a combination of complications in manufacture, with the careful control of the distribution and sale of postage stamps in this country.

Typographical stamps in France and elsewhere have not enjoyed the same immunity from forgery as our stamps, mainly because it has been possible under the French and other systems for counterfeiters to unload their forgeries on a large and profitable scale.

Along with security from forgery, we may now couple protection from the more insidious, if paltry, fraud of cleaning old stamps for re-use. This sort of fraud appeared soon after the first stamps were issued and caused a considerable flutter at St. Martin's and the Stamp Office. It has been a sort of bugbear to the officials ever since, and the subsequent unification of postage and revenue duties made greater precautions necessary.

I shall try and show, as briefly as possible, the combination of technical factors in making our stamps difficult to counterfeit and to use more than once.

The paper is an important factor. It is supplied to the printer by the Government, and is of a cotton rag basis, the linen rag papers used for bond papers being too hard for stamp printing. A uniformly good quality of paper is important in maintaining the maximum of security, and economy in the quality of paper is to be deprecated. The watermark is no longer regarded as the protection against forgery which it was considered to be in earlier times. It is, however, a factor in the control of the manufacture of stamps, the watermarked paper having to be accounted for throughout, and no similar unwatermarked paper being permitted in the printing room. Once on a letter, the watermark in a stamp is not seen, but in the event of suspicion of forgery the absence of the watermark would be an important, if not absolutely conclusive test.

The register watermark has now been abandoned for the all-over or continuous chain watermark, a factor in the economy of paper costs, and a saving of labour at the printers'.

The gum now used is pure arabic, and the specification requires one gram to be used on an area of 76 square inches, or at least 20 per cent. of the total weight of the stamps. The public do not experience any difficulty nowadays with the gum, but both printers and public found it a troublesome matter in the early days. What would we say to-day, if such instructions were necessary as those which appeared in the Glasgow Post Office Directory for 1848? "The most effectual plan is to dip the stamp wholly in water, to shake off the water immediately, and to press the stamp upon the letter with a piece of clean blotting paper. When the gum is dull in appearance, it will require rather more time and moisture to make it stick firmly than when it is glossy. The purpose of wetting the stamp wholly is to counteract the tendency it has to curl up from the letter when one side only is wetted—a tendency caused by the expansion of that side as it imbibes the moisture."

The best typographical results are obtained by printing on paper after it has been gummed. This has presented difficulties in the past owing to the sheets curling at the press. In Russia, from early times, this difficulty was obviated by surfacing the paper, giving it a coating of a chalky nature to counteract the gum coating on the reverse. When chalk surfacing was adopted in England, it was for a different purpose, namely, to make it impossible to remove cancelling marks without destroying the stamp image. Curling is obviated here by the now familiar method of Messrs. Samuel Jones' non-curling paper. The plate-glazing, which gives the paper its polish has also the effect of keeping the sheets from curling at the press

The designs of our present stamps vary, but are all consistent in presenting fine line effects with but little solid colour. I think the 1d. stamp is the best, and hope it will soon regain its pre-eminence with the restoration of penny postage. The lined effects do not make the printer's job easier; the ordinary printer would, no doubt prefer more solids, but this is an additional factor towards security. The French stamps recently forged on an extensive scale had the solid background familiar on the Sower type of France.

A portrait may be a contributory factor in obtaining security, and, in illustration of that, I show at your exhibition to-day an autograph letter from Rowland Hill, in which he says: "I am not sure if you are aware why the human countenance was taken for the stamp—it was for this reason, viz., that the eye is accustomed to distinguish minute differences between one human form and another. Now the multiplication of faces in the genuine stamp is by a mechanical process, from a single original die, and all are strictly identical. . . ."

Rowland Hill was referring, of course, to the old Queen's Head, but his remarks are equally, if not more, applicable to the King's Head. In any spurious copy, a thickening of the shading lines on the face, or the loss of a line, alters the expression, and it is a common trait that variations in expression in a familiar face arouse attention.

As philatelists have good reason to know, with these lined backgrounds no two printing establishments will produce exactly the same results; our stamp catalogues distinguish between the De la Rue, Somerset House and Harrison printings of the King Edward stamp plates, and these are severally identifiable partly by colour, but also by the impression, the differences being due in the main to different overlaying.

The inks used for our stamps are required to be quick drying, and fast on exposure for six hours to the light of a mercury-vapour lamp. They must be free from lead or any poisonous substance, and must be insoluble in water, yet of such a character as to be absolutely secure against the successful removal of cancelling ink without material alteration of the colour. This problem of preventing the re-use of stamps is still agitating the authorities, and experiments have lately been made with chemically-prepared paper which would make even the removal of writing ink impossible.

The Patent Rolls here and abroad bear evidence of the extent of this paltry fraud of cleaning stamps for re-use. A variety of curious methods have been tried, and specimens of many of them exist as interesting items in collections. But some of the suggestions are freakish in the extreme. One inventor would have the stamp cancelled by punching holes right through the stamp and letter, while another proposed that embedded in every postage stamp there should be a percussion cap which would explode on being struck with the postmarking chop.

The Process of Perforation.

Perforation of stamps is a fascinating subject, on which we might dwell in a lecture by itself. It is not only a convenience to the post-office and the public, it is a great factor in security. To the ordinary man the perforation of paper does not at first glance appear to present any great difficulty. But good stamp perforating is obtained only by the proper use of elaborate and ingenious machinery. Curiously enough, there appears to have been little or no perforating of paper prior to its introduction for postage stamps. This invention for increasing the convenience of stamps was the idea of an Irishman, Henry Archer. He was not a mechanic; he had been managing director of a Welsh railway, but at the time of the perforating experiments, was down on his luck, a free-lance journalist in London. There are several supposed stories of how the idea came to him. The one I give is on the authority of an old colleague of my father's, George Moir Bussey, still well-remembered in Fleet Street.

Archer was in the bar-parlour of the "Red Lion," Fleet Street, one night in 1847. At a table opposite him was one Charles Fowler, a well-known penny-a-liner, whose speciality of reporting fires in the Metropolitan area had gained him the nickname of "Fire Fowler." Fowler had been writing letters, and having got them ready for affixing the postage stamps, found himself without knife or scissors to cut the stamps apart. Taking a pin from his coat, and laying the block of stamps on the table, he pricked through the paper at close intervals, and soon was able to tear the stamps apart.

Archer, who was watching the process, soon afterwards (October, 1847) submitted his first proposals to the Postmaster-General. His first idea was to prick the paper with rollers, but this was not successful, and then he hit upon the principle of the comb perforator, punching out holes by means of short flat-ended steel wires or punches, fixed vertically over a matrix steel plate and working through a guide plate. In principle that is the same as we have in use to-day, but Archer,

MODERN

Electrotyping and Stereotyping.

Mr. J. S. Sunderland at Cambridge School of Art and Technology.

The interest which Cambridge takes in the craft of printing was again demonstrated when Mr. J. S. Sunderland (instructor in electrotyping and stereotyping at the London School of Printing), spoke recently on the subject of modern improvements in electrotyping and stereotying machinery. The meeting was presided over by Mr. Walter Lewis, University Printer, of the Cambridge University Press.

Mr. Sunderland, being called upon for his lecture, proceeded to say that fifty years ago the only systems that were in use were the oldest system of stereo plaster printing plate, the wax moulding system of electrotyping, and the almost new papier maché system of stereotyping which had not come into general use. In those days on the title and imprint of books was the information that the book was printed from stereo plates—showing that it was a novelty to print from plates. In the making of plates there was little power used; saws, lathes and planing machines all were driven by hand or foot man-power. This state of the business could not go on, and the large growth of printing a few years after the 1870 Education Act made printing machinery and faster methods a necessity. This growth is indicated by the fact that there were in London about 200 electrotypers and stereotypers in 1870, whilst to-day the number is nearer 2,000.

Mr. Sunderland went on to explain the making of the stereo plaster plate and then spoke of the growing demand for quicker methods which came along in the form of the papier maché process, a process which was responsible for the ease with which they were able to obtain news of events a few minutes after their occurrence.

Stereo Flongs.

There are various methods, he said, of producing what are termed faced stereo flongs. Every stereotyper has a so-called secret composition that he uses. This faced flong is made by the use of a composition which fills in the pores of the paper and gives a beautifully smooth printing surface to the stereo plate. These stereo flongs consist of a series of papers pasted together with a fireproof composition consisting of paste made of flour, china clay, size, glue or gum and beaten into the forme or illustration with a close brush which produces a mould or matrix of the original, the mould being dried under steam, fire or electrical heat.

There are a number of stereo flongs which are termed "dry" flongs and are largely used for newspaper work. In this method of stereotyping the results are exceedingly quick. In six minutes plates are obtained ready for machines running at over 32,000 per hour, the copies coming from the machines off the reel printed, cut, folded and counted in quires ready for bundling at the rate of 600 per minute.

The methods adopted to obtain good results in illustrations are interesting. One method adopted is the cutting of a suitable paper underlay that will give relief to the stereo newspaper plates. The machine minder usually cuts the underlay, and the zinco blocks are sent to the foundry to be pressed.

The second method is a photo-mechanical one, a second print being put on metal and the high lights etched away with some of the middle tones. These methods are adopted by most of the London newspapers. This lowering of high lights and the middle tones bears an analogy to the systems adopted by the old-time wood engravers of lowering the high lights by engraving them to a lower plane than the remaining part of the wood cut, thus helping the printing by protecting light parts of the illustration from taking too much ink from the rollers.

Recent Scientific Progress.

The speaker thought he would not be doing justice to his subject if he did not mention the great improvements that have taken place during the last ten to fifteen years in producing colour stereotyping plates, the use of facing compositions on the ordinary wet flong, and the use of some of the many ready-made commercial flongs that have been brought into use.

From the electrotyping side of plate making, he said, there have also been wonderful scientific improvements. Electrotyping from about 1840 was only a scientific novelty. The invention of the Smee battery by Dr. Smee and the discovery of graphite or blacklead as a conducting medium of electricity gave to the world the wax electrotying process that is in general use to-day. Electrotype copper shells, before the introduction of dynamos, took usually twelve hours for an ordinary shell, whilst to-day, with the dynamos, the same thickness of shell can be produced in fifteen to twenty minutes, if necessary. With regard to lead moulding, he considered it a beautiful process, but it required rather heavy and powerful presses. The use of depositing nickel in electros as well as stereos had been of outstanding interest the last twenty years, especially in the case of depositing nickel on wax moulds.

In concluding, the lecturer said that although stereotying of plates by many different methods was prevalent in England, there was still a necessity for the high grade electrotype. American printers still insisted upon the electrotype plate for most purposes. In this country, whilst adopting all up-to-date scientific methods that research may bring to light, the commercial aspect was always present, and possibly the differences in systems of the two countries generally make for all concerned considerable food for observation and thought in the printing business.

At the conclusion a number of technical questions were put to the lecturer, who answered in an able, and sometimes humorous manner, queries relating to hardness of nickel, use of osokerite for moulds, cupping of letters, mounts for plates, etc.

A close inspection of a number of exhibits of work brought an interesting evening to a close.

THE death has occurred from heart failure, after only two days' illness, of Mr. H. W. Matthews, who for nearly 40 years had been with Messrs. W. H. and L. Collingridge, 148-9, Aldersgate-street, on the advertising side. In his early days he was associated with the *Rock*, and later he was identified with the *City Press* and *Amateur Gardening*.

A Final Warning to Buyers of British Goods

On February 16th the British Industries Fair, larger, wider in scope and better than ever, opened its doors to buyers of British goods. If *you* as a buyer or potential buyer fail to visit this great exhibition of British Manufactures—the leading firms in every sphere of production are to be there—you will be definitely playing into the hands of your competitors who will assuredly be there. Then make definite arrangements—*now*—to visit

The British Industries Fair
Birmingham, Feb. 16 to 27, 1925

The Schedule of Exhibits Includes:—

PAPER, STATIONERY AND STATIONERS' SUNDRIES AND OFFICE APPLIANCES, PRINTING, BOOKS, FANCY GOODS, LEATHER GOODS, TOYS AND GAMES, SPORTS GOODS, etc.

The General Manager,

The British Industries Fair,
95, NEW STREET——— ——BIRMINGHAM.

Trade Notes.

TENDERS are invited for the supply of quantities of printing papers, boards, printing ink and bookbinders' materials required by the Government Printer, Pretoria. Sealed tenders, superscribed "Tender for the Supply of Stores to the Government Printer, Pretoria," must be addressed to the chairman of the Union Tender Board, Union Buildings, Pretoria, and must be in his hands by 3 p.m. on Wednesday, March 18th, 1925. Particulars and samples may be seen by interested firms on application to the Department of Overseas Trade (Room 41 for paper and boards, Room 45 for bookbinders' materials), 35, Old Queen-street, London, S.W.1.

IN connection with the dispute in Manchester over the question of binders' time dockets, it has been arranged that Mr. A. E. Goodwin is to address a mass meeting on the subject at Manchester on the 27th inst.

IN the course of an action in the King's Bench Division on Monday, between the General Accident Assurance Corporation and a firm of underwriters, it was stated that the London *Daily Express* paid to the former £24,130 per annum as premium, in consideration of the insurance company taking the liability of the newspaper's insurance scheme.

REPLYING to Sir H. Brittain, in the House of Commons, the Postmaster-General stated that he was unable to make any further statement in regard to the possibility of introducing this year Imperial penny postage.

THE latest town to be visited by the exhibition of printing arranged by the Design and Industries Association is Bradford, where a good and varied showing of printing has been arranged in the Bradford School of Arts and Crafts.

THE employees of Messrs. E. J. Arnold and Son, Ltd., printers, Leeds, were on Saturday evening entertained by the proprietors to a social evening at the Salem Institute, Leeds. During the proceedings Mr. W. H. Webster, on behalf of the workpeople, thanked the firm for their generosity. Mr. E. G. Arnold, the principal of the firm and ex-president of the Master Printers' Federation, and Mr. H. Wood, a director, responded, and gave interesting information on the business side of the concern.

ENFIELD FIRM'S DINNER.—A company numbering seventy assembled at the George Hotel, Enfield, on Friday evening last week, the occasion of the third annual dinner of the firm of Meyers, Brooks and Co., Ltd., printers and publishers of the *Enfield Gazette*. The company consisted of the staff and their friends, and presiding over the gathering was Mr. A. R. Wiseman, the genial managing director. Supporting him at the chairman's table were Mrs. A. R. Wiseman, Mr. and Mrs. Bateman, Mr. Amos Perry, Mr. C. W Maunder (editor) and Mrs. C. W. Maunder. Colonel H. F. Bowles, J.P., though unable to attend the dinner, spent an hour with the company later in the evening. An excellent dinner, happy speeches, dancing and concert made up a very enjoyable evening.

NEWTON ABBOTT DINNER.—Mr. E. Baker presided at the annual dinner of the Newton Abbot printers, to which invitations had been extended to the master printers and the local journalists. Comment was made upon the fact that the chairman and Messrs. W. Rice and A. Haynes had between them an average period of services extending to 48 years. A vote of sympathy was passed with Mr. A. Mortimer in his illness.

THE comnanionship of the *Daily News* and *Star* gave their annual concert on behalf of the Caxton Convalescent Home, at the London and Brighton Hotel, Peckham, on Saturday evening. Mr. Harry Murch occupied the chair, and was well supported by the chapel officers. Mr. Will White (musical director) arranged for a talented array of artistes, who did their best to entertain the crowded audience. A very gratifying "plate" of £36 was announced at the close of the evening.

WAR ORPHANS' FUND.—The Scottish Branch of the J.I.C. made their collection in Scotland during the Christmas week, and as the result of their efforts £777 was collected and has been forwarded to the Printers' Pension Corporation. This sum is considerably in excess of the grants made to the Scottish War Orphans, and now brings the total figure raised by the Joint Industrial Council above the previous year's record.

THE District Committee of the Joint Industrial Council in Manchester is making good progress, and a whist drive and social are taking place on Saturday the 21st inst., when it is expected that there will be an attendance of 500.

EXHIBITION OF FINE PRINTING.—Arrangements for the Exhibition of Fine Printing to be held in the City of Liverpool Art Gallery in March next are well forward. Organised by the City Education Committee, the Exhibition will display the best work in modern printing, posters and other colour advertisements, finely printed and beautifully bound books, the latest developments of wood engraving and other forms of book illustration. Exhibits which have already been received from the leading printers and publishers of Great Britain and abroad indicate that the Exhibition will appeal specially to the printing trade, whilst containing much of interest to the general public.

IN the Mayor's and City of London Court recently the Dolphin Studios, 443, Strand, sued the Low Temperature Carbonisation, Ltd., 14 and 16, Cockspur-street, for £40 for work done designing artistic posters. Miss Doris A. O'Neil, a partner in the plaintiff firm, deposed that the sum sued for was fair and reasonable. The defence was that the sum claimed was excessive. The Common Serjeant fixed the price at £25. Judgment was entered for plaintiffs, with costs.

MR. THOMAS NICHOLS (78), of Thomas Nichols and Son, printers, Kensington, while visiting the works of Messrs. Phillip, Son and Nephew, on Monday, collapsed, and was found to be dead on arrival at hospital.

MR. ROBERT NEASHAM, who died on Friday last, at the age of 75, was for nearly fifty-six on the composing-room staff of the *Yorkshire Post*. On the completion of fifty years' service Mr. Neasham, who retired in December, 1923, was presented by the proprietors with a silver goblet.

MR. SAMSON CLARK, chairman of the London firm of advertising agents, has died at Mombasa of heart trouble. Mr. Clark had gone on a short trip to Kenya Colony, and was expected home at the end of this month.

MR. JOHN BUNE, who had been for over forty years a member of the staff of *The Times*, and for the last eleven years chief of its Parliamentary reporting staff, has died at Beckenham, aged 69.

MR. ARNOLD WHITE, who has died at Farnham Common, Bucks, was a well-known journalist on social and naval topics, and as "Vanoc," was a widely-read contributor to the *Referee*.

MR. MEICHEL HARRY DE YOUNG, proprietor of the *San Francisco Chronicle*, died in that city on Sunday, after a surgical operation.

MR. GEORGE BOYDEN (88), of Stratford-on-Avon, owner and editor of the *Stratford-on-Avon Herald* left £7,915 (net personalty, £6,056).

THE late Mr. Richard James Mecredy, of Bray, Co. Wicklow, founder, editor and principal proprietor of the *Irish Cyclist* and *Motor News*, left £12,128 (estate in England, £10,263).

BY the will of Miss Rhoda Lewisa Josephine Lambert, Clifton, Bristol, a "Breeches" Bible has been bequeathed to the Chapter of Bristol.

THE late Mr. Thomas Minstrell (74), of Pembury, near Tunbridge Wells, journalist, formerly in Press Gallery of House of Commons, left £22,828.

THE late Mr. George William Osborn, J.P., D.L., of Uplands, Heath Common, Sussex, a director of the Wall-Paper Manufacturers, Ltd., who died on November 10th, in his 81st year, left property of the value of £238,968, with net personalty £221,453.

THE late Mr. Robert Thomas Palmer, of Leicester, and of Brixton, London, S W., paper box manufacturer, left £15,148 (net personalty £2,246).

THE late Mr. John Jeremiah Banks (81), of Prestbury-road, near Cheltenham, formerly carrying on business as John J. Banks and Son, booksellers and stationers, 17, Promenade Villas, Cheltenham, left £35,005.

THOSE having Printers' Pension votes to dispose of and who may not happen to know where to place them are asked to remember the claims of Mrs. Caroline Dyke, whose recommending subscriber is Mr. Edgar L. Waterlow. Mr. J. E. Dixon (Amalgamated Press, Lavington-street), will be pleased to receive help in the direction indicated.

Master Printers' Social Gathering.

Mr. W. J. Pollock Lectures on His South African Trip.

A very successful and enjoyable evening was spent on Monday when a united meeting of the Associations of Master Printers of West and North-West London and South-West London took place at Pritchard's Restaurant, Oxford-street. The company, which numbered close upon 70 ladies and gentlemen, not only took full advantage of the opportunities afforded of engaging in social intercourse, but in addition had the pleasure of listening to an excellent lecture by Mr. W. J. Pollock on his recent trip to South Africa. During an interval in the lecture, songs were rendered by Miss May Price and Mr. Harry Bangert (with banjo accompaniment), assisted by Miss Rose Price (pianist). A number of appropriate and very fine views were thrown on to the screen while the singing was in progress.

Among those present were Mr. Alfred Langley (president of the L.M.P.A.), Mr. R. F. Hunger, Mr. W. J. Boyle, Mr. R. B. Simnett, Mr. E. G. Cole, Mr. John R. Burt, Mr. J. Emlyn Jones, Mr. P. G. Crannis, Mr. W. Whyte (secretary, L.M P.A.), and Mr. J. Johnson (organiser, L.M.P.A).

Except for the election to membership of five new firms (three from the South-West and two from the North-West) no other ordinary Association business was transacted.

Mr. Hunger, in calling upon Mr. Pollock to address the meeting, welcomed the many representatives present from other district Associations.

Mr. Pollock then proceeded - with the aid of some ninety excellent lantern slides, many of which were from his own photographs—to give an account of many of the most interesting episodes of his travels. Places visited included Cape Town, Port Elizabeth, East London, Durban, Ladysmith, Johannesburg, Mafeking, Bechuanaland, Bulawayo, and the Victoria Falls. With regard to the last-mentioned place some very fine views were thrown on to the screen, many of the photographs of the Falls being secured at considerable risk and trouble. Mr. Pollock said he received a very warm welcome from printers in many of the towns. From the conversation he had with them he judged that they too had their difficulties in the way of bad trade, unfair competition, etc. Amongst the more exciting experiences encountered by Mr. Pollock whilst on his travels were the presence —unknown to himself—of a number of leopards, and at another time of a herd of baboons.

On the proposition of Mr. Simnet, seconded by Mr. Boyle, a very hearty vote of thanks was accorded Mr. Pollock for his interesting and instructive lecture.

Mr. Hunger tendered the best thanks of the company to the musical artistes and the lantern operator, Mr. H. Reeves Hall, for their able contributions to the evening's enjoyment.

An adjournment was then made to an adjoining room, and after the inner man had been amply refreshed the company settled down for a brief period to further music.

The function proved in every way an unqualified success.

THE *Daily News* and *Star* composing companionships held a most successful concert in aid of the Printers' Pensions Corporation at the Masonic Hall, Nightingale Hotel, Wood Green, on Feb. 7th, under the chairmanship of Mr. H. Murch. The "plate" amounted to £34.

Under the presidency of Mr. Lionel Savory, some of the London papermakers' agents and representatives entertained to lunch Messrs. Herring, Kennett, Herring, junr., and Cripps in the Committee Room at the Constitutional Club on Tuesday, the 20th ult. The lunch was to celebrate the taking up by Mr. Kennett of a partnership in the old-established firm of Herring, Dewick and Cripps.

British Industries Fair.

Opening of the 1925 Exhibition in Birmingham.

The fact that the British Empire Exhibition is to be re-opened at Wembley this year is responsible for the incorporation of the London section of the British Industries Fair with that of the Birmingham section. Every effort has been made to make the joint Fair a great success. The Birmingham Corporation actively co-operated in the undertaking and the local Chamber of Commerce lent its aid in getting the exhibits together.

The Fair, which opened on Monday, is essentially a business organisation, its primary object being to promote trade at home and abroad, and the time has been selected as convenient for overseas buyers who can visit this country on their way to the Fair at Leipzig. The predominant note of the exhibits is utilitarianism. There is much artistic work of a high order, but it is art applied to commercial ends.

Comprehensive Exhibits.

Visitors will the more easily visualise the comprehensiveness of the exhibits by the fact that they are all brought under one roof, covering something like 170,000 square feet of space. In the Midland section particular attention is naturally devoted to hardware, which constitutes a remarkably fine exhibit, every conceivable trade being represented on the stands. The range of brassfoundry, hollowware, metals, ferrous, non-ferrous and alloys, and engineering covers a vast field, and in the engineering section engines, gas and oil, are installed, and these, like much of the machinery, are to be seen in motion.

Birmingham Corporation displays a large group of exhibits, prominent among which are a couple of steel houses, the first to be erected in this country, and the construction of which occupied twelve working days.

In the groups which belong to the London section, representing the lighter industries, jewellery and cutlery form an attractive and important group. Silver and electro plate manufacturers are also well represented, and another noteworthy feature in connection with the leather trades is the artistic painting of leather goods.

Printing and Stationery.

On the printing and stationery side a number of stands were taken by local firms, but a number of large London houses, which are usually associated with the Fair, were conspicuous by their absence.

Warrillows, Ltd., of Birmingham, Manchester and London, who operate one of the largest and most modern printing plants in the country, give a display of high-class catalogue and general printing. Other directions in which they specialise is the manufacture of cartons and all kinds of folding and rigid cardboard boxes for a variety of trades and purposes. Other specialities include loose leaf books, relief stamped stationery and so on.

Messrs. Soloman and Whitehead, Ltd., is another local printing firm to be found at Stand No. 26, Building AA, Block 1. They have developed colour printing to a fine art and are particularly well known for their catalogues, show cards, labels, commercial calendars and facsimile oil paintings. Stationery in a variety of forms also emanates from this house, among whose products may be mentioned fancy boxed stationery, compendiums, engagement tablets and many other similar lines.

Playing cards and stationery goods are shown by the British Playing Cards, Ltd., Birmingham and London, on Stand 38, Block J. Ingenious uses for playing cards have been found by this firm particularly in the direction of advertising, and their display is an education in this respect.

Modern commercial stationery is a feature of the display by Manifoldia, Ltd., who, in addition to office and factory equipment embrace a variety of stationery goods, such as carbon papers, cheque books for shops and stores, calendars, envelopes, counter rolls, and stationery sundries.

Several publishing firms are also to be found in the Fair, among whom may be mentioned the Albion Publishing Co., Ltd., Liverpool, the *Birmingham Post* and the *Birmingham Mail*, Lindley Jones and Bro., London, Birmingham and Manchester.

A Successful Start.

On the occasion of a luncheon held at the Fair, Mr. J. Percy. Plant, chairman of the Management Committee, stated that the Fair was a genuine effort to get industry moving and to solve the question of unemployment. The position at Castle Bromwich, being in the centre of the country, was an ideal one, and another advantage was that many of the exhibitors had made arrangements to take buyers by motor car to see their products in the actual process of manufacture. Mr. Plant added that the Fair, even at this early stage, was a great success. He confidently thought that practices and suggestions put forward by the Fair would act as a great push forward and enhance the country's faith that at last we have got a general move in trade.

New British Patents.

For the benefit of our readers we have arranged for any inquiries relating to Patents, Designs and Trade Marks to be answered, free of all charge, by a Fellow of the Chartered Institute of Patent Agents. Inquiries should be addressed, in the first instance, to the Editor.

Applications.

Astley, T. Binder for loose sheets. 2,980.
Bassist, E. Photographic half-tone plate. 3,406.
Bridges, F., Codling, W. R., Firman, H., Hoskins, B. D. W., and Tisdale, H. W. Book edge printing machine. 3,270.
Eva, A. Cartons, etc., for loose material. 3,249.
Feldman, E. D. Fastening together sheets of paper. 3,031.
Frohn, L. J. Sheet feeders. 3,302.
Hobson, C. W. Folders or binders for paper patterns, etc. 3,001.
Rose Bros. (Gainsborough), Ltd. Wrapping machines, etc. 3,340, 3,341.
Smith, W. H. Printing and embossing sheets. 3,234.

Specifications Published.

1923.

Barker and Dobson, Ltd., and Town, W. R. Cardboard and the like display boxes. 228,290.
Billo, O. Machines for printing on textile fabrics, paper, and the like. 207,550.

1924.

Braren, L. K. Pantograph mechanisms for engraving machines. 228,418.
Dausmann, C. F. Printing presses. 228,320.
Deutsche Renck Rapid Klischee Anstalten Ges. Production of printing plates by the bi-chromate printing process. 217,246.
Hart, H. (Mergenthaler Linotype Co.). Typographical composing and distributing machines. 228,471.
Horner, J. H. Machines for printing words and figures on cheque, dividend warrants, and the like. 228,375.
Lamson Paragon Supply Co., Ltd. (Paragon Kassenblock Akt. Ges.). Manufacture of duplicate check, counterfoil, and like books. 228,410.
Schmidt, O. Cash books and account books. 228,340.

COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1925.

Cogery, H. E. D., and Bertrand, C. F. B. G. Loose-leaf binders. 228,541.

THE late Mr. William Keliher, of Bloomsbury-street, London, who left £28,072, gave £250 to the Printers' Pension Corporation.

The "Baby" Rotogravure Machine.

A not unnatural prejudice exists still in the minds of many printers against the use of rotogravure machines, as they are still under the impression that the prime cost is very high, that the cost of etching the rollers is very excessive, and that they are limited in use, as the sizes are strictly fixed.

All these difficulties have been overcome long ago, and the latest "Baby" rotogravure machine, which can now be inspected in the show-room of A. Edler, 78, Southwark-street, London, S.E.1, will be an eye opener to anybody who has so far had a prejudice against these machines. We understand from Mr. Edler that the cost of this machine does not exceed the price of a first class platen press. The machine can be used for sheets of any size, right up to the maximum, and the etching can be done by trade houses for prices not exceeding the cost of half-tone blocks.

As the small letterpress jobbing machine has been found indispensable in printing offices when the large high speed presses are occupied, so the need has arisen for a small fast-running cylinder machine, even for those rotogravure printers who are already equipped for large sheet and reel rotary-gravure machines. Owing to its low purchase price, this machine will also enable all classes of printers to think seriously of installing a machine for high class art work which cannot be attained by any other process.

The new "Baby" rotogravure machine takes any size sheet up to 15½ in. by 20½ in. The impression cylinder is very strong, and is placed above another cylinder covered by a copper sleeve, so that when changing from one job to another it is necessary only to change the etched copper sleeve. The proportion of the diameter of the impression cylinder and the copper cylinder is two to one. Both rest in very heavy bearings. The copper cylinder can easily be rolled out in order to exchange the copper sleeves. The inking apparatus and the doctor are most conveniently placed, being always just in front of the feeder. Lay marks of well proved construction guarantee the most exact register in connection with a superior gripper system, so that the machine is suitable for the production of finest register work and colour gravure printing.

The delivery of the sheet is effected at the back of the machine by a large drum fitted on the sheet holders, from which by means of a tape guide the sheet is alternatively guided to two delivery tables, printed side up. A handy impression throw-off puts the impression cylinder into or out of action.

In order to secure quick drying of the printing ink, the machine is heated at option by gas, steam or electricity, and in addition to this a blower is fitted, so that, even when printing at full speed, there is no risk of smearing the freshly-printed sheets. The usual speed of the machine is well over 2,000 per hour, but for large runs an automatic feeder can be provided, which considerably increases even this high output. The machine is usually driven by a three horse-power electric motor with a belt from the fly-wheel.

First class British and Continental houses have already installed the machine, and we think there will be many more visitors to Mr. Edler's show-room to see this interesting machine.

Lord Doverdale's Estate.

The Right Hon. Edward, First Baron Doverdale, of Westwood Park, Droitwich, Worcs, and late of Easton, Glossop, Derbyshire, chairman of Messrs. Olive and Partington, Ltd., papermakers, of Glossop, and a director of the Manchester and Liverpool District Banking Co., who died on January 5th, aged 88, left estate provisionally valued for probate at the round figure of £250,000 "so far as at present can be ascertained." The testator left all his property to his son Oswald, as to £120,000 to enable him to purchase the Westwood Park Estate, Droitwich, from the Partington Trust, Ltd., and requesting that this estate and the effects there should be held with the title, and as to the balance to his said son absolutely.

THE Lancashire and Cheshire Alliance are arranging one of their week-end rallies at Southport on March 20th, when the proceedings are expected to be of special interest.

"THE KELMSCOTT PRESS AND WILLIAM MORRIS, MASTER CRAFTSMAN." By H. Halliday Sparling. London: Macmillan and Co., Ltd., St. Martin's-street. Price, 18s. net.

Although it is nearly 30 years since William Morris passed away, his memory is still green with us, and his work more widely appreciated than when he was alive. An artist in many branches of craft, Morris seemed to be master of whatever he put his mind to, whether it was the designing of wall-paper or furniture, stained glass, tiles, tapestries and textiles, or the production of books—at all of which he wrought with his own hands. In every case he seemed to achieve the best that could be produced, whilst the arts of prose and poetry filled in the spare time of a life that was a very full and busy one. As a printer he has made an undying name for himself, and the beauty of his work and its perfect production are the admiration of collectors. Some there are who criticise his printed pages, and often justly, in respect of such matters as illegibility, heaviness and so; but even they must admit the design and balance of his books as things to be admired. Much has been written at various times about William Morris, but the issue of this book, written by his close friend and coadjutor, Mr. H. Halliday Sparling, should be welcomed by all who admire the work of the versatile genius. Mr. Sparling was the handy man of the Kelmscott Press from its inception to 1894, and so writes of the printed work of Morris with authority and gives us a fascinating insight into the way the riverside printery was run. How Morris designed his own types, and went also into ink-making, papermaking, and vellum-making is told by Mr. Sparling, and the inner history of the books produced at the Kelmscott Press forms most interesting reading. Morris detested commercialism, and as an admirer of his says: "The main idea of his later years was a hatred of the base commercialism which has degraded the ordinary workman from an artist into a machine, and has cheapened and demoralised and disfigured the whole fabric of modern civilisation. But this hatred was not sullen or stagnant; it accompanied an active ceaseless search for a social lever that would again raise the workman into the artist, and thereby bring dignity and simplicity and beauty into the ordinary everyday homes." The interest of this book is increased by facsimile reproductions of title pages and portions of the text from the principal of Morris's books. Most of these show the distinctiveness of design that was peculiar to the work of Morris, and give one some idea of the pains and skill that must have been put into their production. The details that are given of the methods of work in the Kelmscott Press will be perused with interest by the printer who is keen on his art, and the many personal anecdotes told of the master-craftsman help to show us what manner of man he was. The book is beautifully got up and delightfully printed on a fine paper. Indeed it reminds one of a Morris book and should, alike for its contents and its form, be a treasured addition to the library. A fine portrait of William Morris in his study forms the frontispiece of a volume of peculiar interest. Author, printer, publishers and all concerned with the production of the volume may be congratulated on the successful outcome of their labours.

A PRELIMINARY statement as to the contents of this year's British Empire Exhibition at Wembley contains the following regarding print in the Palace of Industry:—"A strong display by the printing and allied industries will be one of the chief attractions of the south-west corner of the Palace of Industry. In it will be included exhibits by typical printing, stationery, map-making and publishing firms."

MESSRS. R. A. BARTLETT, LTD., of 8, Hythe-road, London, N.W.10, send us a specimen showing an entirely new letterpress black ink which they have just introduced to the trade. It is a carbon black sold largely for ordinary jobbing and poster purposes and giving brilliant results. Another specimen shows Willesden Black, a superior magazine ink. Printers are offered free samples of both these inks, which can be supplied in bulk quantities at "bedrock prices."

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies,
Machinery for Sale and Wanted,
Businesses for Sale and Wanted,
Partnerships and Investments,
Miscellaneous.

One Insertion	**3/0**
Three Insertions	**6/0**

For every line exceeding three lines **6d.**

Situations Wanted.

Under this heading operatives are granted a Special Rate for a minimum of three lines (twenty-one words):—

One Insertion	**1/6**
Three Insertions	**3/0**

For every line exceeding three lines **6d**

Sales by Auction, Tenders,
Patents for Sale,
Legal and Financial Announcements

Rating of Machinery.

THE rating of machinery is a matter in respect of which the trades connected with paper and print, in common with others, have been labouring under severe injustices. Happily, there is hope of substantial relief in the report issued on Friday of the committee on the rating of machinery and plant in England and Scotland, appointed by the Ministry of Health in 1923. The chief recommendation as regards England is "that machinery users are entitled to relief, and . . . that relief should be given by partially exempting from rates a certain class only of machinery and plant." The other recommendations with regard to England are: "The present practice of excluding from valuation loose tools, loose plant, and machines operated only by hand or foot power to be definitely approved. Machinery and plant should be divided into two classes. The value of Class II should be apportioned out of the rateable value of the whole hereditament, and stated separately in the column of the valuation list now used for agricultural land. Class II should (in the case of any rate within the definition in Section 9 of the Agricultural Rates Act, 1896) pay only 25 per cent. of the full rate." We understand that a White Paper is being issued, and that the recommendations are to be incorporated in a Government Bill which will revise the whole system of rating and valuation.

* * *

Mail Order Catalogues.

THE remarkable development of the mail-order method of conducting retail sales trade is steadily creating a wide demand for paper of a new type. Generally, the mail-order concerns start up by advertising extensively in the daily, weekly and monthly Press. As they grow, they institute a catalogue to support the Press campaign. Eventually, with increasing custom, conditions change and the Press campaign becomes subsidiary to the catalogue. Finally, with the establishment of a regular clientele, the mail-order catalogue becomes all-important and in many cases Press advertising is dispensed with. New customers are attracted by a variety of methods, all centring round the catalogue. The catalogue is an ever-increasing unit and the cost of postage becomes a vital factor, especially when it is borne in mind that the big houses count their annual issue by the million.

* * *

Importance of Paper Weight.

THE weight of the paper used determines that of the booklet and in turn decides the cost of postage. An extra halfpenny often turns on the weight of the printer's ink, or the wrapper employed, and a halfpenny each on a million copies amounts to £2,083. So it will be seen that the selection of paper for bulky booklets is a serious matter. Essentially mail-order books must be a mass of pictures, including line and tone reproductions and the papermaker's problem is to produce a paper embodying thinness, light weight, opacity and a receptive printing surface. There are such papers on the market, we are aware, and not all of them are satisfactory. Certain American mills have almost solved the problem, as might be expected in a country which gave birth to the mail-order method and in which the scope for trade of that description is so infinitely vast as compared with our own. Actually the first standard to be reached is that of a double crown 18-19 lbs., to sell at a competitive commercial price. Such a paper would permit a demy 8vo. booklet of 144 pp., a crown 8vo. of 192 pp., or a crown 4to. of 96 pages, complete with cover and wrapper to go through the post for a penny. But for the producers of catalogues whose requirements are double and treble the above-mentioned, it remains to be seen whether anything in the nature of a cheap Bible printing with suitable surface can be developed.

Paper Standardisation.

Reference to the scheme for the standardisation of paper which has been initiated by the Federation of Master Printers is made in the February issue of that organisation's *Circular*. World-wide interest, it is stated, is being taken in the efforts of the Federation to secure a large measure of standardisation for paper. There is some prejudice on the part of the supplier to overcome, and also some not unreasonable objections, but there are indications that the goal is nearer.

It has been contended all along that in the average printing office ninety per cent. of the jobs break into reams. In other words, only ten per cent. of the jobs absorb self-contained bundles of paper. This statement has been challenged in several quarters, and received with incredulity in others. To prove its correctness or otherwise, one large firm were good enough to review thousands of jobs, and the results show that in this particular house eighty per cent. of the jobs broke into reams. The firm handle large jobs of all kinds, and are in a position to use the clause in the "Standard Conditions" referring to "overs" and "unders," but notwithstanding this position they did break reams to a large extent.

If, then, a large firm find it necessary to break reams to complete orders, the general commercial printer must be rather over than under the ninety per cent. referred to above.

With regard to traditional quantities, the writer adds: "Why do printers sell in such quantities that broken reams are common in every paper warehouse? The present reamage for writing paper is 480 sheets. It does appear strange that a job which cuts four out of a sheet should be sold by 1,000's, 2,500's, 5,000's, etc., when none of these quantities absorb complete reams of paper, and must leave overs. It would surely have been preferable, where possible, to sell by the ream, four out, six out, or eight out, as circumstances required, and use up the ream. When the 1,000-sheet basis is established, it should become a practice to sell by this standard, in even multiples rather than the odd ones, seeing that paper is invariably cut in quartos or octavos, and seldom in tens.

A Lecture on "Publishing."

"Unique" Gathering at Stationers' Hall.

"Publishing" was the subject of a lecture delivered by Mr. Geoffrey S. Williams (vice-president of the Publishers' Association) at Stationers' Hall on Friday evening last, the lecture being one of the series arranged by the Stationers' Company and Printing Industry Technical Board.

The chairman was Mr. C. F. Clay (president, Publishers' Association), who in introducing Mr. Williams made the interesting remark that he thought a lecture on publishing was a unique occurrence, as he had never heard a publisher lecture on the craft—or "mystery," as he would prefer to term it—of publishing. Mr. Clay went on to refer to Mr. Williams's important services to the Publishers' Association and to his knowledge of the book trade abroad.

Mr. Williams's lecture did not, as previous lectures in this series might have led one to expect, lay stress on that side of publishing on which the publisher comes into contact with the printer. Rather was it an informative outline of the functions, methods and tendencies of the publishing trade of to-day.

After narrowing down his subject to make it cover book publishing only, the lecturer referred to the close relationship existing between publishing and book production on the one hand and publishing and bookselling on the other. He refrained from an historical retrospect, but remarked: "As the number of books issued annually increased and the problem of their distribution became more complicated with the spread of the market for the books all over the world, it was only natural that the business of arranging with the author, of supervising the production of the book, and its wholesale distribution, should gradually separate from that of displaying the book to the public for the purposes of retail sale, just as the actual printing of the books has separted from publishing and bookselling and become a distinct business. At the present time very few book publishing houses own a printing works, and those that do are usually magazine as well as book publishers."

Proceeding to indicate the importance of the publisher's function in the process of book creation, production and distribution, Mr. Williams said: "At the one end there is the author, obviously the creator of the book; at the other you have the bookseller, equally obviously the distributor, in direct touch with the reader, the consumer—and one may say that everything else connected with books is the publisher's job"—the printer, presumably, being regarded merely as a servant of the publisher, and not deserving of mention as a distinct link in the chain. The speaker added that he thought that on the whole the best and truest description of the publisher was "the adventurer" of the book trade, forming the centre figure in the book trade trinity of creator, adventurer and distributor. Mr. Williams stressed the fact that, in venturing books upon the market, the publisher often put his desire to serve the community before the desire to make a profit.

The lecturer then entered upon an instructive and interesting survey of internal organisation of the publishing trade at home and abroad, showing the effectiveness of close organisation in maintaining the published price and preventing underselling. A point of special interest to the printer and binder was the statement that it is the "sale or return" system in operation between publishers and booksellers on the Continent that makes paper covers and uncut edges an absolute necessity over there, for the publisher will not take back a book whose cut edges show that it has been read.

As to co operation between publisher and printer, Mr. Williams insisted that it must be "the publisher who prescribes the format of the book, the type to be used, and the style of the binding. He can go to the printer, or the binder, for expert advice as to how his ideas can be carried out, but he himself must have sufficient general knowledge of these crafts to be able to interpret his ideas to the experts and to judge whether they are within the bounds of practical politics. You need only compare the books issued by various publishing houses to see the truth of what I have just said. Some, you will find, might have been turned out by just anybody, others have a style which is unmistakeable — printing, paper, binding and subject matter seem to blend harmoniously together to make an attractive whole. Such books are evidence of this intelligent co-operation between the editorial and production sides in the publisher's office."

"But please don't think," Mr. Williams added, "that I want to suggest that it is no use for printers or binders to study the artistic side of their crafts or place their ideas before the publishers. It is always a greater pleasure to deal with a good craftsman than with someone who does not care, so that such study will be bound to be to the advantage of the printer or binder in the long run. I merely want to point out that the prime responsibility for and final decision in these matters must rest with the publisher."

The necessity for accurate and detailed costing was one of the points made in reviewing the various departments of the publisher's business. The lecture closed with some sound observations upon the importance of books—particularly those embodying intellectual, scientific or technical attainments—for advancing the interests of this country at home and abroad.

After a short discussion, in which the chairman, Mr. Frank A. Denny (chairman, Associated Booksellers) and Mr. Frank Colebrook joined, the meeting passed a cordial vote of thanks to the lecturer, the proposer being Mr. H. Scheumier (T. Nelson and Sons, Ltd.), and the seconder Mr. Denny.

The meeting closed with a vote of thanks, given at the call of Mr. Williams, to Mr. Clay for his services in the chair.

MESSRS. A. M. PEEBLES AND SON, LTD., are producing a very excellent superfine white art paper under the title of "Model." It is a high grade paper for high-grade printing and is stocked in a variety of sizes and substances. The reputation of this old-established papermaking firm for the production of paper of distinction is enhanced by this latest effort. The printing qualities of "Model" art are well demonstrated in the specimen before us by the reproduction in delicate colours of a painting by Roland Green, the striking effect of the original painting being faithfully conveyed.

MESSRS. JOHN DICKINSON AND CO., LTD., have issued sample sets of their striking Aurora covers in seven bold colours, together with bargain sets of glazed tinteds, etc.

B. Winstone and Sons, Ltd.

Staff Dinner.

The annual dinner to senior members of the staff, given by B. Winstone and Sons, Ltd., was held recently in the Knights Room, Simpsons-in-the-Strand, thirty-five members of the staff being present.

In the absence of the managing director, Mr. W. Muirsmith, J.P., Mr. Eric W. Muirsmith occupied the chair and was supported by his co-directors, Mr. F. R. Briant and Mr. A. L. Thomson.

The toast of "The King," given by the chairman, was loyally received, and the vice-chairman, Mr. Martin, next proposed "The Firm," to which the chairman replied.

Mr. F. Sheridan, country sales manager, proposed "The Manufacturing Staff," Mr. H. Smith responding, and Mr. A. L. Thomson proposed "The Selling Staff," to which Mr. J. Garner replied.

During the evening a presentation was made to Mr. S. H. Halford on his retirement from the firm after 33 years' service. The presentation took the form of a solid silver tea service, and this was handed to Mr. Halford by Mr. F. R. Briant, who, in an admirable speech, recounted Mr. Halford's long association with the company and the kindly feeling felt towards him by all his colleagues.

An excellent dinner, followed by a musical programme, was provided, and altogether the evening was a very enjoyable one. Noticeable in all the speeches was the good feeling that prevails throughout the house of Winstone, which is in its 77th year, and is now looking forward to another year of progress and prosperity.

Costing Clerks & the 1921 Census.

The results of the Census taken in 1921 are gradually being issued, and it is interesting to note that the costing movement in the printing trade has led to a special classification. In the different sections of the industry figures are given of "clerks (not costing clerks)," and in some sections there is a special classification "costing and estimating clerks." It is probable that many of the clerks (not costing clerks) are doing a considerable amount of estimating, but it is encouraging to those interested in the costing movement in the printing trade that in the eight years since the System was started (viz., 1913 to 1921, the year of the Census) the categories in the Census have to be changed so as to show separately the specialists on costing and estimating. It is probable that in the Census for 1931 the number of costing and estimating clerks will have considerably increased, which will be greatly to the benefit of the printing industry.

ROCHDALE and District Printing Crafts Guild were ambitious when they engaged the large hall of the Town Hall, Rochdale, for their whist drive and dance recently. The large hall was well filled with dancers and the party was a big success. Excellent prizes were given for whist and dancing. The Guild Orchestra supplied the music.

Rating of Machinery.

THE rating of machinery is a matter in respect of which the trades connected with paper and print, in common with others, have been labouring under severe injustices. Happily, there is hope of substantial relief in the report issued on Friday of the committee on the rating of machinery and plant in England and Scotland, appointed by the Ministry of Health in 1923. The chief recommendation as regards England is "that machinery users are entitled to relief, and . . . that relief should be given by partially exempting from rates a certain class only of machinery and plant." The other recommendations with regard to England are: "The present practice of excluding from valuation loose tools, loose plant, and machines operated only by hand or foot power to be definitely approved. Machinery and plant should be divided into two classes. The value of Class II should be apportioned out of the rateable value of the whole hereditament, and stated separately in the column of the valuation list now used for agricultural land. Class II should (in the case of any rate within the definition in Section 9 of the Agricultural Rates Act, 1896) pay only 25 per cent. of the full rate." We understand that a White Paper is being issued, and that the recommendations are to be incorporated in a Government Bill which will revise the whole system of rating and valuation.

Mail Order Catalogues.

THE remarkable development of the mail-order method of conducting retail sales trade is steadily creating a wide demand for paper of a new type. Generally, the mail-order concerns start up by advertising extensively in the daily, weekly and monthly Press. As they grow, they institute a catalogue to support the Press campaign. Eventually, with increasing custom, conditions change and the Press campaign becomes subsidiary to the catalogue. Finally, with the establishment of a regular clientele, the mail-order catalogue becomes all-important and in many cases Press advertising is dispensed with. New customers are attracted by a variety of methods, all centring round the catalogue. The catalogue is an ever-increasing unit and the cost of postage becomes a vital factor, especially when it is borne in mind that the big houses count their annual issue by the million.

Importance of Paper Weight.

THE weight of the paper used determines that of the booklet and in turn decides the cost of postage. An extra halfpenny often turns on the weight of the printer's ink, or the wrapper employed, and a halfpenny each on a million copies amounts to £2,083. So it will be seen that the selection of paper for bulky booklets is a serious matter. Essentially mail-order books must be a mass of pictures, including line and tone reproductions and the papermaker's problem is to produce a paper embodying thinness, light weight, opacity and a receptive printing surface. There are such papers on the market, we are aware, and not all of them are satisfactory. Certain American mills have almost solved the problem, as might be expected in a country which gave birth to the mail-order method and in which the scope for trade of that description is so infinitely vast as compared with our own. Actually the first standard to be reached is that of a double crown 18-19 lbs., to sell at a competitive commercial price. Such a paper would permit a demy 8vo. booklet of 144 pp., a crown 8vo. of 192 pp., or a crown 4to. of 96 pages, complete with cover and wrapper to go through the post for a penny. But for the producers of catalogues whose requirements are double and treble the above-mentioned, it remains to be seen whether anything with suitable surface can be developed.

Paper Standardisation.

Reference to the scheme for the standardisation of paper which has been initiated by the Federation of Master Printers is made in the February issue of that organisation's *Circular*. World-wide interest, it is stated, is being taken in the efforts of the Federation to secure a large measure of standardisation for paper. There is some prejudice on the part of the supplier to overcome, and also some not unreasonable objections, but there are indications that the goal is nearer.

It has been contended all along that in the average printing office ninety per cent. of the jobs break into reams. In other words, only ten per cent. of the jobs absorb self-contained bundles of paper. This statement has been challenged in several quarters, and received with incredulity in others. To prove its correctness or otherwise, one large firm were good enough to review thousands of jobs, and the results show that in this particular house eighty per cent. of the jobs broke into reams. The firm handle large jobs of all kinds, and are in a position to use the clause in the "Standard Conditions" referring to "overs" and "unders," but notwithstanding this position they did break reams to a large extent.

If, then, a large firm find it necessary to break reams to complete orders, the general commercial printer must be rather over than under the ninety per cent. referred to above.

With regard to traditional quantities, the writer adds: "Why do printers sell in such quantities that broken reams are common in every paper warehouse? The present reamage for writing paper is 480 sheets. It does appear strange that a job which cuts four out of a sheet should be sold by 1,000's, 2,500's, 5,000's, etc., when none of these quantities absorb complete reams of paper, and must leave overs. It would surely have been preferable, where possible, to sell by the ream, four out, six out, or eight out, as circumstances required, and use up the ream. When the 1,000-sheet basis is established, it should become a practice to sell by this standard, in even multiples rather than the odd ones, seeing that paper is invariably cut in quartos or octavos, and seldom in tens.

A Lecture on "Publishing."

"Unique" Gathering at Stationers' Hall.

"Publishing" was the subject of a lecture delivered by Mr. Geoffrey S. Williams (vice-president of the Publishers' Association) at Stationers' Hall on Friday evening last, the lecture being one of the series arranged by the Stationers' Company and Printing Industry Technical Board.

The chairman was Mr. C. F. Clay (president, Publishers' Association), who in introducing Mr. Williams made the interesting remark that he thought a lecture on publishing was a unique occurrence, as he had never heard a publisher lecture on the craft—or "mystery," as he would prefer to term it—of publishing. Mr. Clay went on to refer to Mr. Williams's important services to the Publishers' Association and to his knowledge of the book trade abroad.

Mr. Williams's lecture did not, as previous lectures in this series might have led one to expect, lay stress on that side of publishing on which the publisher comes into contact with the printer. Rather was it an informative outline of the functions, methods and tendencies of the publishing trade of to-day.

After narrowing down his subject to make it cover book publishing only, the lecturer referred to the close relationship existing between publishing and book production on the one hand and publishing and bookselling on the other. He refrained from an historical retrospect, but remarked: "As the number of books issued annually increased and the problem of their distribution became more complicated with the spread of the market for the books all over the world, it was only natural that the business of arranging with the author, of supervising the production of the book, and its wholesale distribution, should gradually separate from that of displaying the book to the public for the purposes of retail sale, just as the actual printing of the books has separted from publishing and bookselling and become a distinct business. At the present time very few book publishing houses own a printing works, and those that do are usually magazine as well as book publishers."

Proceeding to indicate the importance of the publisher's function in the process of book creation, production and distribution, Mr. Williams said: "At the one end there is the author, obviously the creator of the book; at the other you have the bookseller, equally obviously the distributor, in direct touch with the reader, the consumer—and one may say that everything else connected with books is the publisher's job"—the printer, presumably, being regarded merely as a servant of the publisher, and not deserving of mention as a distinct link in the chain. The speaker added that he thought that on the whole the best and truest description of the publisher was "the adventurer" of the book trade, forming the centre figure in the book trade trinity of creator, adventurer and distributor. Mr. Williams stressed the fact that, in venturing books upon the market, the publisher often put his desire to serve the community before the desire to make a profit.

The lecturer then entered upon an instructive and interesting survey of internal organisation of the publishing trade at home and abroad, showing the effectiveness of close organisation in maintaining the published price and preventing underselling. A point of special interest to the printer and binder was the statement that it is the "sale or return" system in operation between publishers and booksellers on the Continent that makes paper covers and uncut edges an absolute necessity over there, for the publisher will not take back a book whose cut edges show that it has been read.

As to co operation between publisher and printer, Mr. Williams insisted that it must be "the publisher who prescribes the format of the book, the type to be used, and the style of the binding. He can go to the printer, or the binder, for expert advice as to how his ideas can be carried out, but he himself must have sufficient general knowledge of these crafts to be able to interpret his ideas to the experts and to judge whether they are within the bounds of practical politics. You need only compare the books issued by various publishing houses to see the truth of what I have just said. Some, you will find, might have been turned out by just anybody, others have a style which is unmistakeable — printing, paper, binding and subject matter seem to blend harmoniously together to make an attractive whole. Such books are evidence of this intelligent co-operation between the editorial and production sides in the publisher's office."

"But please don't think," Mr. Williams added, "that I want to suggest that it is no use for printers or binders to study the artistic side of their crafts or place their ideas before the publishers. It is always a greater pleasure to deal with a good craftsman than with someone who does not care, so that such study will be bound to be to the advantage of the printer or binder in the long run. I merely want to point out that the prime responsibility for and final decision in these matters must rest with the publisher."

The necessity for accurate and detailed costing was one of the points made in reviewing the various departments of the publisher's business. The lecture closed with some sound observations upon the importance of books—particularly those embodying intellectual, scientific or technical attainments—for advancing the interests of this country at home and abroad.

After a short discussion, in which the chairman, Mr. Frank A. Denny (chairman, Associated Booksellers) and Mr. Frank Colebrook joined, the meeting passed a cordial vote of thanks to the lecturer, the proposer being Mr. H. Scheumier (T. Nelson and Sons, Ltd.), and the seconder Mr. Denny.

The meeting closed with a vote of thanks, given at the call of Mr. Williams, to Mr. Clay for his services in the chair.

Messrs. A. M. Peebles and Son, Ltd., are producing a very excellent superfine white art paper under the title of "Model." It is a high grade paper for high-grade printing and is stocked in a variety of sizes and substances. The reputation of this old-established papermaking firm for the production of paper of distinction is enhanced by this latest effort. The printing qualities of "Model" art are well demonstrated in the specimen before us by the reproduction in delicate colours of a painting by Roland Green, the striking effect of the original painting being faithfully conveyed.

Messrs. John Dickinson and Co., Ltd., have issued sample sets of their striking Aurora covers in seven bold colours, together with bargain sets of glazed tinteds, etc.

B. Winstone and Sons, Ltd.

Staff Dinner.

The annual dinner to senior members of the staff, given by B. Winstone and Sons, Ltd., was held recently in the Knights Room, Simpsons-in-the-Strand, thirty-five members of the staff being present.

In the absence of the managing director, Mr. W. Muirsmith, J.P., Mr. Eric W. Muirsmith occupied the chair and was supported by his co-directors, Mr. F. R. Briant and Mr. A. L. Thomson.

The toast of "The King," given by the chairman, was loyally received, and the vice-chairman, Mr. Martin, next proposed "The Firm," to which the chairman replied.

Mr. F. Sheridan, country sales manager, proposed "The Manufacturing Staff," Mr. H. Smith responding, and Mr. A. L. Thomson proposed "The Selling Staff," to which Mr. J. Garner replied.

During the evening a presentation was made to Mr. S. H. Halford on his retirement from the firm after 33 years' service. The presentation took the form of a solid silver tea service, and this was handed to Mr. Halford by Mr. F. R. Briant, who, in an admirable speech, recounted Mr. Halford's long association with the company and the kindly feeling felt towards him by all his colleagues.

An excellent dinner, followed by a musical programme, was provided, and altogether the evening was a very enjoyable one. Noticeable in all the speeches was the good feeling that prevails throughout the house of Winstone, which is in its 77th year, and is now looking forward to another year of progress and prosperity.

Costing Clerks & the 1921 Census.

The results of the Census taken in 1921 are gradually being issued, and it is interesting to note that the costing movement in the printing trade has led to a special classification. In the different sections of the industry figures are given of "clerks (not costing clerks)," and in some sections there is a special classification "costing and estimating clerks." It is probable that many of the clerks (not costing clerks) are doing a considerable amount of estimating, but it is encouraging to those interested in the costing movement in the printing trade that in the eight years since the System was started (viz., 1913 to 1921, the year of the Census) the categories in the Census have to be changed so as to show separately the specialists on costing and estimating. It is probable that in the Census for 1931 the number of costing and estimating clerks will have considerably increased, which will be greatly to the benefit of the printing industry.

Rochdale and District Printing Crafts Guild were ambitious when they engaged the large hall of the Town Hall, Rochdale, for their whist drive and dance recently. The large hall was well filled with dancers and the party was a big success. Excellent prizes were given for whist and dancing. The Guild Orchestra supplied the music.

DIVIDENDS AND REPORTS.

SUNDAY PICTORIAL.—Interim dividend on ordinary shares of 6¼ per cent. actual, less tax at 4s. 6d. in £, payable March 3rd. (Last year, dividend, same).

DAILY MIRROR NEWSPAPERS. — Interim dividend on ordinary shares of 7½ per cent. actual, less tax at 4s. 6d. in £, payable March 3rd. (Dividend last year, same).

"COUNTRY LIFE."—For the year 1924 a net profit of £25,120 is shown, against £25,534 for 1923. Last year's transfer of £3,000 to reserve is repeated, and the ordinary dividend is again 12½ per cent. (including 5 per cent. already paid). The carry forward is £15,770, against £11,650 (after deducting bonuses voted at general meeting, 1924), brought in.

NEW COMPANIES.

C. F. ROWORTH, LTD – Capital £10,000, in £1 shares; to acquire the interest of Catherine Wilbraham and G. F. Wilbraham in the stock-in-trade, plant and other assets relating to the business of printers and publishers carried on at 98, Fetter-lane, E.C., and to carry on the same and the business of stationers, photo-lithographers, colour process and half-tone engravers, etc. Private company. First directors: Mrs. Catherine Wilbraham, G. F. Wilbraham and Charlotte A. Wilbraham. Registered office: 88, Fetter lane, E.C.2.

WILLIAM HOUGH AND SONS, LTD.—Capital £10,000, in £1 shares; to acquire the business of manufacturing, wholesale and retail stationers, printers, bookbinders and publishers carried on by C. P. Hough at 2, Swan-court, Market-street, Manchester, as "Wm. Hough and Sons." Private company. Subscribers: C. P. Hough, C. P. Hough, Jun., and Mrs. E. Hough.

F. BAILEY AND SON, LTD. — Capital £10,000, in £1 shares (5,000 ord. and 5,000 seven per cent. cum. pref); to acquire the business carried on at Dursley, Gloucester, as "F. Bailey and Son," and to carry on the business of proprietors and publishers of newspapers, journals, magazines, books and other literary works, etc. Private company. Subscribers: F. G. Bailey, E. H. Nowth and Elizabeth Bailey. Registered office: The Printing Works, Kingshill-road, Dursley.

EDWARDS AND CLEAVE, LTD.—Capital £2,000, in £1 shares; to acquire the goodwill and connection in trade of a paper and board agent belonging to T. G. Edwards, of 23, Thornsbeach-road, Catford, and to carry on the business of paper and/or board agents, manufacturers of and dealers in paper, cardboard, pulp, bags, string, rags and materials for papermaking, fancy goods and stationery, printers, lithographers, engravers, die sinkers, machine rulers, numerical printers, stationers, envelope manufacturers, etc. Private company. First directors: T. G. Edwards and A. Cleave. Registered office: 75, Knightrider-street, E.C.4.

PEARSON, PICKUP AND CO, LTD.—Capital £1,500, in £1 shares; to acquire the business of general printers and wholesale paper merchants carried on by Pearson and Pickup at 66A, Eastbourne-road, Birkdale, Southport, and to carry on the same and the business of manufacturing stationers, boxmakers, newsagents, dealers in fancy goods, etc. Private company. First directors: J. Pickup and C. Pearson. Registered office: 66A, Eastbourne-road, Birkdale, Southport.

FRANCIS, DAY AND HUNTER, LTD.—Capital £60,000, in £1 shares (17,500 8 per cent. cum. pref. and 42,500 ord.); to adopt an agreement with D. G Day and F. E. M. Day, and to carry on the business of music publishers formerly carried on by them at 138-140, Charing Cross-road, W.C., and elsewhere, as "Francis, Day and Hunter." Private company. First directors: D. G. Day, F. E. M. Day, J. Abbott and R. S. Low. Registered office: 138-140, Charing Cross-road, W.C.2.

ANGLO AMERICAN ART PRINTING SYNDICATE, LTD.—Capital £100, in 1s. shares; to adopt an agreement with I. A. Keene, E. J. Wood and A. Spero, and to carry on the business of printers, publishers, lithographers, advertising agents and contractors, general distributing agents, and bill posters, etc. Private company. First directors: I. A. Keene. E. J. Wood and A. Spero. Registered office: 5, John-street, Bedford-row, W.C.1.

ERNEST G. WHITE SERVICE, LTD.—Capital £1,000, in £1 shares; to acquire the business of advertising agents and contractors, printers, stationers and artists now carried on as the "Ernest G. White Service" at 24, Longston-buildings, Cannon-street, Manchester, and Park Works, Cooke-street, Old Trafford, Manchester. Private company. First directors: E. G. White and E. A Lloyd.

LAMPORT GILBERT AND CO., LTD. — Capital £1,500 in £1 shares; to acquire the business of a printer, bookbinder, die stamper and stationer, carried on by J. E. L. Gilbert, at Minster-street, Reading, as "Lamport Gilbert and Co." Private company. Directors: J. E. L. Gilbert and H. F. N. Powell.

CONTINENTAL "DAILY MAIL" SOCIETE ANONYME.—Capital 1,300,000 francs in 13,000 shares of 100 francs each. Directors: W. L. Warden, C. A. Pfister, J. F. C. Kruse and P. A. Gondin. The British address is 130, Fleet-street, E.C., where C. F. Truefitt, accountant, is authorised to accept service of process and notices on behalf of the company.

ENGRAVOGRAPH, LTD.—Capital £20,000, in £1 shares; to adopt an agreement between C. L. Allen of the one part and L. H. Bentall and H. E. Fern of the other part; to acquire the business of a manufacturer of or dealer in engraving machines, carried on by C. L. Allen at 67, Chancery-lane, W.C.2, as the "Engravograph Company." Private company. First directors: C. L. Allen, L. H. Bentall and H. E. Fern, J.P. Registered office: 66, Finsbury-pavement, E.C.2.

GREENWOODS (BILLPOSTING), LTD.—Capital £1,000, in £1 shares; to acquire that part of the business of G. W. Greenwood and Co., advertising contractors and agents and bill-posters, as shall have been carried on in the Western Districts. Private company. First directors: W. Ramsden and H. H. Greenwood.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

BUCK AND WOOTTON, LTD. (printers, etc., London).—Satisfaction in full on February 2nd, 1925, of debentures dated September 22nd, 1909, securing £900.

GILCHRIST BROS., LTD. (photo process engravers, etc.).—Mortgage dated February 3rd, 1925, to secure £3,000, charged on certain freehold property in Brunswick-terrace, Leeds. Holders: D., I. and C. Joseph, all of Leeds.

GILBT. WHITEHEAD AND CO., LTD. (art colour printers, etc., London and now Eltham). —Agreement dated January 27th, 1925 (supplemental to mortgage dated March 20th, 1918), securing an increased rate of interest on £10,500 outstanding, charged on certain property at Eltham. Holders: Lloyds Bank, Ltd., to whom the principal mortgage has been transferred.

CASTER AND JELLEY, LTD. (printers, booksellers, etc., Peterborough).—Particulars filed of £2,000 debentures authorised February 2nd, 1925, charged on the company's property, present and future, including uncalled capital, but excluding real property, the whole amount being now issued.

WOOD WESTWORTH AND CO., LTD. (stationers, printers, etc.)—Mortgage on 23 and 23A, Hardshaw street, and Claughton Chambers, 3, Claughton-street, St. Helens, dated January 28th, 1925, to secure all moneys due or to become due from the company to the Westminster Bank, Ltd. Also mortgage dated January 29th, 1925, to secure £2,250, charged on the above-mentioned properties. Holders: J. Wood, V. Wood and W. Wood, St. Helens, Lancs.

DEVON AND CORNWALL BILLPOSTING AND ADVERTISING CO., LTD.—Mortgage on 2, Flora-street, Plymouth, with fixtures, etc., dated January 21st, 1925, to secure all moneys due or to become due from the company to the National Provincial Bank, Ltd.

CONTRACTORS' RECORD, LTD.—Particulars filed of £1,500 second debentures authorised January 1st, 1925, charged on the company's unde-taking and property, present and future, including uncalled capital, the whole amount being now issued.

SIMPSON MANSFIELD AND CO., LTD. (engravers, etc., Clerkenwell).—Particulars filed of £1,000 debentures authorised January 12th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital (if any), the whole amount being now issued.

THEATRICAL PUBLICATIONS, LTD. (London.) —Mortgage dated January 31st, 1925, to secure £6,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Walbrook Trust, Ltd., Bush House, Aldwych, W.C.

GREENFIELD AND CO, LTD. (cardboard box manufacturers, etc.).—Deposit (without instrument) on January 28th, 1925, of deeds of freehold land and premises in Dickinson-street and Wilfrid-street, Salford, to secure all moneys due or to become due from the company to Williams Deacons Bank, Ltd.

RECEIVER APPOINTED OR RELEASED

ERA, LTD. (London).—L. Nicholas, of 19, Castle-street, Liverpool, chartered accountant, was appointed receiver and/or manager on February 4th, 1925, under powers contained in debentures dated August 29th, 1923.

BANKRUPTCIES, etc.

Re SAMSON (LONDON), LTD, stationers, 120, Cheapside, E.C.—Under a compulsory, winding up order made against this company on December 17th, 1924, the statutory first meetings of the creditors and shareholders were held on February 10th at the Board of Trade Offices, Carey street, W.C. The official receiver reported that the company was incorporated as a private company on March 5th, 1924, with a nominal capital of £3,000, to carry on the business of stationers. It had no working capital at its inception, and appeared to have carried on a precarious business. The deficiency account attached to the statement of affairs showed a gross profit of £377; the overhead charges amounted to £1,457, and were out of all proportion to the trading

Digitized by Google

results. The above gross profit, however, was arrived at after taking the stock on hand at £1,000, but the stock was in fact estimated to realise £350 which would mean a gross loss on trading of £272. A receiver for the debenture holder who was appointed in August last had realised the remainder of the company's effects, and collected a certain number of book debts. He had reported that it was doubtful whether there would be sufficient to discharge the debenture debt in full. In the opinion of the official receiver the failure of the company was due to the fact that it had no proper working capital at the inception of its business, and to mismanagement. The statement of affairs showed gross liabilities £2,333, of which £1,733 was unsecured, the assets were estimated to realise £581. The liquidation was left in the hands of the official receiver.

Aberdeen Newspapers, Ltd.

The second annual meeting of Aberdeen Newspapers, Ltd., was held in Aberdeen, Mr. Duff, of Meldrum, chairman of the board of directors, presiding. The chairman said that the period under review had been one of consolidation and advance. During the past year the board had disposed of the Union-street premises. The premises at 16, Broad-street had been completely refitted inside. Provision had been made for housing the three large printing presses removed from the Union-street premises. To enlarge the accommodation for the storage of paper, a new building was constructed on part of their site adjoining Chronicle-court, thus giving them a large store of two floors. It was intended to increase still further the storage room for paper so that the large needs of the company in that direction might be provided for as far as possible. Another important alteration was at present approaching completion which would provide them with a much enlarged and improved composing department, the urgent need of which had been much felt of late.

MESSRS. MARTIN, Weaver and Nurse, Ltd., 11, Queen Victoria-street, have issued a neat and useful monthly calendar.

Lanston Monotype Corporation.

Optimistic Outlook.

At the seventeenth annual general meeting of the Lanston Monotype Corporation, held on Monday in London, Lord Askwith, K.C.B., K.C. (acting chairman), presided.

The Chairman, in the course of his remarks, said that up to September 30th they had in England a reduction in sales of about 7 per cent., but that was considerably counteracted by increased sales upon the Continent, particularly in Germany, and also in the Colonies. Since September—and he gave them that as a reason why he confidently suggested that the dividend recommended should be paid—the spurt had been good, and they had been selling a considerable number of machines. Their works were now fully occupied, and he would foreshadow with more confidence than he had done for some years that the present spurt in their industry indicated an improvement in trade. Their works had been improved, and they had put down an engine house and a generator. They had made certain improvements in machines, some of which by a comparatively early date would be incorported, and they had also produced some very remarkable and beautiful faces of type, based on some of the best examples of the fifteenth and sixteenth centuries.

In accordance with the statement at their last meeting, they had formed small subsidiary companies in South Africa and in Germany, the shares of which were entirely held by that company, while they had continued to maintain close co-operation with their colleagues in America.

He had mentioned that they had sold more machines in Germany. Of course, during the war they were precluded from selling any machines or any parts of machines in that country, and certain people in Germany, in view of these circumstances, took upon themselves to infringe the company's patents. Those people had been proceeded against and a number of actions had been fought and won by the company, and there were certain others which they hoped to win. This would prevent a continued infringement taking place, and he thought, altogether, that the German printers were on their side.

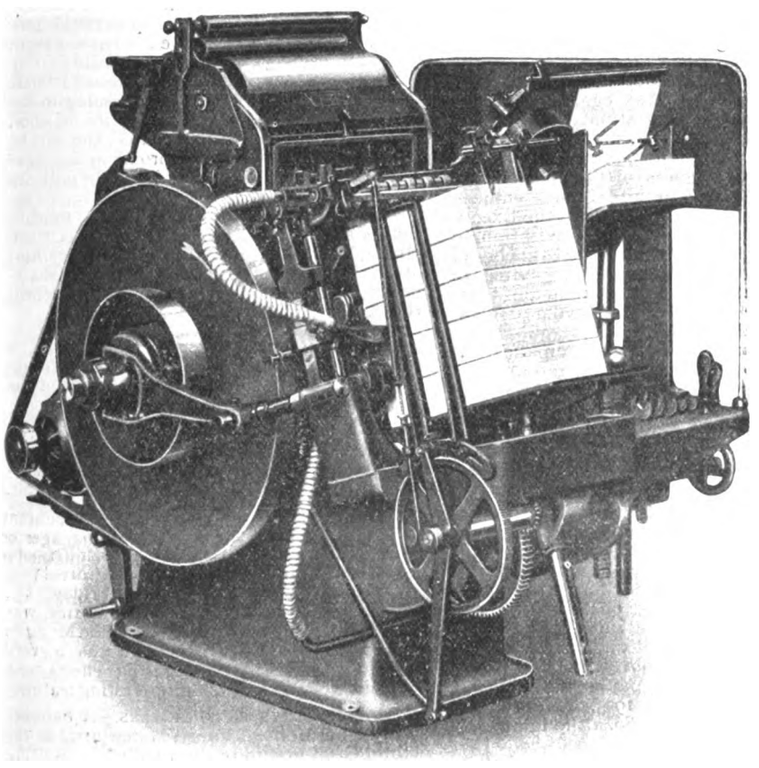
From the London Gazette.

PARTNERSHIPS DISSOLVED.

H. A. Jenkins, S. James and A. Low, printers and stationers, 18, Park-street, Nottingham, under the style of Jenkins, James and Low, so far as regards A. Low.

W. A. Rowbottom, E. W. V. Uncle and F. G. Porter, general and commercial printers and stationers, 83, Sydenham-road, Sydenham, under the style of the Sydenham Press.

F. Benson and T. Tierney, embossed ticket and showcard specialists, 21, Claypath, Durham, under the style of Benson and Tierney.



THE BANKRUPTCY ACT, 1914.

RECEIVING ORDER.

A. W. Barrett, 37, King-street, Covent-garden, London, publisher.

FROM the London School of Printing and Kindred Trades there comes a copy of the School calendar, the main feature of which is a photo-litho-offset print on a large piece of hand-made paper (about imperial folio size), appropriately mounted upon grey. The subject is an unfinished drawing by E. Herbert Whydale, A.R.E. For use as a wall decoration, as seems intended, so faint a subject would seem to be scarcely suitable, yet the print is a delightful example of what photo-litho offset can do in reproducing, even on paper of comparatively rough surface, the most delicate touches of an artist's pencil. The printing by this up-to-date process is excellently done (the handsome hand made paper, by the way, being kindly supplied by Messrs. J. Barcham Green and Son), and the whole production does credit to the School. Also sent are two well printed letterpress booklets, the *L.S.P. Record* and collection of Press reviews of the work of the L.S.P.

THE manufacture of cigarette boxes, a new industry in Egypt, has remarkably developed and now occupies more than 10,000 workers. The cardboard imported in 1923 amounted to 6,221,747 kilogs.

"The Platen that is revolutionising Jobbing Work."

THE HEIDELBERG AUTOMATIC PLATEN

The Heidelberg came—was seen—and it conquered in no uncertain fashion. In two short weeks sales have soared to a figure we would have been content with after three months' trading.

Printers from all parts have investigated. Their unanimous criticism—if it can be termed such—has been directed at the remarkable price at which the machine has been offered.

We believe in meeting criticism. The price of the Heidelberg is now raised to £185—*but*, and it is a very big BUT indeed, we are making additions to the machine equivalent in value to at least £15.

The latest Heidelberg model at £185 is, with its additions, even better value than the £175 model despite the lower price.

On the latest Heidelberg there is a unique sheet counting apparatus— the value of which will be appreciated by any printer. There will be an additional steel rider to the inking rollers and a special brake feed control.

These are the "reasons why" for the £10 increase. We think they are substantial, and NOW—HERE IS OUR BIG OFFER.

If you place your order for a new Heidelberg Automatic before March 1st we will accept it at the old price of £175 for delivery in strict rotation, fitted complete with newest additions.

After March 1st. the price is definitely advanced to **£185.** At this figure it is still unapproachable value, but—please remember, the sooner we have your order, the sooner you will obtain delivery.

Price of Model £185 See Special Offer.

HEIDELBERG PLATEN CO., 26 LONG ACRE, LONDON. W.C.2.

Personal.

MR. J. R. SCOTT (ex president) and Mr. Valentine Knapp (vice-president), of the Newspaper Society, have been re-elected as the Society's representatives on the National Confederation of Employers' Organisations.

THE annual general meeting of the Irish Master Printers' Association held in Dublin elected the following:—President, Mr. J. F. O'Hanlon, Cavan; vice-president. Mr. A. W. Emerson, Banbridge; delegate to London Federation Council, Mr. D. S. Irvine, Londonderry; hon. sec. Mr. T. F. McGahon, Dundalk.

THE Associated Irish Newspapers have elected the following members to hold office during the current year:—Mr. T. F. McGahon, Dundalk; vice president, Mr. J. F. O'Hanlon, Cavan; hon. treasurer, Mr. E. T. Keane, Kilkenny; and hon. secretary, Mr. T. J. W. Kenny, Galway.

MR. T. F. HOWARD, a member of the London Master Printers' Association, on the committee of the Rulers and Binders' Section and on the executive of the Central Districts Branch, is a candidate for South Islington at the forthcoming London County Council Election in the Municipal Reform interest He was the Conservative candidate for the same division at the recent Parliamentary Election.

MR. W. J. SANDIFORD, printer, of Chorley, Manchester, has been elected president of the Chorley Chamber of Trade. Mr. Sandiford formerly served as president for a term of three years.

MR. JOHN SEVER, a retired Manchester master printer, is a candidate for a vacancy on the Manchester City Council.

MR. W. C WARREN (general secretary of the National Society of Electrotypers and Stereotypers) put forward some very useful suggestions in dealing with the subject of health conditions in the foundry before the Electrotypers and Stereotypers Managers and Overseers' Association at 80, Blackfriars-road, on Monday evening. A report of the lecture will appear in next week's issue.

MR. J. THORP gave a lecture entitled "The Principles of Design as Applied to Books and Printing" at the London School of Economics, Houghton street, Aldwych, on Wednesday.

MR. G. H. PALMER lectures on "Book Bindings at the Victoria and Albert Museum, South Kensington, to-day (Thursday).

MR. JOHN B. ELLIOT, has been appointed to take charge of publicity work as "public relationships" officer of the Southern Railway. He is a son of Mr. R. D. Blumenfeld, editor of the *Daily Express*.

MR. ALFRED F. BELL, editor of the *Portsmouth Times* and *Hampshire Country Times*, has been presented by the literary staff with a suit-case and various reference books, on retiring after 20 years' service with the firm.

MR. JAMES FARQUHAR, a member of the composing-room staff of the *Dundee Advertiser*, has been presented by the proprietors with a gold chain and pendant and a wallet of Treasury notes, on completing 50 years' continuous service.

AT the annual dinner of the staff of the *Whitby Gazette*, Mr. F. W. Horne, on behalf of the directors, presented silver cakestands to Mr. T. H. Tyrewan, machinist, who has had 27 years' service with the firm; Mr. W. J. Hansell, linotype mechanic, 25 years; and Mr. A. Wood, stonehand, 25 years.

THE menu card contained photographs of the recipients, along with those of Mr. E. Hall, foreman, 53 years' service, and Mr. W. G. Barker, 28 years' service, to whom presentations have already been made.

CONGRATULATIONS and good wishes to Mr. A. W. Foster, B A. (secretary of the Papermakers' Association), who reached his 50th birthday on Monday.

VISCOUNT ROTHERMERE, in memory of his former connection with Leeds as proprietor from 1900 to 1923 of the *Leeds Mercury*, has presented to the Municipal Gallery a painting by the Venetian 18th century master, Antonio Canale.

VISCOUNT BURNHAM has been appointed by Queen Alexandra a member of the Council of Queen Victoria's Jubilee Institute for Nurses.

SIR FRANK NEWNES, BT., will preside at the seventh annual festival of the National Advertising Benevolent Society, to be held at the Connaught Rooms on March 13th, and will be supported by the Home Secretary (Sir William Joynson-Hicks), Sir William E. Berry, Sir Charles W. Starmer, Colonel Sir A. Holbrooke, M.P., Sir Harold Bowden, Sir H. E. Morgan, and others.

SIR ROBERT BAIRD, managing director of the *Belfast Telegraph* and allied newspapers, has just celebrated his 70th birthday.

MRS. G. E. BRISCOE EYRE, widow of Mr. G. E. Briscoe Eyre, late chairman of Eyre and Spottiswoode, Ltd. (King's Printers) and Master of the Stationers' Company in 1912–13, has presented through Mr. George Duke, a Freeman of the Stationers' Company, and a holder of the Company's Silver Medal, a book of autographs of the Freemen of the Company who are or have been in the service of the firm.

AFTER evening service at Giggleswick-in-Craven Church, Yorkshire, on a recent Sunday evening, instead of there being a sermon, Mr. Charles Ogden, editor of the *Yorkshire Observer*, spoke on "The Relation of the Daily Newspaper to Religion."

MR. AND MRS. ARTHUR W. GIBBONS, of Maidstone, celebrated their silver wedding last week, when Mr. Gibbons was the recipient of a rosebowl and pipe from the members of the editorial and printing staff of the *South Eastern Gazette*, at which office he which he is head linotype operator.

Trade Union Matters.

TYPOGRAPHICAL ASSOCIATION DELEGATE MEETING.—The triennial delegate meeting of the Typographical Association which, in the ordinary course of events, should have been held last year, but which, principally owing to the depleted finances of the Association, was postponed by a ballot of the members, will be held this year in June, and the Executive Council have accepted an invitation to hold the meeting at Lowestoft. Branches of the Association are now being invited to forward resolutions for the agenda, and these must reach the general offices of the Association at Manchester not later than March 3rd. The delegate meeting is the principal executive meeting of the Association, and business of a highly important character will probably be transacted.

LEEDS TYPOGRAPHICAL SOCIETY. — The secretary of the Leeds Typographical Association, in a review of the local printing trade of last year says the feature was the continued improvement in the industry. "As a matter of fact," he says, "the volume of employment has been greater than in 1923, and has almost reached a point which might reasonably be regarded as normal as compared with the pre-war period." Expenditure on Association unemployment benefit has fallen from £2,461 in 1923 to £1,069 in 1924, and on branch account the figures have fallen from £1,128 in 1923 to £462 in 1924. Sickness payments, however, have been heavier than in 1923, the total being £578 as compared with £389, although part of this is due to higher rates of benefit.

NATIONAL UNION OF JOURNALISTS.—The committee of the N.U.J. at its last meeting made grants of £20 and £30 to members who had been compelled to cease work owing to illness; £10 from the Benevolent Fund to a member in distress; £18 from the War Distress Fund; and a pension of £1 a week from the Widows and Orphans' Fund. The annual delegate meeting of the Union will be held at Easter at Birmingham. After March 15th next the headquarters of the Union will be at 5, Chancery-lane, London.

TENDER.

Parish of Lambeth Board of Guardians.

CONTRACTS FOR PRINTING, BOOKBINDING AND STATIONERY.

THE Guardians of the poor of the Parish of Lambeth desire to receive Tenders for Printing, Bookbinding, and the Supply of Stationery.

Printed forms of Tender, with conditions annexed (which alone will be received, and which will include a full and descriptive statement of particulars, and where possible the estimated quantities of forms, etc., likely to be required) may be obtained, and samples may be seen, at this Office any day after Monday the 23rd February between the hours of 10 a.m. and 4 p.m.

Tenders must be sent by post, to reach me on or before 10 a.m., on Tuesday the 10th March, and will be opened at the meeting of the Guardians on the following day, but will be decided upon at a subsequent meeting.

The Guardians do not bind themselves to accept the lowest or any Tender.

By order,
JAMES L. GOLDSPINK,
Clerk.

Guardians' Board Room and Offices,
Brook Street, Kennington, S.E.11
16th February, 1925.

Thomas de la Rue Scheme.

A scheme for the reorganisation of the capital of Thomas de la Rue and Co. is now announced by the committee of the holders of Convertible Eight per Cent. Mortgage Debenture stock. The issued share and debenture capital at present amounts to £2,037,570. The committee state that about £1,250,000 is at the present time unrepresented by assets, and must be written off as lost. In addition there will be outstanding at March 31st next Deferred Interest Certificates to the amount of £212,630.

It is proposed to deal with this deficiency as follows: (1) By writing 19s. 6d. off each issued £1 share, and reconsolidating the resulting shares of 6d. each into shares of £1 each, this reducing the issued share capital from £640,000 to £16,000; (2) by writing 50 per cent. off the capital value of the Convertible Eight per Cent, Mortgage Debenture stock, and by issuing to the holders one share of £1 for each £2 of stock now held; (3) by cancelling 90 per cent. of the Deferred Interest Certificates outstanding, and issuing to the holders profit-sharing notes for the balance, which will have no capital value, and will be redeemable out of surplus profits in any year after 8 per cent. has been paid on the ordinary shares.

The reorganised capital will be: Ordinary shares issued to Convertible Eight per Cent. Mortgage Debenture stockholders, £590,640; ordinary shares of £1 each issued to old shareholders, £16,000; and First Mortgage Debenture stock, £216,290.

THE Earl of Oxford and Asquith will preside at the sixty-second annual dinner of the Newspaper Press Fund early in May.

THE death of Mr. Joseph Edward Penzer, of Moseley, Birmingham, removes a senior representative of Messrs. James Upton, Ltd., Baskerville Printing Works, Birmingham. Mr. Penzer had spent 60 years in the service of the firm, retiring only in May last.

IN connection with the Plymouth Printers' Social Association a Valentine carnival ball was held at Goodbody's Cafe on Friday. Mr. E. G. Stent, assisted by a committee, was responsible for the arrangements, and Mr. E. F. Wallace was M.C. The ball was a very enjoyable affair, and lighting effects and various novelties were an interesting feature.

SEASIDE FLATS FOR PRINTERS.—A banquet will be held on Saturday, March 21st, at the Hotel Cecil, in aid of the fund which is being raised by the Lloyd Memorial (Caxton) Seaside Home for the erection near the home at Deal of flats for retired London printers. Lord Hambleden will preside. It is hoped that the proceeds, together with special donations, which are asked for, will enable the committee of the home to carry out the scheme to provide healthy homes at moderate rents for members of the printing industry who have retired from active work. A valuable freehold site adjoining the home is available for this purpose.

Postage Stamp Printing.

being no mechanic, never produced a successful machine. It was left to Mr. Napier, the engineer, to perfect his machine into a practical working success after the Government had bought Archer's patent for £4,000. Archer was ill-satisfied with his remuneration, although it has been recorded in "Notes and Queries" that a correspondent could have bought Archer's patent outright in 1848 for 20s.

The subsequent history of stamp perforating is full of complications which seemed to defy mechanics and engineers. Under present conditions for British stamps it requires the use of highly perfected machinery with extremely fine adjustment.

Consider a sheet of postage stamps, 240 set, and note the limited gutters left between the stamps for the perforation. These gutters are .0625 in. in width, and the perforation holes with a diameter of .035 in. have to fall wholly within the gutters. In the comb on a British stamp perforator, as used at Watford and Somerset House, there are about 650 pins, and, working to such small gutters, and on gummed paper highly sensitive to atmospheric conditions, micrometrical adjustments in every direction are necessary, and these are made to thousandths of an inch. There is not only the variation in paper to contend with, but often a slight irregularity or curve in the plate to be counteracted. This condition is more liable to occur in the plates of 240 set solid than was the case with the plates broken into two panels of 120 which have now been superseded to economise paper.

The perforation is best operated across the paper web, at right angles to the way the stamps are printed. The comb is a little more than 21 stamps long and takes thirteen operations across to complete the sheet. In the thirteenth descent of the pins the spurs of the comb run off the sheet margin. The process would seem slow, but as many as seven or eight sheets are in the perforator at a time.

Rotary perforating appears to be out of the question for the exact work required here. It is used in America, but the results obtained there would not satisfy the authorities here. In rotary perforating, first in one direction and then in the cross direction, there must always be a clashing at the points where the perforations cross; the same applies to any single line cutters crossing each other.

Enough has been said, I think, to show how far from a simple typographic printer's job is the manufacture of our own stamps, and, while the business of stamp-printing is no longer sacrosanct, it can only be undertaken by large firms with great resources. In the combination of all the factors of paper, watermark, design, colour, gum and perforation according to specification lies the hope of security from forgery. The maximum of security lies in preserving the uniform identity of the genuine article; if genuine stamps differ one from the other, the good forgery will not be readily detected or easily proved. But, as I have said, we are further protected here by the restriction on the distribution and sale of our postage stamps, which makes it difficult for anyone to dispose of counterfeits of our postal denominations on a profitable scale.

Stamps in Booklets and Coils.

From the earliest times stamps have been issued to the post-offices in sheets—there are a few exceptions. It is only within recent times that new forms of issue have been found useful, and while the sheet-form issue is still predominant, there are indications that the new forms of booklets and coils will to a great extent supplant the sheets.

The demand for the convenient little booklets has increased very rapidly. When introduced in this country in 1904, a charge of ½d. was made for the booklets, and people here seem always to have had a reluctance to paying more than the actual postal face value for special services, even for postcards and envelopes. On the removal of the ½d. charge in 1911, the sale of booklets jumped from 1 to 6 millions; to-day the output is 12 millions, but the demand is greater, and the printers' capacity is equal to the larger demand, but the Post Office is held up by the advertisements; it is not being found easy to fill an increased number of editions with trade advertisements.

The booklet stamps are not printed from the ordinary plates, but from plates with a special lay-out. The plate arrangement here has varied somewhat since booklets were first issued, but the basis of the present system is a plate of 264 set in four strips of 66, 22 down by 3 across; each alternate strip of 66 is inverted, and between the second and third strips is a binding margin; the outside vertical edges provide binding margins also. In the 2s. books with perforated advertisement spaces stamp size, there is a modified form of the 264 set plate. The set of stamp sheets of 264 with interleaves and cover-sheets stacked together and stitched are guillotined through the binding strips and between every six stamps, producing a batch of 44 booklets at a time.

The issue of postage stamps in coil form is the outcome of the development of automatic vending and affixing machines. The printing of stamps in strips has some historic prototypes in philately, one of the premiated suggestions in the Treasury Competition of 1839 being for stamps embossed from cylinders in continuous lengths, but with spaces marked off in shillings' worths, and to be sent to the distributors in coils of one pound's worth. That was the proposal of Mr. Benjamin Cheverton, 86 years ago.

To begin with, in Britain, our coil form stamps were made up from sheet printed stamps, with the margins trimmed off and the sheets joined endwise or sidewise to required lengths. These lengths were then slit up by means of special slitting machines of a pattern similar to those used in America.

The manual labour of pasting the sheets together was not only slow, it was unsatisfactory, for the coils were to deliver stamps rapidly from the delivery slots of complicated affixing or vending machines.

CAPACITY

THE profit earning value of a composing machine depends upon its capacity.

The Intertype operator can have twelve faces at his disposal without leaving his chair.

When it is necessary to change a magazine it can be removed and another one substituted in less than ten seconds.

These are some of the advantages which make the Intertype the most profitable machine of its class, and account for its outstanding success.

We can easily show you how the Intertype can increase YOUR profits.

The slightest unevenness in the alignment of the coil might clog the apparatus from within, and even the double thickness at the joins impeded delivery at the mouthpiece of the machines.

Experiments have been in progress for about fifteen years to print stamps in the web from flat typographical plates. Cylindrical plates and rotary printing were ruled out, and so long as our sheet-form and booklet-form stamps are printed from flat plates it is essential in the interests of uniformity that coil-form stamps should be of identical impression.

The Grover Reel Printing Machine now in use at Watford, and in use experimentally before the War at Somerset House, prints from a flat plate of 180 set on a roll of paper 18 in. wide. A crank motion allows the comparatively long pause in the passage of the web while the impression is being taken. The achievement of the machine is that the successive printings from the flat plate fall so evenly on the web that you cannot detect where two impressions of the plate meet, and endless rolls are printed without the slightest variation in spacing.

It was originally intended that the stamps should have a caramel numbering on the back, but numeration is confined to the margins for checking purposes and for measuring the required lengths for the issue coils.

The machine has a capacity of about 1,600 impressions per hour, or 288,000 stamps—slow compared with the sheet-printing with 4 plates of 240 set running on a Wharfedale, but for coiling purposes the slower printing is compensated for by the rapidity with which the slitting and coiling can be done and the more satisfactory results obtained. Our annual output of coils is but a small percentage of the total issue of stamps, rather under 300,000 coils (in about fourteen styles and varieties) representing about 150 millions of stamps.

The plate arrangement of 180 stamps is in two panels of 90 with a blank central margin. In winding up the coil as printed, a gummed tape is wound in over this central space, and prevents any set-off of the impressions.

The perforating of stamps in continuous rolls has not been easy of attainment to conform to the exacting requirements of our authorities. But, with the perfecting of the reel-printing machine printing from flat plates, the perforating can now be done with the same precision as for sheets. The reel printing machine punctures holes in the outside margins, to coincide with register studs on the perforator. The paper tape wound in with the printed reel is also a factor in unwinding the reel evenly into the perforator. The paper is unwound in festoon fashion to avoid stretching. I am not sure whether it is yet done, but there should be no ultimate difficulty in unwinding several rolls into the perforator at a time.

The slitting and coiling of the perforated roll is done on a machine with stripping knives and slitters, the separate ribbons being drawn off on to eighteen separate spindles. A reeling machine averages 108 coils an hour.

New Stamp-Printing Processes.

To turn now to modern developments in other processes, attempts have been made over a long period to print from intaglio plates on dry paper, to eliminate the variable shrinkage of paper which has to be wetted down for taking the impression, and also to enable intaglio printing to be done on gummed paper. The Dujardin machine was the first of this kind to come into use for stamps. The Hoes built one for the newly-established Government works in Chile in 1914, and, so far as I am aware, it is the only one in use for stamps. In the circumstances of the production of stamps by a new method in a new country, possibly under difficult local conditions, and in view of the difficulty of getting definite information, it would not be advisable to judge the achievements of this machine from the stamps issued by Chile since 1915. There was a flatness about the early work that misled some of the philatelic chroniclers into describing the stamps as lithographed, but there has been a great improvement since then.

The Stickney machine is another matter. When I saw it in Washington in 1913, it was already adopted by the Bureau of Engraving and Printing, but was not yet in commission. It has now been in use for some years in America, and for about four years in Sweden. The Turkish Government is possibly going to instal a similar plant, and has placed a contract for its forthcominig stamps in Sweden to be printed on the Stickney plant in Stockholm.

The machine invented by Mr. Benjamin R. Stickney prints from recess plates bent to cylindrical form on rolls of dry paper. The inking and wiping are done mechanically, and the printed roll passes through electric drying cylinders which dry the ink. The roll passes on to a glass gumming cylinder and then through a steam-heated drying shaft about 20 ft. long. It is carried dry from this shaft to the perforator, and on to the cutting, slitting and coiling apparatus. They can be cut into sheets of 100, but at present the chief use of the machine is in the manufacture of coils. As if all these processes were not enough in one complex machine, they are now pre-cancelling the stamps in rotary fashion. The system of pre-cancelling is little known here, but it consists in supplying large mailing concerns with postage stamps already cancelled to save time and labour in the post office.

A machine performing all these operations rapidly—it is claimed that it performs 23 distinct operations—should have a future. It was claimed that it effected a 65 per cent. saving, or 280,000 dols. on the stamps printed on it during its first year. A few years ago an effort was made to induce the British Government to adopt the Stickney machine for its stamp printing, but without success. And in its present stage it would not produce stamps to our stringent requirements.

To form the cylindrical plate, two flat plates are turned to semi-circles and joined to make a complete circle. On the United States and on the Swedish stamps we find at every seventeenth stamp a heavy line of colour showing where the ink has got into the join; the two plates make a circle of 34 stamps round the cylinder, ten or twenty stamps wide. The die, I understand, has to be engraved very deeply, and very considerable pressure has to be exerted by the cylinder to get the full impression on the dry paper. The stamps show a full millimetre difference in length from the stamps of like denomination printed from flat plates, which may be due in part to this pressure and to stretch caused by the tension on the roll. The impressions are smooth, and lack the full rich colour of the flat printed intaglio stamps. And although a wide gutter is left for the perforations, rather more than twice the width of the British stamp gutter, the perforations rarely fall quite evenly, and are commonly found cutting through the design. Still, perforation has never been a strong point in the American stamps.

Very few stamps have been printed up to the present time by the offset-method, and these chiefly in times of emergency. On the raising of the penny postage rate in the States to 3 cents in 1917, the Bureau was put to a severe strain in producing a sufficiency of 1 cent and 3 cent stamps, and for the first time in the history of the postage stamps of the United States there was a departure from the intaglio method. They followed the same designs as the plate printed stamps, but in each case an enlarged photograph was made and carefully touched up, and by the aid of the Step-and-Repeat machine a glass multi-negative of 400 set was made. The multi-negative served as the master-plate from which the zinc typographic plates were made, from which the inked impressions were taken off by the rubber cylinder and offset on the paper.

As I have mentioned, the work was done in an emergency, and no British printer would care to point to these stamps as even fair examples of what can be done by this important printing process. The German stamps printed in like manner in March, 1920, were likewise an emergency issue, but are much superior to the Americans. So far as the offset part of the process is concerned it is possibly open to the objection that in taking off from plate to rubber blanket there is an additional remove from the original.

Various forms of photogravure have been used in recent years for stamps, and this method appears to be gaining favour with foreign Governments for stamps. Bavaria and Czecho-Slovakia have used it in the past, but the latter only printed one special issue. Belgium gave us what is undoubtedly one of the finest modern stamp designs by photogravure, from multi-negatives by the Step-and-Repeat machinery of Lithotex invention. This was the 1919-20 issue, with portrait of King Albert wearing a steel helmet. This is as near the best intaglio work as anything I have seen in stamp photogravure. The multi-negatives were stepped up in London at Messrs. Eyre and Spottiswoode's, and sent over to the Enschedé's at Haarlem, where the stamps were printed. The Enschedés have just printed a special Dutch series by photogravure.

Messrs. Harrison and Sons have printed the Egyptian stamps for the last two years by photogravure, and they are handsome stamps, with a photographic likeness of the Egyptian King. The newly-equipped stamp factory of the Egyptian Government under the Survey-General is also going to use photogravure, and has installed the Lithotex plant for its plates, and Grover comb perforators. Another country hitherto chiefly devoted to intaglio work is Salvador, which has just been provided with photogravure stamps by Messrs. Waterlow and Sons.

The Step-and-Repeat Machine.

Mention of the Lithotex plant brings me to the important contribution of the Step-and-Repeat machine in all current processes of stamp manufacture. Its uses in lithography and offset are well known to you, and I have referred to its use in photogravure. It is perhaps not so generally known that, with the perfecting of the associated processes, it is going to be as useful in typographical and intaglio work. In the matter of securing perfect alignment across and down the plate of stamps it produced entirely satisfactory results when first introduced here by Messrs. Miller and Motley about fourteen years ago. They made some plates for me in 1912 of an exhibition stamp, designed to demonstrate the modern requirements of our postage stamps, and the same subject was treated by what was then called "the Printex" for surface-printing (240 set) and for recess-plate printing (120 set). The results were very good, but the process is more scientifically exact than it was twelve years ago. The exposures for the multi-negative are automatically time-controlled, and with an improved instantaneous shutter every exposure is exactly the same. Improvements in standardising the sensitising of plates, and electrical etching have all contributed to eliminating the factors which left loopholes for minor variation.

The plate making for our typographical stamps at the Royal Mint is at present a slow and costly business. Our National Health and other insurance stamps have been successfully printed typographically from plates made by the Lithotex process.

It should be mentioned in a general survey of processes of stamp-printing that ordinary process blocks have been used, generally in remote countries. A few years ago, Uruguay gave us a set of bi-coloured stamps, the frames printed from ordinary line blocks and the centres from half-tones. Kishengarh and Soruth, feudatory states of India, have also printed some stamps from half-tone blocks. Since Poland came into her independence and is producing her own stamps she has used the photo-zincographic method, and is probably doing so to this day. The stamps are not to be held up as models in a country where the typographic arts have attained the high level they have reached in Great Britain.

In conclusion, I would refer to the tendency that is so prominent to-day—the ambition of foreign countries and the colonies to print their own stamps instead of having them well and truly printed in this country where you know the art so well. Of recent instances, Ireland is the the only one that has made a really good job of it, but there the work is in the hands of men who had extensive experience in the printing of our British stamps. South Africa's attempts have been much less satisfactory. India is preparing to print out there, and is pretty sure to encounter considerable difficulties. Egypt will soon be printing her own stamps by photogravure, and the Survey-General of Egypt has some experience of stamp-printing for Palestine and the Hejaz.

But, on the whole, I think the countries where native labour has to be relied on will do well to send their stamp and security printing to the Home Country, where it can be done with the greatest efficiency and the safest control.

The World's Printing Trade

NEARLY forty years ago "The British and Colonial Printer and Stationer's" Special Quarterly Export Issues were started, to cover the World's Printing Trade.

These special issues were almost instantaneously successful, and to-day "The British and Colonial Printer and Stationer" stands pre-eminent as the printing trade journal, carrying the message of British Print throughout the world.

Without exceeding the bounds of modesty, we can legitimately claim that this journal has made the export departments of certain firms, whilst it has increased the overseas business of its advertisers generally.

It is not for us to presume to instruct supply houses their method of doing business—we can only give you the experience of our advertisers:—

> "It will no doubt interest you to learn that during the past few years we made considerable additions to, and have extended our Export Dept. We thank you for the assistance that your Journal has contributed towards this export business.—C. B., Ltd,

"The British and Colonial Printer and Stationer" specially circulates in the following countries:—

Australasia.	East Indies.	Canada.
India.	West Indies.	United States.
South Africa.	China.	South America.
	Japan.	

The next Special Export Issue will be published on March 19th, 1925.

One of our representatives will be pleased to call upon you at your office, in your time and at your convenience. He is entirely at your disposal, and a conversation can do no harm.

Write us to-day!

Some Pointers to Increased Profits.

By B. N. FRYER.

Extensive American competition with this country in the realms of steel, films and motor cars would seem to indicate that an economic panacea does not necessarily lie in lowering wages and lengthening hours—a remedy much advocated by certain industrialists obsessed by German inroads on British trade. There are lines of action other than lowering standards of living and curtailing of purchasing power. Reducing wages and increasing hours has but one merit—it requires little executive ability to suggest and put into operation. It is the line of least resistance mentally. It savours of panic action, and it should be a last resort on account of the damage it does the body politic.

All this by way of introduction, and to point to a converse idea, suggestive of opportunities to be profitably exploited. In the printing industry wages are only about one-third of the cost of the finished job; therefore there should be a big field elsewhere wherein to cut expenses. Especially is there such a field in the facilitating of co-operation among the staff in shop and office. This is a phase to which in the United Statee considerable thought is given, and which is to be seen in operation. The human element is coming into its own again in American industry, and nowhere more so than in the Anglo-Saxon trade of printing, with its Craftsmen Clubs and Graphic Arts buildings, whereat men exchange views and wherein firms work side by side, as outstanding features. At the Craftsmen Clubs, which are from a London model, foremen, overseers and executives discuss problems and thresh out difficulties. In some of the latest clubs employees do the same in their sphere. The Graphic Arts buildings are specially built for printers, several firms being under one roof. Most big cities have at least one such hive, smelling of ink and humming with composing machines and presses.

Co-operation in the Printery.

Co-operation must necessarily emanate from the management, and keep in circulation as the spirit of the house. Successful businesses usually centre around a personality. This is exceptionally true in the half-trade, half-professional vocation of printing, with its peculiar call for diversified qualifications. A long roll of printeries that have arisen and fallen with their founders bears witness to this. It follows that labour-saving equipment does not necessarily bring results of any magnitude unless labour-saving as a force permeates the staff. For instance, it is an unusual calibre of machine compositor who can keep on trying for speed under a stream of bad copy and haphazard conditions. On the other hand, the man who does not respond to executive foresight is not worth keeping. Many a man adopts "ca'canny" tactics under the deadweight of continued handicaps of faulty management, by which he is compelled to go into clairvoyant trances after hidden meanings in copy, or to hunt for sorts or for furniture, or to doctor ink, or to toil at avoidable make-ready on bad formes.

Where routine goes with a swing, however, it is inevitable that men will fall into step with it, and if this spirit is spread from department to department and an active co-operation generated between the front office and the composing room, and extended through the machine room, bindery, and delivery rooms, right to the point where a customer's parcel bears a distinctive imprint even in the way the knot is tied in its string—then there will be found a printing office getting in much work because turning out much work; for work attracts work. And overhead is thereby reduced.

Production naturally returns dividends to all engaged in it. It is stimulated by the thought put into it when that thought engenders methodical teamwork.

Although the distinctions and rivalries between departments play a part at times in disrupting co-operative effort, most of them inside the shop can be anticipated and forestalled, and will, in a genial atmosphere, dissipate themselves. A considerable gap often overlooked in its effects, however, is that between clerical staffs and workmen. Misapprehension of the relation of one to the other is responsible for many a hitch in routine, a most vital one cropping out in connection with costing systems.

The Docket Problem.

Incorrectly made out dockets spoil numberless cost sheets. Workers frequently do not realise what the sheets and cards are for, or what the enumerations signify—perfectly natural in any one unacquainted with bookkeeping and who is in the habit of carrying job details in his head. A prevalent assumption, too, is that bookkeeping does not matter, anyhow!

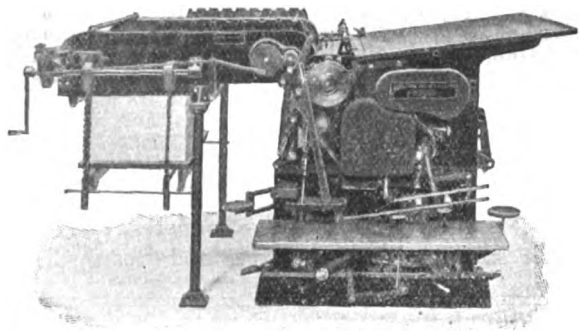
Time dockets are often received with resentment in the shop, being looked upon as data finders for speed tabulations as well as unnecessary, new-fangled nuisances. This attitude leads to missing links in the system. It is difficult to get the ordinary workman to grasp the necessity for paper-work; some small proprietors, even, are not free from this. The writer knows of a big co-operative concern where the attitude of the department workpeople towards the clerical staff—because this staff by drawing salaries cuts into dividends—cankers a really fine organisation.

Therefore it should be to the interest of firms to have qualified men explain dockets and their relation to the costing system as a whole and back their statements with disinterested evidence. An organised course of lessons to workmen in which the intent of the system is stressed would tend to eliminate profit upsetting practices, such as cribbing time off quickly finished jobs to put on others that have taken longer than estimated—a common dodge, as often as not done from a belief in fallacies regarding individual speed. It would help to track down shortages of sorts, ink or paper; minimise tying up of material or equipment; and facilitate dovetailing of departments by enjoining co-operation. For anything that by its presence or its absence hinders the progress of work should be noted on dockets, in order to avoid repetition of delays.

Education Essential.

But the main bugaboo to get out of the workers' heads is that time dockets are designed to keep check on their personal efficiency; for it is this very active suspicion that puts a spike in costing systems, and it takes repeated ocular demonstrations, even to the point of details of the whole system, to kill this suspicion and make it stay dead.

The broad view of those who understand costing principles is not to be expected in the shop. Were a workman conversant with details so far-reaching, he would be promoted as a matter of course, and of policy. This procedure of immediately promoting the really efficient to the ever-waiting position higher up has the natural corollary of always leaving the less efficient in less responsible posts. Direction by those who do comprehend should therefore be assumed and carried out, so that instructions will bear fruit in a general house policy. Some firms in the United States are very plain in putting cost facts before their men, even taking them into confidence as far as publishing figures (generally relating to loss by waste of time) on bulletin boards. For it has been found that partial, unrelated information is at times responsible, even with intelligent, high-grade workmen, for gross misconceptions, misconceptions that, when allowed abroad unchecked, militate against the best interests of the trade.



The foregoing by no means covers the whole two-thirds area wherein the enterprising printer may prospect for good returns, but it gives pointers to some little-worked veins for profits of sound colour.

L&M

OFFSET LITHO ROTARY

WITH PILE DELIVERY.

FEED SIDE OF THE L&M OFFSET LITHO ROTARY WITH PILE DELIVERY.

This is a two-revolution press—a very desirable feature in a machine for colour printing in dead register. The printed sheets are delivered face up on the pile clear of the machine at a convenient height for examination. The plate cylinder is of large diameter, which facilitates perfect inking, damping, and manipulation of the plate. The damping mechanism is placed below the plate cylinder, so that splashing of water does not affect any other part of the machine. The ink distribution is highly efficient. A combination mechanism automatically trips the impression cylinder, inking rollers, ink-ductor, and water-ductor rollers. The machine attendant can fully control the press without leaving his seat.

It is built with Pile Delivery, but can be supplied with an ordinary delivery board if desired.

This Offset Press is built in three sizes:—

Machine No.	Size of Sheet.	Size of Design.
	in. in.	in. in.
No 1	37½ x 52	37 x 52
No. 2	33½ x 45½	33 x 45½
No. 4	25 x 37	24½ x 37

LINOTYPE & MACHINERY LTD.

9 KINGSWAY, LONDON, W.C.2

The State of Trade.

Book printers are well supplied with orders, and last year a record in the number of books produced was reached—writes Mr. A. E. Goodwin (secretary, Federation of Master Printers) in *British Industries*, the organ of the Federation of British Industries. New methods of mass production with wonderful automatic machinery have enabled some publishers to place a sixpenny edition of popular works on the market. These cheap editions foster the book-reading habit and the demand for higher-priced volumes increases. Experiments are being continued with new methods of reprinting by photographic and lithographic processes, which, if successful, will cheapen production.

In the section of the industry concerned with printing for advertisers, keen interest is being taken in the efforts to restore the penny post, as this would certainly lead to the more general use of booklets and catalogues. The Postmaster-General's reception of the deputation from the Joint Industrial Council was encouraging, and, though his statement was guarded, he did convey the impression that some step might be taken in the direction of a reduction in postal rates. The remark he made, that the Post Office has to provide for capital expenditure in connection with telephone expansions, will not appeal to business men as a sound reason for the continuance of higher postal rates.

In the poster branch of the industry there is good business. Advertisers are using posters in greater quantities and this is due, no doubt, to the good quality of the British product. The competition from America and the Continent in this branch of the trade is becoming keener, but so long as the high standard in design and execution is maintained, British advertisers are not likely to go abroad for their requirements.

"THE NATSOPA SPIRIT."—As an instance of comradeship amongst members of the National Society of Operative Printers and Assistants, a case that has occurred in the *Daily Mirror* chapel is thus described in the *Natsopa Journal*: "One of the members of that chapel, whom we need not name, due mainly to his war troubles and worries, is suffering from a mental derangement and was taken away by the authorities and placed in a Poor Law Lunatic Asylum. Upon this becoming known to the chapel, they resolved that they would remove the pauper stigma from their colleague and have him taken to a private home. They appointed a small committee to act in the matter, and this committee found that the difficulties in their way were tremendous. They also found they had considerably less than 48 hours to make the change before their colleague was sent away into the country to one of the Poor Law Institutions. The two members appointed by the chapel were two of a kind not to be deterred by difficulties. It is to their credit to say that before the time limit had expired they had made the arrangements for their colleague to be removed to a first-class private institution within easy access for visits by his relatives and friends. The chapel have undertaken to bear all the necessary costs of removal and to bear the cost of the maintenance of their colleague in the institution for such period as it may be necessary for him to stay."

Paper, Print and Efficiency.

The Combined Pulling Power Demonstrated at Business Efficiency Exhibition.

The important part which paper plays in business efficiency was clearly demonstrated at the Business Efficiency Exhibition which closed at the Central Hall, Westminster, on Feb. 14th. Not only so, but almost every action in proceeding to and returning from the Exhibition, was accompanied by a use of paper and print in one form or another. To begin with, one would probably light a cigarette rolled in paper with a pasteboard match out of a cardboard folder. Then in travelling by train or bus a paper or pasteboard ticket is returned for the price of the fare, while on entering the Exhibition the visitor probably tenders the price of admission in the form of paper money and receives a paper ticket of admission in exchange, unless of course, he is furnished with a cardboard season ticket.

At the Exhibition itself the catalogue is quite a voluminous compendium of paper and print. On entering the hall the fact that struck one about the stands was the amount of printed or ruled paper and cardboard in evidence, for even if these commodities are not used in the actual performance of every efficiency system, they are at least used for purposes of publicity or in subsequent operations. Finally, after collecting a host of literature and examples of the systems demonstrated, these may be conveniently placed inside a large paper bag upon which the printer has emblazened an effective advertisement. The promoters of the Exhibition themselves, who are very effective publicity agents, employed paper and print very extensively in bringing the engagement to the notice of the interested persons, duplicating paper being a conspicuous medium.

The extent to which paper is identified with all forms of office systems is infinite. Even where the apparatus is entirely of metal, as in calculating and adding machines, the results to be of subsequent use have to be conveyed to paper. In other directions the systems are mainly built up of paper and cardboard. One firm alone, Messrs. Kenrick and Jefferson, Ltd., use something like 300 tons of paper per month, which is made up into all forms of office stationery. In many of their schemes colour plays a very important part and the matching of the paper has to be very exact.

Loose leaf ledgers, of course, are a prominent feature of business efficiency, and ingenious devices have been developed to meet the needs of the ledger clerk and at the same time to economise time. One of these has been introduced by Tollit and Harvey, Ltd., who have invented a book-heading indicator, which can be adapted to each page in the book, thus obviating any repetition of writing the various headings. These will fit any ledger and are adjustable to any rulings.

The Lamson Paragon Supply Co., Ltd., Kalamazoo Ltd., and various other firms exhibited loose-leaf ledgers in great variety, the paper for which has to be of the best quality.

Indexing and filing systems call for the use of cards to an illimitable extent, but a number of new methods are being brought forward. In all of them, however, the basis is cardboard. Unfortunately for the British manufacturer one heard at the Exhibition a repetition of the statement that for particular purposes foreign cards were the only suitable material.

Typewriters and duplicating machines were very much in evidence at the Central Hall, and here again the raw material upon which they work is paper, as it is also, of course, of the miniature printing devices and office folding machines which were on view. Then the addressing appliances are fed with envelopes or wrappers. Furthermore, paper is natural food for the cheque writers and protectors, the facsimile letter-printing and letter-copying machines, and the postal franking device. Among the few things in which it was not directly employed were dictating machines, telephones and efficiency chairs, but in each instance the messages passing would in most cases be conveyed to paper.

Indeed, as already stated, paper and cardboard are the foundation of most of the business efficiency systems; and where steel and wood are used for office furniture, this furniture for the most part is designed to house papers or cards.

Fibre Packing Cases.

Their Place as Sales Factor.

For many years progressive firms have appreciated the important part the package plays in the sale of goods. In the marketing of a new product the design and production of the package are recognised as an integral part of the selling plan. But this refers only to the actual container that is handed to the purchaser; a still further development, which has not yet received the attention it deserves, is the application of the same principle to the outer container or packing case. With all but a few firms, in the recent past, and with many at the present time, the outer package that carries the goods to the shopkeeper receives scant attention or none at all. It is often left solely to the buying department to exercise its choice, and the decision is usually made on grounds of cost. Consequently cheap second-hand cases, home-made packing cases of doubtful security and undoubted ugliness, odd sized boxes and unwieldy returnable cases, which cost much more in upkeep and freight than their actual value, are still used in large quantities. These expedients are ultimately far from economical, inconvenient to the recipient and a temptation to pilferers.

Fibreboard.

The advent of what are generally termed fibreboard packing cases has already changed this to some extent, and millions of these cases have been used annually for several years, but they have not yet been fully appreciated by business firms generally. Their chief interest to the sales and advertising specialist lies in what might be termed their *advertising value*. The material of which they are made is, in the best type of case, a smooth-surfaced product resembling wood and susceptible of being attractively printed. A case of this kind is likely to be seen, not once, but many times, in the course of transit from factory to store, and has therefore a distinct advertising value. From the selling standpoint, too, it carries the continuity of a firm's selling policy into the last detail. The psychological effect of this on the public mind is by no means small. It implies a measure of attention to detail, a suggestion of thoroughness and care which powerfully back up the advertising. The advertising standard may be high, the goods and the container of the best quality—consistency itself demands that if possible the goods should travel in a packing case worthy of the rest.

Nor is the attitude of the retailer to be despised. "Retailer acceptance" may not be considered so important as "Consumer acceptance," but it is by a no means negligible factor, and the sales and advertising departments have to keep the interests of the retailer well before them. A case that is clean, convenient and attractive, rather than clumsy and awkward to handle, is certain to appeal favourably. An attractive and well-printed case which is really an advertisement for the goods it contains instead of being an eyesore in his shop, is an asset, and where the old-fashioned case would be unpacked as quickly as possible and consigned to the lumber room, will probably remain on view in the retailer's shop until the goods are required for sale.

The Advertising Pull.

The selling and advertising departments should therefore not overlook the importance of the packing case in relation to sales, nor its possibilities as a further link in the general scheme of advertising. Viewed from this standpoint no form of outer package has yet been evolved which is more serviceable, more attractive, or presents better possibilities for pleasing and striking printing effects than the solid fibreboard type of packing case. These cases are not to be confused with the cardboard box. They are made to carry efficiently weights up to a hundredweight in a wide class of commodities, while the fact that they have been admitted into the general railway classification for conveyance of goods at railway company's risk is proof of their efficiency.

The manufacture and printing of these cases calls for special equipment, but there are firms in this country with extensive modern plant devoted to this line, who can not only turn out many millions of cases a year, but can print the heavy board in several colours as well and as effectively as a good printer can produce an attractive folder.—*British Industries.*

CRAIG'S BLOTTINGS.—Enclosed in a stout cardboard case, Messrs. Robert Craig and Sons, Ltd., Caldercruix, Scotland, have issued four sets of samples of their well-known blottings—velvet, superfine, Craigson and Nestor. A specialty is made of this class of paper and every sheet is watermarked. Each set shows several shades, the superfine being made in no fewer than fourteen distinct tints. All are produced in a variety of substances and sizes other than those stocked can be made to order. Craig's blottings have a reputation for quality and these new samples establish this fact still more firmly with the collection there is issued a brochure, entitled "The Art of Poetic Diction and Craig's Blottings—the Art of Selection." It gives a graphic description of the process of blotting paper manufacture, indicating at once the skill and care which are required to produce the correct article, even though Robt. Craig and Sons have t ree-quarters of a century's practical experience behind them. Illustrations of various departments of the mill further impress the lesson which the brochure teaches so well.

NATURE is generous, but we must exert ourselves or have someone work for us, or perish.

A Talk About Printing Types.

Mr. John Geddes Addresses East London Printers.

An exceptionally good attendance of members was attracted to the February meeting of the Association of Master Printers of East and North-East London, held at Stratford on Wednesday of last week, when the principal feature was an address by Mr. John Geddes (of Messrs. H. W. Caslon and Co., Ltd), on the constitution and manufacture of printing types.

After the usual sociable half hour around the tea table, Mr. G. F. Tomkin, the president, took the chair, and several matters of business were first dealt with.

Members' attention was drawn to the new Apprenticeship Scheme as approved by the Joint Industrial Council; also to the banquet to be held on Saturday, March 21st, at the Hotel Cecil, in aid of the fund that is being raised by the Lloyd Memorial (Caxton) Seaside Home, for the erection near the Home at Deal of flats for retired London printers.

A letter was read from the L.M.P.A. secretary intimating that the Costing Committee had agreed to supply copies of the four principal forms used in the Costing System to members willing to try them. The president urged that any members who had not tested the Costing System should obtain the forms, as these would serve to open their eyes to the meaning of Costing.

Exhibition of Printing.

Two firms were elected to membership of the Association, and Mr. J. Johnson (L.M.P.A. organiser) reported that, in connection with the forthcoming exhibition of specimens of printing, he had already obtained promises of participation from representative firms. Much interest was aroused in items which were brought to the meeting by two members, and which will probably find a place in the Exhibition, viz., copies of the *Ford Times* (new series), delightfully produced by the Mercury Press, Ltd., and a magazine printed in Siamese and English by Mr. Burns, who also brought other examples of foreign printing.

The chairman explained that the March meeting of the Association is to be devoted to the exhibition of specimens of members' work, a selection of which is to be entered for the London Inter-District Association Competition.

The hon. secretary, Mr. T. D. Hawkins, urged that a big effort be made in connection with this exhibition, and he put forward a suggestion, which met with general approval, that the local Press be invited to attend.

As a selection committee, the following members were elected: Mr. J. W. Jackson, Mr. G. F. Tomkin, Mr. H. W. Upton and Mr. Harold Curwen. It was stated that this committee would be assisted by Mr. R. B. Simnett, president of the South-West Association.

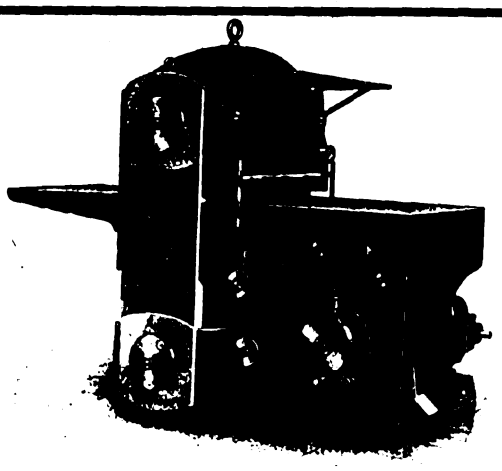
Other business included the reception of a report from the president with regard to matters of interest that had engaged the attention of the L.M.P.A. Council.

The Metals Used in Types.

Introduced by the president, Mr. Geddes proceeded to deliver his address. He remarked that there was still a great deal of printing done by typefounders' types, and, whatever the printer might think of the type produced by the typesetting machines, the fact remained that typefounders' type was a very different thing. Mr. Geddes mentioned the interesting fact that in America a number of firms had started last year to use hand-set type throughout their establishments. This was due to the special class of product aimed at, design being a predominant factor in accordance with the demands of advertisers.

The speaker went on to deal in detail with the metals employed in type manufacture, and he gave a great deal of information as to the characteristics of the various metals, their melting points and so on, indicating their utility in respect of printing type and stressing particularly the importance of the use of only the purest qualities of the best virgin metals. Particulars were given of the ingredients of founders' type, also of the ingredients of metals used for the different composing machines, the superior qualities of the former metals being pointed out.

Next came an outline of the various processes employed in the manufacture of founders' type. Mr. Geddes explained the old processes of making the punches matrices, etc., by hand—which he termed the "grammar" of the subject—and he went on to give some account of present-day methods of doing this work by elaborate machinery, adding also some remarks upon typecasting machines.



The Design of Type.

The speaker concluded by dealing briefly with the subject of type design. He laid stress upon the extreme accuracy required in design and manufacture if the eye is not to be struck by slight variations or irregularities. In this connection he pointed out that the type designer has to make allowance for the illusions to which the eye is subject, these illusions making it impossible for him to adhere to mathematical accuracy in respect of the relative sizes of characters and of individual strokes, the eye having tricks of magnifying or reducing the actual values presented to it. The speaker combated the idea that a face of type can be satisfactorily enlarged or reduced, as by photography, in order to provide a series of sizes; he maintained that, whilst this might be satisfactory for slight variations of size, it was impracticable in the case of larger variations.

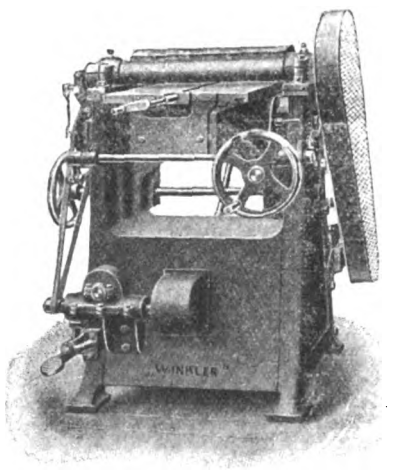
The address was followed with close attention throughout, and special interest was afterwards evinced in various exhibits which Mr. Geddes had brought for members' inspection. Notable amongst these was a punch which was actually cut by the first William Caslon, and there were also matrices and a mould as used in the old hand processes. Modern machine-cut punches were also shown. Mr. Geddes has brought, too, a fine selection of printed specimens—booklets, posters, small jobbing items, etc.—to illustrate typographical effects.

On the proposition of the president, the hearty thanks of the meeting were given to Mr. Geddes for providing an interesting and instructive evening.

PAPER mills in France are suffering from a scarcity of labour. The prices of paper have varied little during 1924, when business was very flat, with some transitory signs of animation. Raw materials, especially wood pulp, are weakening a little.

"Winkler"

Automatic Moulding and Drying Press.



For Fine Art and Newspaper Moulds, Dry and/or Wet Flong—Hot or Cold—with Electric or Steam Heating.

Equals in capacity THREE Pneumatic Presses.
The Matrix is moulded and dried in one operation, the drying taking place under reduced pressure (patent).
The Moisture is extracted by a suction pump.
Automatic Temperature Control and Time Switch.

¶ Produces, in conjunction with Light's "Photo-Tone" Fine Art Flong, Half-Tone Matrices of finest screen so accurate that Stereos cast therefrom are facsimile to originals.

¶ Perfectly even pressure throughout the surface of the platen is absolutely guaranteed, in contra-distinction to all stereo presses operated pneumatically, hydraulically, or by hand power, which have centrally actuated platens inevitably more or less deficient in equality of pressure.

¶ Saves Type, Time, Labour, Power and Fuel.

"Winkler"

Flat Plate Milling Machine.

Mills plates from type-height to pica-height, guaranteed true to ½ thou. of an inch throughout. It combines the functions of two different machines—the Roughing Machine and the Shaving Machine—because it mills the plate in **one** operation down to the desired height.

¶ Insure top-notch printing results by building your plant on a foundation of top-notch Stereotyping Units—the "**Winkler**" Outfit.

¶ The basis of perfect pictorial stereo production is blocks uniform in height, perfect in depth, even in printing surface, and hard in wear.

¶ Progressive printers have adopted the ideal method of mounting their plates exclusively on soft metal bases which have been planed true to a fraction of a thou. on a "**Winkler,**" thereby **saving about 50% or more on "make-ready" on the printing press.**

Particulars can be obtained from, and a demonstration arranged by the Sole Agents:

Trade Notes.

Thomas de la Rue and Co.—A circular issued by the board states that a holder of convertible 8 per cent. mort. deb. stock served notice on the company that he intended to challenge the validity of the resolutions proposed to be passed at the meetings called for February 24th. Acting under the advice of counsel, the directors decided to cancel the meetings in question. Notices of fresh meetings are being sent to shareholders. The circular adds that the objection taken is merely a technical one, and does not in any way affect the ultimate issue.

Re National Advertising Service (Proprietors, Nasco, Ltd.), in voluntary liquidation, the liquidator has declared a third and final dividend of ½d. in the £ and states that he is now closing the liquidation.

Coombelands, Addlestone, a country residence and estate of 180 acres, has been purchased for the erection of a big printing factory and over 400 houses for employees, the purchaser being Mr. Percival Jones, of Birmingham, head of the firm of Percival Jones, Ltd.

The *Cornish Guardian* and *Newquay Express* newspapers, whose offices are the best equipped in the county, have just installed a Cossar flat bed web printing press, thus greatly enhancing their printing resources. The typesetting equipment includes three linotypes and a recently installed intertype, whilst another linotype is on order.

Employers and employees in the process engraving industry are just completing a new agreement stabilising wages for another two years.

The annual dinner of the London Master Printers' Association has been arranged for Monday, April 27th.

The South-West London Master Printers' Association has arranged to hold a whist drive and concert on March 3rd, at the Restaurant, Messrs. Arding and Hobbs, Clapham Junction, S.W.11, commencing with a reception at 6.45 p.m.

The sixth and last of the lectures arranged by the Printing Industry and Stationers' Company Technical Board will be given at Stationers' Hall, on March 13th at 6.30 p.m., when Mr. Henry Hill will speak on "The Quill Pen," Mr. W. B. Mitchell on "The Steel Pen," and Mr. L. G. Sloan on "The Fountain Pen."

Members of the various staffs of the *Western Mail*, Ltd., to the number of about 200 held another successful dance at the Palais de Dance, Newport-road, Cardiff, on Thursday.

Mr. Alfred Holdswoth, of Dewsbury-road, Leeds, late foreman of the first and second section of the *Yorkshire Evening News*, died on Thursday in last week.

The late Mr. Gerald Stanley Philip, of Salcombe, Devon, and of Messrs. George Philip and Sons, publishers, London, left £52,346 (net personalty, £48,256).

The late Mr. Edgar Preston (56), of Scarborough and Huddersfield, late of Messrs. Preston Brothers and Co., manufacturing stationers, left £7,870 (net personalty £7,184).

The late Mr. Thomas Fenby Aitchison Chadwell Heath, retired publishers' agent, left £92,795

The late Mr. William Walton, of Ashton-under-Lyne, retired paper merchant (net personalty £18,052), left £27,848.

One case of lead poisoning was reported from the printing trade during January, and there were two fatal accidents in the same month in the paper, printing, etc., group of trades.

Wembley is to be advertised by the world's biggest poster—40 ft. long and 10 ft. high.

Papermakers' Association and Safeguarding.—An application to be included within the Government's Safeguarding scheme has been made by the Papermakers' Association on behalf of the wrapping mills. A committee is preparing a case for presentation to the Board of Trade, which is the first step to be taken.

We have an inquiry (F.B.I.) for the makers of "Ceresin" paper, used in connection with caps for bottles. Also for "Cymene," a by-product of wood pulp manufacture.

Personal.

Mr. Robert Sheppard, a director of Messrs. Tillotsons, of Bolton, printer and newspaper proprietors, has been presented by the proprietors with a handsome motor car on his completing 40 years' service with the firm.

Mr. J. R. Riddell, principal of the London School of Printing, will give an address at the general conference of the Technical Section of the Papermakers' Association, to be held in London on March 18th, taking as his subject "Paper as the Printer Sees It."

Mr. H J. Wheeler, the "practical manager" of the *South Wales News* and associated newspapers, has this month celebrated his 79th birthday. The congratulations of the "companionship" were conveyed by Mr. H. W. Robinson, father of the chapel.

Mr. Arthur Porritt has been appointed editor of the *Christian World*, in succession to the late Mr. Herbert Clarke.

Mr. Ben Bennison, of the *Daily Telegraph*, was the guest of the evening on Saturday at the annual dinner of the Manchester Press Club, when the chair was taken by the club's new president, Mr. H. P. Renshaw.

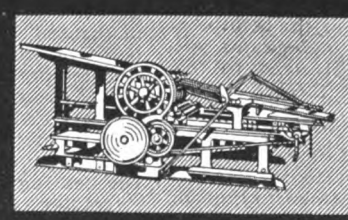
Miss Rita Shell (Mrs. Stewart), editor of the *Lady* for 30 years, has retired.

Mr. W. Watkin Davies, barrister-at-law, of Barmouth, has been appointed editor of the *Welsh Outlook*, the monthly magazine published from Newtown.

Mr. H. W. T. Garnett, of Messrs. P. Garnett and Sons, papermakers, Otley, has left on an Indian tour, and expects to be away for about two months.

Mr. D. McLaren (Blades, East and Blades, Ltd.) won the 8st. 6lb. boxing championship of the London Business Houses Amateur Sports Association.

Mr. Peter Cameron is acting as one of the auditors of the Stationers' and Paper Manufacturers' Provident Society in place of the late Mr. Henry Godfrey.



Mr. Fishenden on Photogravure.

The next meeting of the London Central Districts Master Printers' Association promises to be of very special interest, as on this occasion Mr. R. B. Fishenden, M.Sc.Tech. (London manager, Stephenson, Blake and Co., Ltd.), is to lecture on "Photogravure from the Printer's Standpoint: Methods and Machines." Mr. Fishenden, it will be remembered, was until lately director of the Printing Department of the College of Technology, Manchester, and is a recognised authority on the subject of photogravure, of which process the first connected account of technical details published in this country came from his pen. The lecture is to be illustrated by lantern slides, and there will also be an exhibition consisting of items contributed by leading houses, including technical exhibits, such as cylinders, positives, negatives, etc., as well as photogravure specimens in both monochrome and colour. The lecture will be full of practical, technical information about this very important process, and is sure to provide a most interesting and profitable evening for printers, large and small.

The lecture will take place at Stationers' Hall on Wednesday, March 4th, the exhibition to be opened at 5 p.m., the lecture commencing at 6.30.

Printing Trades Alliance.

Annual Dinner.

Mr. G. F. Tomkin presided on Saturday evening last at the annual dinner of the Printing Trades Alliance, held at Andertons Hotel, Fleet-street. There were about 150 ladies and gentlemen present and Mr. W. W. Cant, the secretary of the Alliance, is to be congratulated upon the excellent arrangements made for the enjoyment of all present. Mr. Philip Guedalla was the guest of the evening.

Mr. H. C. Houghton proposing the toast of "The Printing Trades Alliance" said that the P.T.A. stood for all that was best in trades unionism. The founders were to be congratulated upon their choice of a name. Surely an alliance of Capital and Labour, of employers and employed—both of which had representatives in the Alliance—was the best form of trades unionism. The employer of to-day realised that the better paid and therefore the more contented his employees were, the more assistance they would be. Surely a round table conference was the most sensible way of dealing with industrial disputes. It was a deplorable fact that in the twentieth century we had to resort to the barbarous methods of strikes and lock outs. These methods injured those who used them equally with those they were used against, and they were rarely effective. He was sorry to read the other day that a Labour leader, speaking on this subject, said that the Labour Party were not going to abandon the right to strike as it was their only weapon of defence. They in the P.T.A. had a weapon forged of mutual respect and esteem, tempered with a desire to live and let live, and with it they could not fail to bring their disputes to a friendly and satisfactory issue. He coupled with that toast the name of Mr. W. W. Cant. (Applause.)

The Need for Confidence.

Mr. Cant, who mentioned that he had been associated with the P.T.A. since its inception, said it was gratifying to learn that many Labour leaders were thinking in the same way as themselves and were trying to teach their followers that there were two sides to a question. If there was to be a decision of any permanent value there had to be confidence on both sides. In the P.T.A. they had confidence between employer and employed, not only at the conference table, but day in and day out, in the workshops. They had it also between the officials and the members. It was this personal effort to understand one another that would eventually lead to the real trades unionism of which the P.T.A. was the pioneer. (Applause.)

Mr. C. E. Allen, proposing "The Visitors," said that it was very pleasant to see the ladies present encouraging them by their presence. They were not out to smash trades unionism. They were as good trades unionists as those who believed in "direct action." They had everything that other trades unions had except that they would not withdraw labour and the employers would not lock out their employees. The speaker contended that the trades union movement did not represent the majority of the workpeople. They had amongst them that evening a gentleman who was interested in the progressive movement and who had recently advocated a council of industry. They were making great progress and they wanted to make more. They wanted no one to join the P.T.A. until fully converted to P.T.A. principles, but they wanted the converted to come along and work strenuously for the P.T.A. (Applause.)

League of Nations Atmosphere.

Responding, Mr. Guedalla said he was not prepared to be treated as a stranger to the printing industry, as he was one of the people who supplied the "raw material." They who supplied that "raw material" were not highly organised, so that he was unable to say what would happen if they decided to stop the flow of "raw material." Mr. Allen had been good enough to refer to some of his writings and he was grateful to him for that kind reference. It was a very great pleasure for him to be brought into touch with their movement. He had learnt a great deal about the P.T.A. and meant to learn more. They were the pioneers, the people who saw the right course and followed it. The question that mattered in England to-day was the organisation of industry. The time had gone by when the workers were merely "hands." They now possessed the advantage of education and had the right to the best possible life. They had got to introduce the League of Nations atmosphere into industry and get peace in their own country. That was what the P.T.A. was doing. They had got to get everybody to trust everybody else. The best way to do that was to have a council of industry for each trade, where both sides could meet and discuss the problems of that industry. In this way would they get a proper system of government of industry. They wanted a place where national industrial questions could be discussed by people who knew something about the industry concerned. They could then go to the House of Commons and get them to do the right thing. In that way they would have a real system of government of industry. (Applause.)

Mr. H. Basil Cahusac, in proposing "The Open Houses," gave the company a short history of the formation of the P.T.A.

Mr. Sidders briefly responded.

Mr. W. Kimber proposed "The Chairman."

Mr. Tomkin, in responding, said that it was the first occasion upon which he had been able to be present at one of these gatherings, but he had realised that evening as never before, the soundness of the principles of the Alliance. It seemed to him a triumph of the Alliance that they could have a gathering of masters and men enjoying an evening together. They worked in similar harmony throughout the year. (Applause.)

An enjoyable entertainment was provided by the Misses Alvena Woodruff and Emilie F. Gilpin, and Messrs. Stanley C. Hill and Clement Heywood.

A Talk About Paper.

L.S.C. Jobbing Guild Meeting.

The L.S.C. Jobbing Guild performs a useful function in spreading education among its members concerning their work. It was a happy departure on Wednesday last week to give attention to paper, a material with which printers are so intimately associated. Mr. H. B. Naylor, the enthusiastic secretary of the Guild, presided over the meeting, which was well attended, and Mr. J. Fuller, vice-principal of the London School of Printing, gave the address, which he described as a "Talk About Paper."

Mr. Fuller had taken a great deal of trouble in preparing quite an extensive exhibition of the materials which go to the manufacture of paper, of illustrations bearing on the process, of printed examples showing the characteristics of various papers and samples of the finished product.

The speaker described the fibres which are the basis of paper—rag, esparto, wood, etc., and he outlined the preparatory treatment, dwelling specially upon the importance of the beating operation which determines the character of the paper to be made. The actual formation and drying of the web on the paper machine were then traced with the aid of a print, showing part of a Fourdrinier machine. Methods of sizing, colouring, loading and finishing were also explained. Mr. Fuller indicated the different classes of paper, giving particular attention to the uses of art paper. With regard to imitation art, the value of double-tone ink was mentioned.

The lecturer warned printers of the difficulties which arise through the colour of paper not being of the same shade on both sides of the sheet, and passed on to dwell upon the importance of opacity, which is a feature of Bible and India papers.

A word was advanced for standardisation of paper sizes and reamage, and in giving advice as to how to distinguish between genuine and imitation greaseproof, Mr. Fuller showed how spirit of turpentine passed through the imitation sheet and not through the other.

A number of questions were subsequently asked, and the lecturer was cordially thanked for his discourse.

RIMPLE cover papers and boards are produced by Barton's Paper and Cardboard Co., Ltd., Birmingham, in a variety of substances and shades. They are of very excellent quality, and all have that air of distinction associated with the Barton products. The designs printed on the samples are sufficient proof of the wonderful effects to which these products lend themselves. Bartons are also issuing a series of Japanese and fancy tissue papers in eleven colours of very fine texture and design.

The Marzio Overlay Process.

As a step forward, the Marzio overlay process, which is now being used by many of the leading printers in this country, lends itself to the progressive stages of making ready in a manner entirely distinctive from any other method now upon the market. No chemicals are used in its production, the relief being obtained by the application of two powders to the printing sheet. The method of procedure enables the machine manager to make ready his forme in the ordinary way, all blocks being underlaid to correct height, and the first preliminary tuning up bringing all low parts up to the required strength of impression. When this stage is reached the special ink used in its preparation may be run up, a full body of colour equal to half as much again as is required in ordinary good printing being used. The forme should then be thoroughly cleaned, a pull taken to ensure everything being quite level, and all plates giving their full printing face value. The forme should next be thoroughly inked by rolling it several times, the rollers being then lifted clear of the forme, which should be allowed to stand two or three minutes to allow the ink to settle itself. This slight resting is essential to the process, to ensure obtaining full value in relief. An impression should next be obtained on the special paper supplied, to form the basis of the overlay. This sheet should be laid flat upon a table, and a sufficient quantity of Powder No. 1 poured over the whole surface requiring it. This should be gently pushed with the broad brush in each direction along and across the sheet, both ways, care being exercised that only the powder comes in contact with the surface desired to be brought into relief first. It is essential that this detail be strictly observed, as, should the fingers, or the brush, or any other material, touch the printed surface before the powder, the overlay will not be a success. A little gentle forward pressure of the brush used in propelling the powder on its journey will help it to affix itself to the inked surface upon which it builds up the relief. This operation accomplished, all surplus powder should be shaken off, and also removed from any part where relief is not desired.

The sheet should then be placed flat on the table and a sufficient quantity of Powder No. 2 should be poured over one end of the sheet, and gently propelled over with the broad brush along and across the sheet in both directions. The brush should be held upright for this operation, and every part of the printed surface where relief is desired covered. This operation slightly changes the colour of the overlay and also cleans out the lighter tones. All surplus powder should now be removed from the sheet, and the overlay is ready to be placed in position. At this stage the process lends itself to such treatment as will enable the operator to bring into being those delightful touches of individuality that are dear to the artistic craftsman. With one of the finer brushes the powder may be entirely removed from any part of the overlay where extra lightness is desirable. Delicate clouds, fleecy and floating, can be produced, intense lights of interior views can be enhanced, the horizon or the landscape can be given correct distance, and waves in seascapes be given that pleasing foam crested roll so often desired. In portraiture delicate contours and facial expression can be rounded off or lightened in a most artistic and distinctive manner. This accomplished, the overlays in one sheet may be placed in position, and over them an adhesion sheet may be placed. This sheet is first to be sponged with Fixing Compound No. 3, which should be evenly distributed and all surplus compound removed with a rag from both sides before being placed in position over the sheet containing the overlays. An impression may then be pulled and all superfluous items showing removed. A second adhesive sheet, correctly prepared, may then be put up. Several impressions may be pulled to settle the overlays firmly and a final tuning up of the whole forme given where required. Materials for the Marzio overlay process are supplied by Messrs. A. W. Penrose and Co., Ltd., of 109, Farringdon road, London, E.C.1.

PAPER is among the articles to be exhibited at a permanent commercial exhibition to be opened at La Paz on the occasion of the centenary of the foundation of the Republic of Bolivia in August.

Government Contracts.

Contracts were entered with the following firms during January:—

H.M. Stationery Office.

BINDERS.—C. Cakebread, Ltd, London, E.C.; Lamson Paragon Supply, Ltd., London, E.; G. Wells and Co, London, E.C.; Waterlow and Sons, Ltd., London, E.C.

PRINTING, RULING AND BINDING, ETC.

15,000 Books Certificates of posting Registered Packets.—McCorquodale and Co, Ltd., Wolverton.

Binding 230 "Notes on the Interpretation of Air Photographs"—Kelly and Sons, London, W.C.

Binding 2,500 Public General Acts, 1924.—Dow and Lester, London, E.C.

200,000 Registry Jackets.—Willmott and Sons, Ltd., London, E.C.

7,500 D. 491; 2,000 Books S. 322.—Waterlow and Sons, Ltd., London, E.C.

25,000 Regional File Jackets.—Morrison and Gibb, Ltd., Tanfield.

Binding 5 000 Sailors' Bibles.—Dow and Lester, London, E.C.

7,5 0 Money Order Cash Books; 900 Head Office Cash Books.—Drake, Driver and Leaver, Ltd., London, E.C.

Binding 375 each Chronological Table and Index to Statutes Vol. 1 and 2.—Fisher Bookbinding Co. (1912), Ltd., London, S.E.

167,325 Form No. 11—1.—H. Howarth and Co., Ltd., Manchester.

Binding 3,000 Text Book of Gun Carriages and Mountings.—G. and J. Kitcat, Ltd, London, E.C.

4,000 Provincial Sub Office Cash Books.—McCorquodale and Co., Ltd., Wolverton.

283,350 Forms 12A and 12 Ins.; 201,650 Forms 11A and 11—1.—Metcalfe and Cooper, Ltd., London, E.C.

2,000 Books, S. 353.—Waterlow and Sons, Ltd., London, E.C.

Binding 1,098 Technical Report of the Advisory Committee for Aeronautics, 1921-2.—Fisher Bookbinding Co., Ltd., London, S.E.

4,320,000 N.H.I. Cards, Class A.; 2,335,000 N.H.I. Cards, Class E.—Mackie and Co., Ltd., Warrington.

526,720 Form 11 E.; 110,175 Form 11 E—1.—W. P. Griffith and Sons, Ltd., London, E.C.

ENVELOPES.—J. Dickinson and Co., Ltd., Hemel Hempstead; McCorquodale and Co., Ltd., Wolverton.

PAPER OF VARIOUS DESCRIPTIONS.—J Brown and Co., Ltd., Penicuik; W. Burt, Whichampton Mills, near Wimborne; Caldwell's Paper Mills Co., Ltd, Inverkeithing; Caribonum, Ltd., London, E.; A. Cowan and Sons, Ltd., Penicuik; R. Craig and Sons, Ltd., Airdrie and Caldercruix; J. Cropper and Co., Ltd., Kendal; J. Dickinson and Co., Ltd., Hemel Hempstead; Ellams Duplicator Co., Ltd., Bushey; P. Garnett and Sons. Ltd., Otley; D. Gestetner, Ltd., London, N.; Golden Valley Paper Mills, Bitton; Imperial Paper Mills, Ltd., Gravesend; W. Joynson and Son, St. Mary Cray; London Paper Mills, Ltd., Dartford; New Northfleet Paper Mills, Ltd., Northfleet; Olive and Partington, Ltd., Glossop; Packing Materials Association, Ltd., Manchester; Ramsbottom Paper Mill Co., Ltd., Ramsbottom; Read Manufacturing Co., Ltd., Hounslow; Silkate, Ltd., London, S.E.; Spicers Ltd., London, E.C.; Waterside Paper Mill Co., Ltd, Darwen; Wiggins, Teape and A. Pirie (Sales), Ltd., Bucksburn and Hele; E. Towgood and Sons, Ltd., Sawston.

PARCHMENT.—H. Gibbs and Sons, Mitcham.

PORTFOLIOS.—Letter Filing Appliances Co., Birmingham; T. Shackleton and Co., Manchester.

Crown Agents.

METAL, MONOTYPE.—Phosphor Bronze Co, Ltd., London, S.E.

PAPER.—North of Ireland Paper Mills, Ltd., Ballyclare, Co. Antrim; C. Baker, London, E.C.; Team Valley Paper Mills, Ltd., Gateshead-on-Tyne.

STATIONERY.—Waterlow and Sons, Ltd., London, E.C.

Specialists in Machinery and Processes for the Printing and Allied Trades.

Machinery for Sale.

GOLDING TREADLE, 11 by 7, perfect, working, £30; Ditto, F.F. Hand Platen, £15; Peerless, 8 by 5, easy running, £17 10s. Wanted, F.F. Bremner Platen.—Weston, 53, Eaton-rise, W.5. Ealing 3067. 14585

ONE DEXTER FOLDING MACHINE, takes from 22-in. by 38-in. to 42-in. by 61-in.; delivery can be taken at third or fourth fold. The machine is complete with Dexter Automatic Pile Feeder. The folder itself has been entirely refitted, together with new gears, etc.

ONE DEXTER FOLDING MACHINE, takes from 22-in. by 38-in. to 42-in. by 61-in.; delivery can be taken at third or fourth fold. The machine is also complete with Dexter Automatic Pile Feeder.

ONE BREHMER FOLDING MACHINE, taking a maximum sheet of 30-in. by 40-in. and giving four right angle folds.

ONE SALMON (Quad Demy) VICTORY FOLDER, giving four right angle folds and two parallel folds.

ONE SALMON (Quad Demy) FOLDER, giving four right angle folds only.

A low price considered for quick sale.—Spottiswoode, Ballantyne and Co., Ltd., 1, New-street-square, London, E.C.4. 14581

OWING to removal J. J. Keliher and Co. have for disposal the following machines, which can be seen running at 11, Marshalsea-road, S.E.1, by appointment. Offers are invited.

A No. 7 Quad Demy "BABCOCK" Drum Cylinder Printing Press, fitted for power with two bowl rails, pneumatic buffers, steel ink knife, geared inkers, flyers, automatic counting apparatus and jogger-up, together with the "Dux" automatic paper feeder, with automatic rising table and all running accessories.

An Eight-Crown "HUBER" Two-Revolution Printing Press, fitted for power, with four bowl tracks, geared inkers, geared distributors, steel ink knife, flyers, automatic counting apparatus, together with the "Dux" patent automatic paper feeder and all running accessories.

An Eight-Crown Babcock "OPTIMUS" Two-Revolution Printing Press, fitted for power, with two bowl tracks, geared inkers, geared distributors, steel ink knife, automatic counting apparatus, flyers, delivery printed side up.

A No. 7 Quad Demy BABCOCK STANDARD Drum Cylinder Printing Press, fitted for power, with two bowl tracks, air buffers, geared inkers, steel ink knife, flyers, automatic counting apparatus and jogger-up. 14576

SECOND-HAND MACHINERY.—If you are wishing to dispose of Second-Hand Machinery relating to the Printing, Bookbinding, Box-making, Envelope and Bag-making Trades, etc., secure prompt and effective service by advertising in the *British and Colonial Printer and Stationer*.—Apply for special rates to the Publishers, Stonhill and Gillis, 58, Shoe-lane, London, E.C.4.

SMYTH-HORNE, LTD.,
1-3, Baldwin's-place,
Gray's Inn-road, London, E.C.1.

Occasionally we have Rebuilt Smyth Book Sewing Machines to offer, such Sewers having been thoroughly overhauled and refitted with New Standard Parts where necessary. We erect and teach on a trial basis.—Box 13993.

TREADLE PAGING MACHINE, by Barclay; 5 Wheels, Steel Figures; nearly new. Holt Etching Machine, new Earthenware Bath, Aluminium Covers, and ready for use.—Write, William Sessions, Ltd., Earswick, York. 14582

Postage and Taxation.

AS TIME wears on towards the introduction of Mr. Churchill's Budget, controversy becomes more acute upon the subject of the restoration of penny postage. Those who demand cheaper postal services are being opposed by those who champion the reduction of income-tax. Thus Mr. Harold Cox writes this week in *The Times* urging the greater importance of tax reduction as compared with any concession in postal rates, and contending that it is unfair that the general tax payer should be taxed for the relief of certain trades that make large use of the post. In respect of such contentions it should be kept clearly in mind that the printing industry does not demand, and never has demanded, that the tax-payer should be asked to subsidise the Post Office. What is urged is that it is unfair and unreasonable that the users of the post should be expected to pay postage at rates calculated not only to make the Post Office self-supporting, but also to provide a surplus to be used for the reduction of income-tax, *i.e.*, that users of the post should be taxed for the benefit of payers of income-tax. To utilise the Post Office surplus for the reduction of postal rates would not only mean relief fairly granted to those from whose pockets the surplus comes, but it would mean also a vast increase in the use of the post, with a consequent most beneficial stimulation of trade and commerce in every direction.

Rating Questions.

CONSIDERABLE interest is being aroused in the printing industry by the fact that the Government intends, in the present Parliamentary session, to present a Rating and Valuation Bill which will be of a comprehensive character. We learn that the Federation of Master Printers, with a view to safeguarding the interests of printers in matters of rating and valuation, is taking steps to convene a special committee to consider the subject, the committee to be composed entirely of members who have had actual experience in assessment work on local authorities. Not only the main features but also some minor points in the Government Bill will need careful watching. One such point will be the transferring of powers from smaller local authorities to larger bodies. Such transferring is likely, apart from other results it may entail, to disturb a very large number of printing contracts.

January's Paper Imports.

TRADE for the first month of the year in both imports and exports of paper compares very favourably with the returns of recent months, and also with a year ago. Last month's imports—1,217,039 cwts.—indicate an increase of 291,990 cwts. (31·5 per cent.) over January twelve months ago, and of 235,510 cwts. (23·9 per cent.) compared with the corresponding month of the preceding year. The value of the imports of paper and cardboard last month—£1,239,751—shows increases respectively of £199,576 (19·1 per cent.) and £209,025 (20·2 per cent.) against the shipments of January last year and the preceding year. Of the various descriptions of paper in the import list, packings and wrappings (386,452 cwts.) were the largest item, revealing an increase of 70,014 cwts., compared with January twelve months ago, and a proportion of 31·7 per cent. of the total quantity received during the month. Strawboards (331,598 cwts.) were a substantial item, representing an advance of no less than 190,315 cwts. (nearly 135 per cent.), contrasted with the arrivals of twelve months ago. Deliveries of printings (219,006 cwts.) reveal a decline of 9,139 cwts., whilst millboards (136,802 cwts.) advanced by 29,678 cwts.

Imports of Printings.

NEWFOUNDLAND occupied the most prominent place last month among the suppliers of printings to the British market, with 76,900 cwts. With regard to shipments from Norway (58,696 cwts.), Finland (53,295 cwts.) and Sweden (50,379 cwts.) in January, those from the first-named country exceeded the figure of twelve months ago by 11,196 cwts. On the other hand, printings from Finland declined by 45,961 cwts., and those from Sweden dwindled to the extent of 28,242 cwts. Coated papers from Germany last month (8,182 cwts.) were down by 1,133 cwts. Belgium's contribution in this class of manufacture, however rose from 1,380 cwts. to 2,900 cwts.

Eyre and Spottiswoode Pension.

There was a large gathering at an excellent concert held at Carr's Restaurant, Strand, on Friday, in aid of the funds of the King's Printers' Auxiliary to the Printers' Pension Corporation (Messrs. Eyre and Spottiswoode, Ltd.). Mr. Harry Budd occupied the chair, and amongst those present were Messrs. Chas. Palmer (Controller of Eyre and Spottiswoode, & president of the Auxiliary), W. C. Cooper, F. C. Napier, J. Fleming, J. Dixon, R. T. Apps, J. J. Rawlings, W. H. Hillman, J. Southey, J. Pearson and W. J. Franklin (collector, Printers, Pension Corporation). The amount of the plate was approximately £101, a sum which will enable the Auxiliary to complete Pension No. 6.

Mr. Chas. Palmer, in proposing a vote of thanks to the chairman, referred to the zeal shown by Mr. Budd in connection with the evening's efforts.

Mr. Budd, in returning thanks, said he thought it unnecessary to enlarge on the work of the Printers' Pension Corporation. He expressed his gratitude to all present and absent for the support so generously given. They did not need to be reminded of the fact that the great organisation they were supporting that evening was one of the most economically and efficiently managed concerns in the world.

The fine musical programme—by Wilfred Stracey's Concert Party—proved very successful.

Lead Poisoning in the Printing Trade.

Mr. W. C. Warren addresses the Electrotypers Stereotypers Managers Overseers' Association.

There was a moderately good attendance of members of the above Association at the February meeting, held on Tuesday of last week, at 80, Blackfriars-road, under the chairmanship of Mr. A. Chadwell (president). The principal business of the evening was an address by Mr. W. C. Warren (general secretary of the National Society of Electrotypers and Stereotypers), who dealt in practical and interesting fashion with the subject of health conditions in the foundry. During the course of the lecture Mr. Warren gave a demonstration of two types of dross container recently put on the market by Fry's Metal Foundry.

Following the reading of the minutes, the chairman announced that the official visit of the Association to the Printing Exhibition had been arranged to take place on Monday, May 25th.

Mr. Warren, who was then invited to address the meeting, commenced by expressing regret at not bringing the matter before the members earlier, as he had intended. He proceeded to say that one of the principal matters he desired to speak about was the risk of lead poisoning to members of their trade. Cases of industrial accidents and disease were constantly being reported to the Society headquarters from all parts of the country, and he believed there were invariably every week two or three fresh cases Proceeding, he went on to say that he was confident many of the accidents occurring could have been prevented had a little forethought and reasonable care been exercised.

The Results of Negligence.

He then enumerated a number of concrete cases where accidents had occurred through negligence. Amongst these he mentioned the case of a man who had been laid up for five or six weeks as the result of having fingers cut. In this case it was found, after investigation, that the glass protecting shield which prevented splinters of metal flying about the air, was broken. Another case was of a man who had a finger cut by a back-plane that was not working correctly. In this case the attention of the firm had been called to the matter, but for some reason or other the machine had never been properly attended to. Another one, which he described as being the result of criminal negligence, took place in a foundry where the firm, with the view of saving expense, secured the services of a Jack-of-all-trades to convert a fire chamber into a steam chamber upon which no safety valve had been placed. After considerable delay, a safety valve eventually arrived at the firm, but it was found to be required for another apparatus in some other part of the building. The result of this was that a few weeks later the newly-converted chamber blew up and nearly scalded to death one of the workers.

Mr. Warren stressed the point that, in each instance he had mentioned, the cases as a result came under the Employers' Liability Act and not under the Workmen's Compensation Act, the employers in every case being forced to pay large sums in compensation. If more attention had been paid to the question of prevention of accidents these misfortunes would never have occurred to their members. In addition to that, the firms where the accidents had occurred would have found it more economical to see that the machinery was in proper working order than to have to pay large compensation claims. Whilst on the subject of the prevention of accidents, he appealed to the overseers present to see that the little details were daily attended to, so that the risks incidental to foundry operations were minimised as far as possible.

Turning more directly to the question of disease, Mr. Warren said he believed they would be surprised at the large number of their members who had been affected by it during the last few years. The Health Committee of the Joint Industrial Council had been fortunate in securing the assistance at the Home Office of Dr. T. M. Legge, who had given the industry the benefit of his experience and statistics of the cases that had been reported. They must not forget, however, there were a large number of cases that were never reported. During the past twelve years fifty-five stereotypers were reported as suffering from lead poisoning, two electrotypers and forty-one other men connected with foundry departments. These figures meant that practically every six weeks there was one reported case of lead poisoning during the period covered by the statistics. These figures were strong enough to convince everybody connected with their trade of the necessity to do all that was humanly possible to minimise the risks of disease.

Dealing with the risks of lead poisoning incidental to the handling of metal in the

Mr. W. C. Warren.

foundry Mr. Warren was of the opinion they were not very great so far as clean metal was concerned. Explaining some of the causes of lead poisoning, he proceeded to say that lead can be inhaled in two forms. The action of oxygen in the air on the metal itself causes a gas, which, of course, is practically lead oxide gas. He did not think there was any serious risk so far as lead poisoning was concerned from the gas thus naturally formed. The properly conducted foundry had a system of drawing off the gas before it was able to do any serious damage.

The Sweating of Dross.

The greatest risk of all was from the lead oxide that was formed in dross. In many offices in the past it had been the custom to pitch the dross on the floor in a corner of the room with the result that there was raised a form of fog which made it impossible for the men in that room not to inhale some of the lead oxide, which eventually got into their systems. A far worse thing even than that was the practice adopted in many foundries of re-sweating the dross for the purpose of further extracting the metal left in it. After this further process the re-sweated dross had reached the stage when it was commercially pure lead oxide—he would not say chemically pure—but sometimes it was again carelessly dumped on the floor, and again the workers breathed into their lungs the fog that arose from this lead oxide.

Speaking of the attention paid to this question by the Joint Industrial Council, Mr. Warren said that one of the very first things this body did was to come to a definite decision on this question and to recommend that under no circumstances whatever was dross to be re-sweated in the ordinary foundry. The council also recommended that all dross, directly it comes from the melting pots, should be taken from the foundry and sent to the metal refiner. It was the serious consequences of this dross question that caused Messrs. Fry to exercise their brains in bringing out their new dross containers.

Mr. Warren then gave a practical demonstration of the application of the two types of Fry apparatus, showing how the dross is stored out of the way until it is ready to be carted away. He explained that these dross containers are made in two sizes, a small one with a holding capacity of 100 lb. of dross—suitable for smaller works—and a larger one of 200 lb. capacity for the larger foundry.

Continuing, Mr. Warren said during the last two or three months he had found the employers very sympathetic in introducing any kind of machinery likely to be of advantage to the health of the men. Regarding the introduction of this apparatus he always came up against the question of floor space. He wished to make it clear that these containers of Messrs. Fry's took up very little floor space, being less than 12 in. square. Up to the present 180 firms throughout the country had installed the smaller type of container and twenty the larger size. He emphasised the fact that he welcomed any apparatus that was put on the market—no matter by what firm—if it was likely to be of benefit to the health of the worker.

After reading a doctor's certificate regarding the awful effects of lead poisoning, Mr. Warren concluded by drawing attention to the imperative necessity of trying to do everything possible to eradicate the risk of disease. In this respect he desired to enlist the sympathy of the members of the Association with a view to giving serious attention to the possibilities of the dross container as quickly as possible. To spend money on apparatus that would eliminate the risk of men getting lead poisoning through handling lead oxide was very much better than giving money towards sending them away to convalescent homes after they had got the lead into the system.

Discussion.

Mr. J. Black (vice-president) in opening a discussion, said he could not offer any practical suggestion with regard to the new dross containers that had been so ably demonstrated. However, he could not help but express admiration for the way the whole question had been put before them. He congratulated Mr. Warren on the way in which he was championing the cause of a more healthy foundry and his advocacy of the dross container method to prevent disease.

Mr. Warren at this point mentioned that the containers demonstrated that evening were the property of the Society, by whom they had been purchased from Messrs. Fry.

Mr. R. E Latimer spoke of the prevalence of carelessness amongst men in the foundry whilst handling dross.

Mr. J. S. Sunderland alluded to his experiences whilst handling antimonial shrapnel bullets during the war, and the effects therefrom of contact poisoning. He thought it would be a good thing if leaflets were circulated throughout the trade showing the dangers arising from this cause among compositors, machinemen and foundry workers.

Mr. Glen Steele (Messrs. Jubbs) thought the whole question had been well put up by Mr. Warren. The devices he had placed before them seemed to be practical and well thought out, and no objection could be raised on the score of expense. Speaking of contact poisoning, he believed it was a fact that very rarely were men who actually handled the dross after it left the foundry adversely affected by it. He agreed with Mr. Sunderland that literature should be circulated throughout the trade emphasising the advantages of cleanly habits. As a matter of fact he thought the whole question was largely one of individual care and attention.

Mr. W. E. Longley, in proposing a vote of thanks, expressed the indebtedness of the meeting to Mr. Warren for bringing before the members the terrible evils caused by lead poisoning.

Mr. Black seconded the proposition, which was very heartily carried.

Mr. Warren, in briefly returning thanks, said there was no more important duty of a trade union leader than to see that reasonable health conditions prevailed in the trade he represented.

MESSRS. P. GARNETT AND SON, LTD., Otley, are turning out some excellent duplex papers and boards made on their new machine. Samples sent to us by their London agents, Messrs. Harold Spalding and Co., are of very good quality indeed and reflect the greatest credit on the manufacturers. They are of various substances and shades, and include duplex filing manilla, duplex silk boards, duplex sampling and lined duplex folding boxboards, all admirably adapted for their purposes.

PHILIPSON AND SON, LTD. (process engravers, etc.).—Further charge on 22, Oxford-street, and 8, Snowdon street, Newcastle-upon-Tyne, dated February 5th, 1925, to secure £500. Holders: Rock Permanent Benefit Building Society, 14, Market street, Newcastle-upon-Tyne.

VIBRO, LTD. (advertising contractors, etc., London).—Particulars filed of £5,000 debentures authorised January 20th, 1925, charged on the company's property, present and future, including uncalled capital, the amount of the present issue being £200.

DERBY PAPER STAINING CO., LTD.—Debenture charged on the company's undertaking and property, present and future, including uncalled capital (subject as to freehold property, to existing mortgage thereon for £4,500), dated February 6th, 1925, to secure all moneys due or to become due from the company to the Westminster Bank, Ltd.

RECEIVER APPOINTED OR RELEASED

MERTON BOARD MILL, LTD.—E. Portlock, of 186, Bishopsgate, E.C., was appointed receiver and manager on February 6th, 1925, under powers contained in debenture dated October 30th, 1922, in place of H. Portlock of the same address who has ceased to act as receiver.

BANKRUPTCIES, etc.

Re LEWIS LEVIN, Paper Bag Manufacturer, 20, Old Gravel-lane, Wapping.—The public examination of this debtor was held on February 20th, before Mr. Registrar Francke at the London Bankruptcy Court, the accounts showing total liabilities £1,838 (unsecured, £1,503), and net assets valued at £6 after deducting £26 for payment of the preferential claims. In reply to Mr. F. Vyvyan, official receiver, the debtor stated that he came to this country from Russia in 1902, and a year later commenced business at his private residence, removing in 1921 to the above address, where he traded till the date of these proceedings. Witness attributed his insolvency to his inability to obtain paper during the summer of 1923, to instalments paid on, and depreciation in value of, machinery, and to loss of £306 by bad debts. The depreciation in value of machinery, stock, fittings and fixtures amounted to £1,035, repairs to machinery cost £150, and the instalments paid under the hire-purchase agreement came out at £710. The examination was concluded.

Re WM. ROWE AND CO.—A sitting of the London Bankruptcy Court was held on February 17th before Mr. Registrar Mellor for the public examination of Wm. Rowe, who carried on the business of a paper merchant at 29, New Bridge-street, E.C., under the style of "W. Rowe and Co." The debtor applied to pass upon accounts showing liabilities £1,699, against assets valued at £58. Replying to Mr. D. Williams, official receiver, he stated that he was born in Dublin, and prior to 1916 he was employed in Ireland as a traveller in the paper, printing and allied trades. He came to England in October of that year, and in 1921, he started business as above on his own account. He attributed his failure to loss in trading brought about principally by heavy overhead charges, selling at a small margin of profit, and in a lesser degree to selling under cost price. The examination was concluded.

MESSRS. R. HOE AND CO., LTD., send us an advertising broadside containing an impressive list of recent orders for Hoe presses, showing the great popularity of Hoe machinery in all parts of the world. The latest order, we understand, is one for twenty-four 16 page "Superspeed" units for Associated Newspapers, Ltd.

Dobson, Molle and Co.

Edinburgh Business Sold for £37,500.

In the Court of Session, Edinburgh, on Wednesday of last week, Lord Blackburn disposed of a note for J. Aikman Smith, C.A., Edinburgh, and George H. Carphin, C.A., Edinburgh, the liquidators of Dobson, Molle and Co., Ltd., St. Clair Works, Easter-road, Edinburgh.

The note stated that on February 3rd, 1925, the liquidators received an offer from Messrs. E. S. and A. Robinson, Ltd., Bristol, for the purchase of the whole business and assets of the company, including works, machinery, goodwill, etc., as a going concern, for the price of £33,000.

The Committee of Inspection was equally divided in opinion as to the advisability of accepting the offer, a course which the liquidators recommended. After discussion, and an abortive attempt to induce Messrs. Robinson to increase their offer, the committee agreed, should no better offer be received by February 5th, to accept Messrs. Robinson's offer, subject to the subsequent sanction of the court.

On the date when it was necessary for the liquidators to accept provisionally that offer —February 6th—they received an informal offer on behalf of Mr. R. H. Ruddock, 71, Fleet street, London, for the purchase of the business for £36 000. This offer was confirmed by a formal offer received on February 10th

The note pointed out that the negotiations with Messrs. Robinson were practically completed before the other offer was received, and that their offer was to purchase the business as a going concern, thereby avoiding possible claims against the company for breach of contracts entered into by the liquidators while carrying on the business. Mr. Ruddock did not offer to purchase the business on these terms

Messrs. Robinson subsequently increased their offer, and Mr. Ruddock did likewise.

In the end Lord Blackburn authorised the liquidators to accept Messrs. Robinson's offer of £37,500 for the business.

Merchandise Marks Act.

A deputation representing manufacturers and traders attended at the Board of Trade last week to discuss the lines on which future legislation could be undertaken to render the Merchandise Marks Act more efficient. Mr. A. E. Goodwin was present to represent the Federation of Master Printers. The deputation was received by Sir Sydney Chapman and other permanent officials of the Board of Trade.

Some speakers contended that there was little need for any alteration. Mr. Goodwin remarked that a considerable quantity of printed matter was now coming from abroad bearing no indication of its origin, and Continental printers were canvassing for orders, stating that there was no necessity for any mark of origin to appear; the fact that such statements were made indicated clearly that the British public were being deceived. He produced several specimens and referred particularly to local view picture post cards, which most people would assume to be of British manufacture unless their foreign origin were specially indicated. He also produced cigarette cartons, the printing of which had been done abroad, but which bore wording claiming that the goods were of British manufacture He specially urged that the Act should be amended so that it would cover not only goods sold but anything distributed for advertising purposes.

This claim was endorsed by a Sheffield manufacturer who complained of pocket knives being distributed for advertising purposes bearing the names of well-known British firms, the goods themselves being of foreign origin. A representative of the brush industry also stated that the workers and employers were united in their demand that the British public should know where the goods they bought were produced, it being said that many retail shopkeepers were quite ignorant as to the true source of their supplies. They did not ask for any measure of protection, but claimed that consumers should not be subjected to deception.

From the London Gazette.

PARTNERSHIP DISSOLVED.

G. Tillotson, H. B. Hemingway and J. Y. Sorton, printers and advertising specialists, 7, Park-square, Leeds, under the style of the City Press, so far as regards G. Tillotson.

BANKRUPTCY ACT, 1914.
RECEIVING ORDER.

Thomas Sawyer and Co., 10 and 12, Ludgate-hill, E.C., paper agents. Public examination, March 24th, at Bankruptcy-building, Carey street, W.C.

Calendars, etc., Received

MESSRS. R. W. CRABTREE AND SONS, LTD., have issued a daily tear-off calendar suitable for either wall or desk. The "Ensign" Super Offset is featured on the card mount, and each leaf of the tear-off pad carries a short quotation from some well known writer.

THE calendar issued by Messrs. H. W. Caslon and Co., Ltd., features a reproduction in colours of the familiar painting of William Caslon I. Monthly tear-offs are mounted on a brown board to which some excellent printing in Caslon Old Face, with appropriate borders, gives added dignity.

THE latest issue of the Monotype Recorder (No. 204, Vol. XXIII), contains a well written article on "The Revival of Good Printing," together with other matter of general interest. The issue is printed by Messrs. Geo. Falkner and Sons, Manchester, of which printing firm a short history is included.

MESSRS. E. HAMEL AND CO., process engravers, of Nottingham, send a monthly tear-off calendar adorned with a well-executed example of multi-colour block printing.

HENRY AND LEIGH SLATER, LTD., Macclesfield, have employed an improved quality chromo board of their own manufacture for a 1925 calendar. The reproduction of "Nature's choicest gifts" is a wonderful example of vivid and accurate colour printing and is at once a tribute to the art of the printer and the craft of the board maker.

Necrology

Mr. William Jordan.

The death occurred at Boscombe on Saturday of Mr. William Jordan, chairman of Messrs. Jordan and Sons, Ltd., company registration agents and printers, Chancery-lane. Born in Bedfordshire in 1840, Mr. Jordan as a young man was a press corrector on *The Times* and the *Standard*. In 1876 he joined his elder brother Richard, who, since 1863, had been carrying on business as agent for the registration of companies under the 1862 Companies Act, and they were joint authors of a "Hand Book on Joint Stock Companies." After the death of his brother in 1889 Mr. William Jordan was joined in the authorship by Mr. F. Gore Browne, and this association was maintained until the death in 1918 of his collaborator (then Sir Francis Gore-Browne, K.C.).

The Progress of Typography.

At the last monthly meeting of the Leicester Centre of the Printers' Managers and Overseers Association the principal feature of the evening was a lecture by the hon. secretary, Mr. W. H. Crane, who provided an informative review of the history and progress of the art of typography. References were made to the outstanding figures of the past in the development of fine printing; the changes in typographic style were dealt with, and mention was made of the principal inventions that have contributed to the important position of the printing art at the present day. Amongst special printing methods referred to were xylography, woodburytype, collotype, photogravure, heliotype, copper-plate and music printing, and also to lithography and offset printing, a brief description of the various processes being given.

MAY 16 to 30, 1925!

Trade Union Matters.

MACHINE RULERS.—Following the conference of the Machine Rulers with the Federation of Master Printers, when they put forward an application for an increase of 12s. 6d. per week, and were told that the policy of the Federation was to stabilise wages, a general meeting of members decided to stop working overtime and also not to fill up time sheets until their demands were conceded. Attention has been called by the employers to this irregular and unconstitutional nature of this action, and particularly to the fact that due notice was not given for any proposal to alter working conditions, and that the matter was not reported to the Joint Industrial Council.

THE Executive of the Typographical Association have issued to the membership a ballot paper, returnable on March 10th, setting forth the proposals made by the employers for time off to daily newspaper members, also a proposal to increase the wages of this section, and two other minor proposals with regard to tea money and payment at overtime rates for work done during meal times. The Executive Committee points out the serious nature of the proposals and asks members to give them careful consideration.

T.A. AND WAGES INCREASE.—At a recent meeting of the Executive Council of the Typographical Association, a resolution was read from the Committee of the South Wales Group viewing with alarm the continued increase in the cost of living, and pressing upon the Executive Council the urgent need for initiating a movement for an increase of wages. The Executive Council directed the resolution to be placed along with other similar resolutions for further reference.

GAMMETER MACHINES.—Following upon an inquiry by the secretary of the Typographical Association as to whether the installation of Gammeter multigraph machines, either hand or motor driven, came within the provisions of the Factory Acts, His Majesty's Inspector of Factories has written that in the past it had not been the practice of the Factory Department to regard the Factory Acts as applying to premises in which typewriting and multigraphing was done, but in view of the extended use of the Gammeter machines the question was being further considered. The Executive Council have forwarded this letter to the General Council of the Trades Union Congress, with a request for their assistance in the matter.

COMPENSATION CLAIM AT WARWICK.—The Executive Council of the T.A. have had under consideration a statement from a member of the Warwick and Leamington branch who reported that he had met with an accident while following his employment, which resulted in the loss of the first finger of his left hand. The Council decided that a claim for compensation should be made, and the matter has been placed in the hands of a local solicitor.

A CLERK AND PRINTING LESSONS. — The secretary of the Preston branch of the Typographical Association has reported to the Executive Council on a difficulty that has arisen with regard to the proposed training of a clerk employed by the Blackpool Corporation in the art of practical printing at the Harris Institute. A deputation from the branch had met the Council governing the Institute, when the following particulars from the will of Mr. Harris were put forward with the request that the Executive Council should be asked to give a decision thereon:—"All benefits of the Institute shall be open to all residents in Preston and the neighbourhood, subject only to such reasonable restrictions as the Council may impose." The Executive Council, however, after consideration of the case, have decided that the training of a clerk in practical printing cannot be allowed.

CROSS WORD PICTURE POST CARDS.—Messrs. Raphael Tuck and Sons, Ltd., have now issued a second set of their Cross Word Puzzle Post Cards. They inform us that the first set has already proved a great success, this humorous and up-to-date series having been well received in all parts of the country.

OUT of 13,100 members of trade unions in the paper and pulp industry of Sweden, the percentage unemployed at September 30th was 1·9, which compares with 2·4 at August 31st and 2·8 at September 30th, 1923.

Homes for Retired Natsopa Members

Another move forward in the direction of providing homes for retired printers was inaugurated on Tuesday of last week, when the Right Hon. J. H. Thomas, M.P., laid the foundation stone of six cottages that are being built by the National Society of Operative Printers and Assistants at their Convalescent Home at Wellsborough, near Market Bosworth, Leicester. These cottages, which are already in an advanced state of erection, will, when completed, give accommodation to Natsopa members of sixty-five years of age who have been members of the organisation for not less than 24 years.

The ceremony was essentially of the nature of a family gathering, those present consisting mainly of several of the original founders of the union.

Mr. Thomas, in a brief speech, referred to the wisdom of establishing memorials of the character of the one they were inaugurating that day in preference to those of a purely ornamental description.

The general secretary, Mr. G. A. Isaacs (who is chairman this year of the Joint Industrial Council), also spoke, explaining the purposes of the new undertaking, and the reasons that had led up to its establishment. In the course of his speech he made eulogistic references to Mr. J. Keep and Mr. F. Quinn, two of the founders.

We understand that the official opening of the new homes at Wellsborough will take place on July 7th, when it is hoped that the industry will be fully represented.

North Wales Notes.

THE annual meeting of the Merioneth, South Carnarvonshire and Aberystwith Master Printers' Association was held at Barmouth on Wednesday of last week, and was largely attended. Captain Lewis Davies occupied the chair, and the meeting was addressed by Mr. Herbert Tomkinson, who is shortly taking over the duties of hon. secretary of the North Wales Alliance, and by Mr. L. J. Cumner, Federation organising official. A lively discussion ensued on the question of chapel reports, tonic sol-fa printing and other work peculiar to the area; among those who took part being Messrs. E. Evans (Bala), E. Williams (Dolgelly), J. C. Edwards (Towyn) and E. Evans (Dolgelley).

CAPTAIN LEWIS DAVIES (Blaenau Festiniog) and Mr. Morris G. Roberts (Barmouth) were re-elected chairman and secretary respectively, and Messrs. J. D. Davies (Blaenau Festiniog) and E. Evans (Bala) were appointed representatives on the Alliance executive.

THE date of the rally for the North Wales Alliance has now been definitely fixed for March 9th at Chester. Mr. W. Powlson, president of the Alliance, will occupy the chair. The president of the Federation of Master Printers (Mr. W. B. Wykes) will address the meeting, and a special afternoon session will be arranged to discuss the question of costing, following an address by Mr. A. D. Hull, Federation cost accountant.

New British Patents.

For the benefit of our readers we have arranged for any inquiries relating to Patents, Designs and Trade Marks to be answered, free of all charge, by a Fellow of the Chartered Institute of Patent Agents. Inquiries should be addressed, in the first instance, to the Editor.

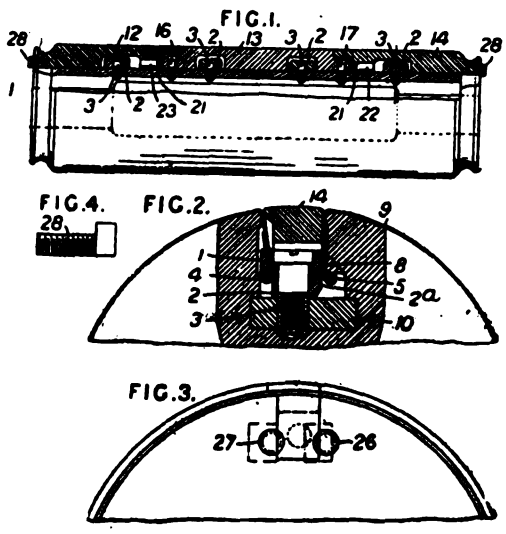
New Inventions

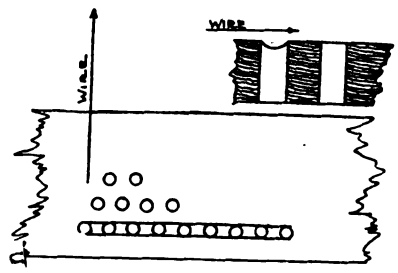
Embossing Presses.



In an embossing press, patented by the Hulse Manufacturing Co., for forming show-cards by cutting out characters from coloured paper and impressing them into the card, the types are held face uppermost in a carriage which is slidably mounted on the bed of a press and guided thereon by a rod 65 on its underside adapted to slide in a hole in the bed. The carriage consists of a flat plate 64, having attached thereto a number of chamfered bars 62, so as to form longitudinal dovetail grooves 61. At the sides of the plate are attached two bars 74, the upper horizontal flanges 75 of which are corrugated. The types are secured in holders 77, 78, having a longitudinal channel 79, 80 at each edge. One form of holder 77 has tongues 87 at its ends provided

with struck up ribs 88 adapted to engage the corrugations in the flanges 75 on the bars 74, whilst in the second form 78 slotted ends 89 are provided with which engage the shanks of bolts 92 slidably held in the longitudinal grooves 61. To ensure that the types are placed in the holders in the upright position, the channels 79, 80 are made of different depths to engage lips 81, 83 of similar thicknesses on the type. Clamping or spacing pieces 93 are secured in the holders by screws 94. Transverse marks 99 on the bars 62 co-operate with the grooves 61 to facilitate the positioning of the type on the carriage. A plate 103 rests on the cardboard, etc., and takes the pressure of the machine, the plate being pivoted to lugs 100 stamped up from the carriage, and having elongated slots to allow of the necessary vertical movement of the plate. A handle 72 is provided for sliding the carriage between the pressure members of the press, and is formed by stamping out a lug 69 to carry one end of the bar 65, the other end of the bar being carried by a screw 70 on the carriage. Means for holding the cardboard and coloured paper in position over the type consist of two angle bars 95 attached to spring members 96, and secured to the carriage 64 by bolts 98, slidably held in the grooves 61.

Attaching Metal Sheets to Cylinders.



In this invention, which is patented by Messrs. A. W. Penrose and Co., Ltd., and Mr. M. Owen, a metal printing sheet is secured to a printing cylinder by attaching one slotted end of the sheet to fixed lugs in a gap in the cylinder and attaching the other slotted end to lugs on adjustable straining members in the gap which also serve to prevent disen-

gagement of the sheet from the fixed lugs. The ends of the sheet 9 are slotted, folded over and reinforced by rods 4, 5, the slots in one end engaging with fixed lugs 8 on the cylinder gap. The slots in the other end engage lugs 1 on members 2 which are pulled toward the bed of the gap to tighten the sheet by studs 3 screwed into the bed of the gap or into a plate 10 attached to the bed. Slots 2a are provided in the members 2 to permit them to fit over the lugs 8 and prevent disengagement therefrom. Capping pieces 12, 13, 14 fit over the adjusting members 2 in the gap, the centre piece 13 being secured by screws 16, 17 to the cylinder and having pins 21 entering holes 22, 23 in the outer pieces so as to interlock with them. The outer ends of the pieces 12, 14 are secured against axial and radial movement by segmental studs 28 which screw into holes 26, 27, formed partly in the pieces 12, 14 and partly in the cylinder, so that a half turn of the studs allows the pieces to be removed or locked in position. The pieces 12, 13, 14 are recessed so as to bridge the members 2. Specification 223,756 is referred to.

Preventing Streaks in Paper.

A little trick which has helped in preventing streaks in paper consists in making a groove joining the first row of holes in the suction box which are encountered by the

wire. This distributes the suction evenly across the sheet, and has proved to be effectual in decreasing the tendency to form streaks, says *Paper Industry*.

Government "Paper Store."

In the House of Commons recently, on a vote for £54,000 for certain public buildings in Great Britain, Mr. S. Webb protested against money being expended on the Stationery Office in Princes-street for electric light and central heating. He understood that the Stationery Department was being moved to a building erected especially for it. Was the policy of transferring offices from these expensive centres to less expensive sites being abandoned? The Government were really running a huge paper store, covering an acre or so of land, in a position only a few hundred yards from the House of Commons. That was extravagant.

Mr. Locker-Lampson said it was intended eventually to sell the site. The money was being spent to enable the people who worked in the Stationery Office to do so under sanitary conditions until other arrangements could be made.

Australian Notes.

Commonwealth Board Mills—Sale Negotiations Abandoned—Re-adjustment of Finances—Alleged Libel on Paper Pulp Shareholder—A £10,000 Claim—Complaint of Government Printing Waste—Gordon and Gotch Profit—Lamson-Paragon Dividend — Edwards Dunlop Capital Increase—New Companies—Fire Destroys Stationery Goods.

(From Our Sydney Correspondent.)

THE shareholders of the Commonwealth Board Mills, Ltd., have received a circular to the effect that negotiations for the sale of the company's undertaking to the Australasian Paper and Pulp Co., Ltd., are now definitely at an end. The price named was £68,500, but it is stated that the Australasian Co. declined to do business at that price.

THE Commonwealth Co. has now decided to proceed with a re-adjustment of the finances on the basis of an issue of debentures amounting to £50,000, at 8 per cent., and having a currency of 10 years. Of the total issue, £32,000 has already been underwritten, and the directors state that they are assured the balance will be speedily forthcoming. It is proposed to increase the authorised share capital from £100,000 to £200,000. Shareholders are to have the opportunity of subscribing for the debentures.

DEVELOPMENTS are foreshadowed at the Commonwealth Mills, and according to the chairman the immediate installation of new machinery should allow of increased output at decreased cost and place the company once more on a dividend-paying basis.

MR. HERBERT R. BROOKES was the plaintiff in a claim for £10,000 compensation against Robert G. Nall, Ltd., in respect of an alleged libel said to be contained in a letter which appeared in the *Daily Telegraph* on June 4th The plaintiff was formerly chairman of directors of the Australasian Paper and Pulp Co., and also a member of the Commonwealth Tariff Board, and he alleged that the letter complained of had been written by the manager of the defendant company, reflecting on his honesty as a member of the Tariff Board

PLAINTIFF stated in evidence, and his statement was corroborated by three members of the Tariff Board, that he took no part in any discussion relating to the matters dealt with in the letter complained of.

THE jury returned a verdict for the plaintiff for one farthing, and answered in the affirmative the judge's question whether the letter written by the defendant company to the editor of the *Daily Telegraph* was any authority to the editor to publish.

ACCOUNTS of Gordon and Gotch (Australasia), Ltd., for the half-year ended September 30th, show a net profit, after meeting taxation, amounting to £33,833, as against £23,437 for the preceding half-year and £26,585 for the September half of 1923. With £468 brought forward, the amount available is £34,301, from which it is proposed to pay dividends at the usual rate of 8 per cent. per annum on preference and ordinary shares, to transfer £13,500 to reserve, and to carry forward the balance.

LAMSON, PARAGON, LTD., of Melbourne, has decided to pay a dividend at the rate of 10 per cent. per annum, for the half-year ended October 31st.

IT is the intention of the board of Edwards Dunlop and Co., Ltd., to offer at the par rate of £1 to ordinary and preference shareholders 100,000 unissued ordinary shares in proportion to the number of ordinary and preference shares held on March 31st, 1925. The shares are to be paid for in full on acceptance on or before April 30th next, advance payments to carry interest of 6 per cent. per annum. The new shares will rank for dividend as from May 1st next, the first dividend being payable on October 31st, 1925. Authorised capital of the company is £1,000,000, in 120,187 preference and 879,813 ordinary shares of £1, of which 86,509 preference and 404,231 ordinary shares have been subscribed, the existing paid-up capital amounting to £490,740.

THE net profit earned by W. E. Smith, Ltd., for the year ended October 31st was £6,532, to which is added £241 brought forward. From the available figure of £6,773, an interim dividend of 3 per cent. has absorbed £3,000, and it is proposed to pay a final dividend of 2 per cent., making 5 per cent. for the year, as against 6 per cent. for 1922-23. A sum of £1,500 is transferred to reserve, leaving £273 to be carried forward.

AMONG recent company registrations are the following: B. C. Systems Press, Ltd., capital £10,000, to take over as a going concern the business of printers and publishers, stationers, etc., carried on by T. and J. Malone and F. G. Conlon at Sydney; Green Press, Ltd., capital £5,000, to acquire the business of Smith and Julius, general printers, stationers, etc.

IN the courts recently, H. E. C. Robinson, Ltd., map publishers, of Sydney, complained that Alfred E. Jones had infringed their copyright on certain maps which had been published in a street directory. Defendant denied the allegations, but at time of writing the case had not been concluded.

A SERIOUS fire in Sydney did considerable damage to premises occupied by Messrs. Deaton and Spencer, printers. Involved in the damage were stocks of printed goods and machinery, the injury in this direction alone being estimated at about £30,000.

BARTONS PAPER AND CARDBOARD CO., LTD., Birmingham, have issued a series of cover papers of great distinction under the name of Emperor. Stocked in size 20½ by 25½ (52 by 65 cm.), they are produced in six effective shades—coral, topaz, ruby, jade, garnet and sapphire. The specimen of embossed colour printing with which each sample has been treated demonstrates at once the artistic effects which can be produced. Emperor covers are a great achievement.

The World's Printing Trade

NEARLY forty years ago "The British and Colonial Printer and Stationer's" Special Quarterly Export Issues were started, to cover the World's Printing Trade.

These special issues were almost instantaneously successful, and to-day "The British and Colonial Printer and Stationer" stands pre-eminent as the printing trade journal, carrying the message of British Print throughout the world.

Without exceeding the bounds of modesty, we can legitimately claim that this journal has made the export departments of certain firms, whilst it has increased the overseas business of its advertisers generally.

It is not for us to presume to instruct supply houses their method of doing business—we can only give you the experience of our advertisers:—

> "It will no doubt interest you to learn that during the past few years we made considerable additions to, and have extended our Export Dept. We thank you for the assistance that your Journal has contributed towards this export business.—C. B., Ltd,

"The British and Colonial Printer and Stationer" specially circulates in the following countries:—

Australasia.	East Indies.	Canada.
India.	West Indies.	United States.
South Africa.	China.	South America.
	Japan.	

The next Special Export Issue will be published on March 19th, 1925.

One of our representatives will be pleased to call upon you at your office, in your time and at your convenience. He is entirely at your disposal, and a conversation can do no harm.

Write us to-day!

FOUNDED 1878. PUBLISHED WEEKLY.

WITH MONTHLY SECTION FOR THE BOOKBINDER.

The Recognised Organ for Printers, Printers' Engineers, Wholesale and Manufacturing Stationers, and Makers of Machinery and Appliances for the Paper Bag, Envelope, Box-making, Bookbinding and all Paper and Board Consuming Industries.

VOLUME 96. NUMBER 10. [REGISTERED AS A NEWSPAPER.] LONDON: MARCH 5, 1925. EVERY THURSDAY. PRICE TWOPENCE.

Can Bond Papers be Standardised?

United States Government Printing Office Tests.

By WILLIAM BOND WHEELWRIGHT.

On June 5th, 1924, the Testing Section of the United States Government Printing Office issued a tabulation of test results on commercial bond and ledger papers representing a special investigational work by the Government Printing Office in co-operation with the United Typothetæ of America. In the following paper, which appeared in the "Paper Trade Journal" (N.Y.), these tables have been rearranged in order to make their significance clearer, and to place the subject of standardisation before the public in a way that may be easily understood.

The United States Government purchases its paper on definite specifications. The United Typothetæ of America, believing that it would be advantageous for its members to purchase papers on a similar basis, has carried through in co-operation with the Testing Section of the Government Printing Office, valuable and exhaustive analyses of 94 bond papers and 39 ledger papers submitted by different mills.

Some manufacturers allege that it would be impractical to set up definite standards of quality since the necessary tolerances allowed for normal variations due to the exigencies of papermaking are so great.

Nevertheless, a considerable number of manufacturers bid regularly on Government contracts for papers which have to conform with certain specifications, and as a matter of fact the number of rejections under these contracts has been almost negligible. This experience may be considered in relation to the claim that paper specifications are impractical, but whether it would be of advantage to the allied trades of printing and paper if the commercial grades of bond and ledger papers should be made available on a basis of specifications to be agreed upon is another matter.

Grades of bond Paper Excessive.

In an article published by the writer in 1919 which had more or less wide circulation, it was pointed out that the number of different grades of bond paper on the market were excessive, and these grades so closely overlapped one another as to defy recognition and to confuse the buyer of paper. The advantage of eliminating a certain number of grades so that there would be a difference of quality between the established grades that would be appreciable to the average consumer was suggested. Economic advantages springing from the release of capital tied up in numerous unnecessary brands was referred to as one way of reducing the high cost of distribution and manufacture.

Since that time, several manufacturers have reformed their grades along these lines, but, in the absence of any general scheme, the situation at large is not greatly improved, and cannot be greatly improved without the acceptance of a programme along the lines of the "limitation of armaments." It is due to competition and price-cutting that these intermediate grades exist, and while their introduction may have been of temporary advantage to individuals, the continued policy of "dog eat dog" soon overcame such advantages and has left us in the situation so clearly demonstrated by the "Tabulation of Test Results on Commercial Bond and Ledger Papers."

As originally arranged, a good deal of study was required to see the significance of these results, and tables have been rearranged for the convenience of students of the situation, with certain omissions of data not essential to the purpose of this paper. So far as composition of the paper is concerned, only the percentage of rag or sulphite is shown, and where the percentage is given of one of these raw materials, the balance of the furnish is of the other; in other words, a paper shown as containing 45 per cent. rag would contain 55 per cent. sulphite.

The nominal weight of the papers tested was basis 17 x 22-20, but the actual weight of the samples tested is shown, together with the bursting strength, tensile strength, stretch, folding number and tearing number.

Tests Scientifically Carried Out.

It should be very clearly borne in mind that these tests are carried out in a scientific manner as outlined below, and that the crude methods of testing generally in vogue are of little value in arriving at safe conclusions. Papermakers will be quite justified in declining to make papers to specifications without the assurance that any testing of the paper so made would be carried out in conformity with scientific principles. The practice as observed in the Government Testing Section is as follows:—

All physical tests were made at 70° F. temperature, and 50 per cent. relative humidity. All samples from the same mill had been given a letter or letters, which appeared in the percentages after the serial number.

All microscopic determinations of fibre content were made by the "Count" method.

Chemical wood pulp cooked by the sulphite process is reported sulphite.

Chemical wood pulp cooked by the soda process is reported soda.

For *tensile strength*, *stretch*, and *folding endurance*, the terms "machine" and "across" refer to the *direction in which the test strips were cut.*

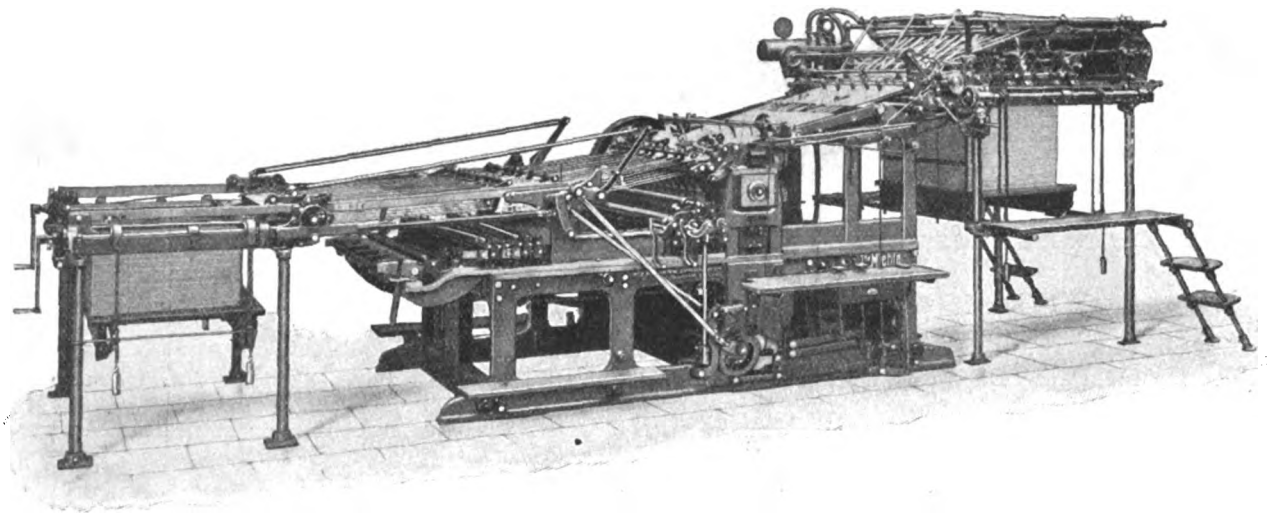
For *tearing resistance* test, the terms "machine" and "across" refer to the *direction in which the paper was torn.* Four sheets were torn simultaneously.

Strips for tensile strength, stretch, and folding endurance were cut 15 mm. in width. (Length for tensile strength and stretch was 100 mm. between jaws of machine.)

Folding endurance tension was 1,000 grammes.

The tabulation of the test results illustrated the condition that the writer has pointed out before, namely, that the word "standardisation" as commonly used in the paper trade has absolutely no significance except as applied to the product of individual mills. There are no definite standards of quality recognised by the paper trade as a whole.

The above figures show that of 14 different papers, all made of 100 per cent. sulphite, there is a variation in bursting strength from 14.5 to 36. In tensile strength from 4.4 to 9.9 (strips cut in machine direction), and 2.4 to 4.7 (strips cut across the grain). In folding strength, strips cut with the grain show a variation of from 7 to 265 folds before breaking, and strips cut across the grain from 3 to 287 folds. The variation in tearing strength was 19 to 49 torn in the "machine direction" and 25 to 64 torn across the grain. It is obvious from the above that one must know considerably more than the fibre content of a paper before judging of its quality. The different results in papers made from the same raw material afford a most striking proof of the importance of the human element and the part it plays in papermaking.



In Table No. 2 the papers having a rag content of 45 to 55 per cent. with the balance sulphite were segregated from the mass and show the following results:—

Only papers composed of 100 per cent. rag

The Miehle

WITH J&M AUTOMATIC PILE FEEDER AND PILE DELIVERY

The Miehle can now be supplied, as here illustrated, complete with the J&M Pile Suction Feeder (with sheet-turning arrangement for perfecting) and Pile Delivery. Full particulars of these additional units will be supplied on application.

An important feature of the Feeder is an arrangement whereby it is unnecessary to disturb the pile of sheets when printing the reverse side. To feed the sheets and turn them over, the pile is put into the Feeder with the leading edge towards the outer feed roll. By this means the sheets are automatically reversed and come down on to the feed board the right way up. Thus there is no re-piling or turning over of sheets by hand, or re-piling or turning of the sheets when working a second or third colour on either side.

It is suction fed, the pumps for creating the vacuum for the suckers and the compressed air for the blowers being of the rotary type, driven by a small independent motor. Each sucker head carries two suction arrangements, two blower arrangements, and two sheet grips. A sucker head is also carried on the control for the height of the pile.

This Feeder, which is carefully designed and well constructed, is provided with safety devices which include multiple-sheet and no-sheet trips. The pile is automatically controlled, so that it is kept always at the right height for feeding.

The Pile Delivery deposits sheets clear of the machine, printed side up or down, on to a board or truck which automatically adjusts itself to the correct level throughout the run. The sheets as they fall on to the Delivery are automatically knocked up and keep the pile even on all sides. A blade is supplied for fitting over the centre of the board or truck for dividing slit sheets. Special provision is made for preventing the sheets from curling on their passage down the delivery tapes. The delivery can quickly be altered from face-up to face-down, or vice versa. Trucks for the removal of the pile can be wheeled in from both sides of the delivery.

The Miehle, the J&M Pile Feeder, and Pile Delivery are manufactured by

LINOTYPE & MACHINERY LTD., 9 KINGSWAY, W.C.2

THE PAPER TRADE PROTECTION ASSOCIATION

Branch of THE BRITISH MERCANTILE AGENCY, LIMITED.

Directors: ALBERT WILLMOTT. A. GRANVILLE WHITE.

Trade Advisory Committee:

stock are shown, with the result below :—

As a matter of interest, the following tables have been prepared showing the average test for the five best papers in each of the three classifications as follows :—

100% SULPHITE BOND.

Bursting strength	31.68	
	Machine	Across
Tensile strength	8.58	3.85
Stretch	1.85	3.56
Folding	169.	106.5
Tearing	44.2	56.2

Rag Content, 45 to 55.

Bursting strength	42.2	
	Machine	Across
Tensile strength	9.1	4.98
Stretch	2.58	4.72
Folding	258.2	214.4
Tearing	53.4	59.4

100% Rag.

Bursting strength	64.1	
	Machine	Across
Tensile strength	11.16	7.18
Stretch	4.56	6.9
Folding	1848.	1873.4
Tearing	79.6	86.4

It has not seemed necessary to work out tables for grades that might be intermediate between 100 per cent. sulphite and 45 per cent. to 55 per cent. rag, or between 45 per cent. and 55 per cent. rag and 100 per cent. rag, but a comparison between the following two papers, one of 25 per cent. rag and 75 per cent. rag is interesting, and the result should be compared with the averages of the other three tables.

It is interesting to note that neither of these papers is appreciably better in the light of these tests than the best 100 per cent. sulphite paper, although the 75 per cent. rag paper shows a somewhat better result than the average of the five better 100 per cent. sulphite bond papers.

The Government Printing Office is content to have standardised on the use of three grades, but for commercial purposes it might be well to add a few others. Does it seem reasonable, for example, to have two grades of sulphite bond and one rag content paper graded between the sulphite and the 50 per cent. rag, and another between the 50 per cent. and 100 per cent. rag content? These matters may better be left to the various manufacturers, if any action whatsoever is to be taken. The writer appreciates that many of the manufacturers have very decided views on the subject of standardisation, and many honest misgivings about its advantages.

100% SULPHITE BOND PAPERS.

Trade Notes.

THE Director-General, India Store Department, Branch No. 10, Belvedere-road, Lambeth, S.E.1, invites tenders for, amongst other things, a rotary post card printing machine and a printing machine, quad crown, two colour. Tender forms are obtainable on application at the above address.

THE *People*, the Sunday newspaper, has been taken over by a new company controlled by Odhams Press, Ltd. It was founded in 1881 as a democratic Conservative organ by Sir William Madge, the late Sir George Armstrong and others. In 1913 Sir William Madge and his family became the sole proprietors. In an interview, Mr. J. S. Elias, managing director of Odhams Press, stated that his firm were taking control from the next issue. He had no intention of changing its policy.

A STRIKE took place on Saturday at the office of the *People* and lasted about three hours. It arose from the fact that the paper is changing hands and those members of the staff who are being replaced declared that they had not received the proper notice or compensation. Shortly after noon two clerks struck work, the packers struck in support, and the journalists, union men and non-unionists followed suit. Work was later resumed on the intervention of the National Union of Journalists.

OWING to the fact that the Amalgamated Society of Lithographers issued instructions that their members working on flat bed offset machines should demand additional rates of wages, a meeting of the J.I C. Conciliation Committee, which had previously considered the matter, was held on Tuesday last, and a conference took place between representatives of the union and the employers. The result is to be reported to the executive committees of both parties.

THE London District Committee of the Joint Industrial Council is to hold a special meeting on Monday next to consider a dispute that has arisen between the Paper Workers' Union and the distributing department of a London catering firm.

THE Organisation Committee of the Joint Industrial Council will meet on Tuesday, the 10th instant, when reports will be received from District Committees throughout the country, and arrangements will be made for the National Convention of the Joint Industrial Council, which is to be held at the Printing Exhibition, London, on May 20th.

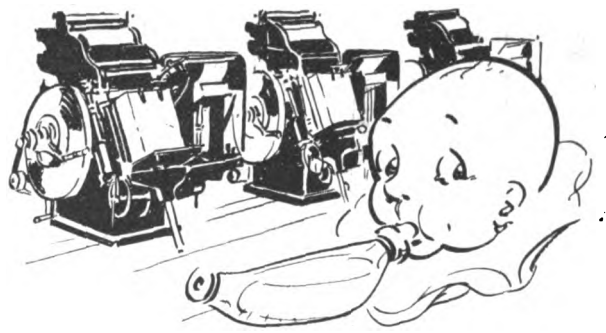
STATIONERY OFFICE ESTIMATE.—The Stationery Office estimate for 1925-6 for stationery and printing is given as £1,563,800. This is an increase of £70,119 over the figure for 1924-5, or an increase of 4·8 per cent. The total figure, according to the *Star* is equal to an expenditure of £3 a minute during the year, and the same writer suggests that an immediate explanation is called for.

THE annual dinner and concert of the Cycling Section of Messrs. Newnes and Pearson Sports' Club took place on Saturday at the "Old Bell," Holborn, under the chairmanship of Mr. Frank Honour, overseer of the machine department. The company numbering about ninety, enjoyed the presentation of a capital musical programme.

CONTINENTAL PRINTING AT BRISTOL.—Under the auspices of the District Committee of the Joint Industrial Council, the examples of Continental printing collected by Mr. J. R. Riddell during his recent visit to the Continental printing centres were on exhibition at Bristol last week. On Thursday, February 26th, Mr. Riddell went to Bristol, and gave an interesting account of his journeyings and what he saw during his 2,000 miles tour. Over 300 printers gathered in the large hall of the Merchant Venturers' College to hear the address. Keen interest was taken in the exhibition, and many pointed questions were asked at the close of the lecture.

EXHIBITION OF BRITISH PRINTING.—Arising out of the recent exhibition of printing done on the Continent which was held at the London School of Printing at Christmas, the principal, Mr. Riddell, is arranging an exhibition of British printing at the School at Easter, for the purpose of showing that printing at least equal to that done on the Continent is produced in this country. This will provide a good opportunity for comparison between home and foreign productions.

MR. ROBERT J. WEBBER, chairman of the Federation of Southern Newspaper Owners, on Tuesday entertained the members to luncheon at the Constitutional Club, to meet the president of the Newspaper Society, Mr. W. Astle, of Stockport.



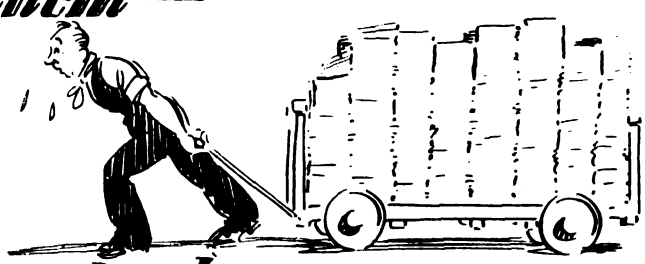
THE North Wales Master Printers' Alliance is holding a special rally at Chester on Monday, the 9th instant, when the president of the Federation and visitors from adjoining Alliances will be present to discuss trade matters.

THE latest book of samples of bookbinding cloths by Messrs. Bentley Smith and Co., Ltd., of 2, King Edward-street, London, E.C.1, shows examples of their "Coveroid" brand of cloths. These are imitation leathers and show a good range of varieties and some very clever imitations in a grade of fabric which has features that make a strong appeal to bookbinders.

Trade Union Matters.

L.S.C. ELECTIONS.—Keenly contested elections for office in the London Society of Compositors resulted as follows: Executive Committee—(Case Department) Messrs. H. F. Wagdin, A. Lucas, C. A. Blackwell, W. F. Edgerton, W. Harrison, A. Littlejohn, G. Swaffield, C. Dee and E. W. Franklin; (Reading Department), L. J. Mooney; (Linotype Department), J. O. Hatcher; (Monotype Department), C. Hart; London Trades Council—Messrs. A. P. Payne, C. Wood, H. R. Holmes, A. M. Wall, S. Fox, W. F. France, A. Allen, W. A. Davies, G. Lane and G. Wales; London Printing Trades Federation — Messrs. H. J. Willis, H. A. Cannon, J. Jackson, C. A. Bennett and C. H. Shock; National Printing Trades Federation—Messrs. R. W. Couchman, C. G. West, R. H. Lucas and H. Deuvall; Trades Union Congress—Messrs T. Timberlake and F. Lemaire; General Federation of Trade Unions—Mr. A. Petrie; Joint Industrial Council (London Committee)—Messrs. A. V. Coombs and A. Fox. The ballot for five vacant seats on the News Committee resulted in the election of Messrs. J. Syred, F. J. Mayer, G. A. Buttery, W. A. Rodford, and F. Lemaire.

HEIDELBERG AUTOMATICS *are so simple*



Advantages

THE Heidelberg will take all papers from tissue to manilla with minimum of adjustment. Equally good for long or short runs. It will print envelopes, wages bags, etc., two on. No feeders required. One operator can control two machines (the Trade Union Authorities have agreed to this)

The Heidelberg stops of its own accord when the desired job is finished, or paper feed emptied. It is amazingly simple, moreover it is foolproof. The problems of large output, small labour charges and moderate initial outlay are solved with the Heidelberg Automatic

Fitted for drive by both shafting and electric motor, power required ¾ H.P. Weight about a ton packed.

any young feeder can control them —

but it takes a strong man to remove the output—!

All information on request.
Demonstrations arranged.

Price : £185 ERECTED, LEFT RUNNING, COMPLETE.
DEFERRED PAYMENTS ARRANGED.

Printers' Managers and Overseers ASSOCIATION.

MANCHESTER AND DISTRICT CENTRE
Annual Dinner.

A longing to fraternise with trade brethren and a desire to honour the ex-president brought together between eighty and ninety members of the Manchester Centre, P.M. and O.A., and their friends—ladies and gentlemen—in the Mitre Hotel, Cathedral Gates, Manchester, on February 21st, it being the evening for the annual dinner. Mr. Frank Scouler (president) and Mr. Albert Hellewell (vice-president), Manchester Centre, had the support of: Parent Centre—Mr. R. H. Berry (president), Mr. E. W. Whittle (general secretary), Mrs. R. H. Berry; Liverpool—Mr. W. E. Wall (president), Mr. J. N. Poole (secretary), Mr. Chas. Mackie (ex-president), Mr. Thos. Rignall, Mrs. W. E. Wall, Mrs. Jas. N. Poole, Mrs. Chas. Mackie; Yorkshire—Mr. A. L. Hamer (president), Mr. H. O. Pattinson (secretary); Printing Crafts Guild—Mr. John Taylor (president) and Mrs. John Taylor; also Mrs. F. Scouler, Mrs. A. Hellewell, Mr. and Mrs. W. S. Whittaker, Mr. and Mrs. Edward McVay, Mr. and Mrs. J. H. Nuttall, Mr. and Mrs. J. E. Mayo, Miss Pattie Mayo, Mr. and Mrs. J. Ball, Mr. and Mrs. E. C. Balls, Mr. W. Bardsley, Mr. A. J. Gyngell, Miss Gyngell, Mr. and Mrs. R. W. Hughes, Mr. J. W. Philbin, Mr. and Mrs. Geo. H. Rider, Miss Rider, Mr. F. E. Robinson (ex-president), Mrs. F. E. Robinson, Mr. and Mrs. E. Garrett, Mr. and Mrs. A. Bartlett, Mr. and Mrs. H. Clark, Mr. and Mrs. J. H. Clarkson, Mr. W. H. Connah, Mr. J. Eddie, Mr. and Mrs. A. Gavin, Mr J. E. Howarth, Mr. and Mrs. Albert Jones, Mr. Ervine Law, Mr. and Mrs. W. Smith, Mr. and Mrs. J. Wadsworth, Mr. and Mrs. J. Winstanley, Mr. R. Hall, Mr. and Mrs. Cooper, Mr. and Mrs. Chas. Rogers, Mr. Reginald Rogers, Mr. Garner, Mrs. Twitty, and Mr. F. J. Hughes (secretary). Punctually at six o'clock Mr. E. Garrett (tyler) announced separately those who had come to dine and passed them on to President Scouler and Mrs. Scouler, who gave them a hearty welcome.

Grace being said, the feast began, and as appetites waned, hilarity came uppermost until the announcement of the toast, "The King," given by the president, brought all immediately to attention. This being honoured, the removal of the cloth, and a pianoforte solo by Mr. Harold Creech, brought the second toast, "The P.M. and O.A."

This was in the capable hands of Mr. J. H. Nuttall, who asked, "What does it stand for?' He said it stood for everything appertaining to the well being of every member. Every wife ought to make a special effort each month to see that her husband attended the meetings of the Centre, where he would receive a hearty handshake and realise good friendship, which would soothe his sorrows, heal his wounds, and drive away his fears. He who had not found the Association was an isolated individual who daily went home from business with the impression that no one cared for him, whereas by coming out of himself and getting linked up he would be able to add to his knowledge, to his position, to his standing in the craft, and to that part of life which would stimulate him to further progress. Although situated in a difficult position financially, the Council of the Manchester Centre endeavoured to go forward on economical lines, yet maintaining the dignity of the Association.

Mr. R. H. Berry (London) acknowledged this toast, and in the course of his remarks said it was the duty of the parent to keep in order any of its unruly offspring, but he was glad to say they of the P.M. and O.A. were all a happy family. Manchester Centre would be celebrating its twenty first birthday at the end of the year, whilst Liverpool would shortly be doing the same. Yorkshire had reached the century, whilst Manchester and Liverpool stood somewhere about eighty-eight. He hoped the friendly Battle of the Roses would continue. London naturally controlled to a large extent the forces of the Association, yet looked for unity amongst all the Centres in order to move along successfully. In may next the United Gathering and Conference would be held in London during the period of the Printing Exhibition; therefore, he asked all present that evening to pass on the good news and at the same time make an effort themselves to visit the Exhibition, as arrangements had been made for several hundred people.

Mr. W. E. Wall (Liverpool) said there was an open invitation for all to be at Liverpool on the 9th of May next to join with them in celebrating their twenty-first birthday and honouring Mr. Jas. N. Poole, who had been their secretary for the whole period.

Mr. A. L. Hamer (Yorkshire) said it was always a pleasure to attend the Manchester Centre, as he received a warm welcome on each occasion. He would remind them that Yorkshire had recently obtained its hundredth member and was doing its best to make progress. He did not know how London fared, but, taking the Provincial Centres as a whole, they had not advanced as they might have done. Every member should be a missionary. The friendly fight for the Seeley Cup had brought Liverpool, Manchester and Yorkshire together more often, and such inter-visits helped to spread the bond of friendship. He would like to see other Centres enter the field as the day was always an enjoyable one for Yorkshire.

Mr. Jas. N. Poole (Liverpool) enlightened some of the Manchester members respecting their birth in the Grotto Cafe, an ancient institution which has had to make room for modern requirements.

Presentation to Mr. Frederick E. Robinson.

Mr. Frank Scouler (president) said Mr. Robinson had always been willing to give advice and help for the benefit of members and their wives, and when the members heard of his success in becoming a master printer, they decided to show their appreciation in some tangible form. Later on, news travelled to Liverpool and they expressed a wish to join because friend Robinson had done so much to increase the unity of the two Centres. In asking Mr. Robinson to accept a present of a timepiece with two accompanying figures, he hoped that Mrs. Robinson would look at them when he was late at a meeting and feel comfortable knowing that he was in good company.

The inscription on the timepiece is as follows:—"Presented to Frederick E. Robinson, president of the P. M. and O. A., Manchester and District Centre, 1922–1924, in appreciation of his honourable service. February 21st, 1925." The two figures accompanying same represent "Inspiration" and "Harmony."

Mr. R. H. Berry (London) said Mr. Robinson was not unknown to them in the metropolis. Manchester had robbed them of his membership, so what had been London's loss had been a gain to the North. Had he stayed in the City he would have won such favour that the position of president of the Association would have been offered him.

Mr. E. W. Whittle (London) said he believed the motto of the ex-president was, "I serve," and he had done his best during his term of office. They did not forget Mrs. Robinson, who stayed at home whilst her husband was out on the Association's business, and her help had been invaluable in the sense of Milton, who wrote, "They also serve who only stand and wait."

Mr. W. E. Wall (Liverpool) remarked that they had always a warm corner for Manchester's ex-president, and they were glad of the privilege of adding to the testimonial.

Mr. Jas. N. Poole (Liverpool) supported by saying the recipient had many chances of cementing more closely the two centres—Manchester and Liverpool—and, what was more, he had never failed to grasp those opportunities whenever they were within his reach. Mr. Robinson was one of the finest members the Manchester Centre had ever placed in the presidential chair.

Mr. A. L. Hamer (Yorkshire) desired to add his testimony, as Mr. Robinson had made many friends in their Centre, and he congratulated Manchaster on having such a stalwart in its ranks.

Mr. John Taylor (Manchester) was pleased to hear that such a good worker had received some recognition for what he had done on behalf of the Association.

Mr. W. S. Whittaker (co-partner) reminded his listeners that twelve months ago, when toasting the chairman for that evening, he stated that "Mr. Robinson was a white man," and he had no reason to change his mind that evening. It was a pleasure to find good honest effort rewarded.

There was great acclamation when Mr. Robinson arose to return thanks. He said that words failed him to give adequate expression to his feelings in respect of the beautiful gift that was before him. He would not say he had done more than any other president, as he had only done his duty. When he took up office he did not anticipate doing better than those of his predecessors who had passed through the chair of the Centre. Their work had been worthy of emulation and he desired to pay them such a compliment. That being so, he said to himself, "How best can I serve the Association?" and he set about bringing the Centres closer together, particularly Liverpool, and it had proved justifiable on account of the many times he had been in their company. Liverpool had always treated him in a very kind manner, and as Manchester and Liverpool were two Lancashire Centres, they should pull together. If there were any claims he could make, they were only two, firstly, in being sincere to the Centre, and secondly, in being loyal to the Association. When the members appointed him as their president, they little thought they were placing him in a position whereby he obtained something that was a great asset. He had visited other Centres and made a large number of friends and if anyone owed anything, it was himself to the Association. He felt proud in accepting the gilt, and it would be a reminder of the many friends he had made since he joined the Association. (Applause.)

Probably the only one to do justice to the toast of "The Visitors, the Ladies and the Artistes," was Mr. Edward McVay who waxed eloquent in his welcome to the visitors, both ladies and gentlemen, and in his appreciation of the artistes.

Those who responded were Mr. John Taylor, Mr. W. S. Whittaker, and General Secretary Whittle who congratulated Messrs. Whittaker and Robinson on the excellent souvenir programme they had presented to the Centre.

We are in harmony with Mr. McVay who said he could not specify any artiste as they all had done so well. Their names were: Mr. Arthur Farrer, Miss Annie Briggs, Mr. Harry Brannigan, Miss Jane Handford. The accompanists were Mr. Cecil Robinson and Mr. Harold Creech.

Thanks are due to Messrs. J. H. Nuttall, A. Hellewell (musical directors), Mrs. E. Garrett and Mrs. Jas. E. Mayo (lady stewards), Mr. Jas. E. Mayo (treasurer), and Mr. E. Garrett (tyler).

A vote of thanks to the chairman was heartily supported, the singing of "Auld Lang Syne" and "God save the King" concluding another evening thoroughly enjoyed by the members, their good ladies and their friends.

Newspaper Press Fund.

The annual meeting of the Newspaper Press Fund was held on Saturday at the offices of the Fund, 11, Garrick-street, W.C.

Viscount Burnham, the president, was in the chair, and in the course of his speech said the accounts demonstrated what a solid benefit and advantage the fund was to the members of the profession.

Mr. W. Thornton Sharp, the treasurer, said the membership roll of the fund was 3,382, a slight decrease compared with the previous year. The total receipts, leaving out the balance for the previous year, were £17,000, and the expenditure was £15,000, showing only £2,000 margin.

The appointment of Mr. A. W. Simmons, Mr. F. R. Huxtable, and Mr. W. G. Bell to fill vacancies that had occurred on the council in the past year was confirmed.

An election to fill six vacancies on the council caused by members retiring in rotation took place the same day, the result being announced later as follows: P. B. M. Roberts, 1,118; Walter G. Bell, 1,080; Gordon Robbins, 1,039; Walter Curtis, 1,035; Robert Gray, 1,028; T. McD. Rendle, 995. The foregoing were elected. H. M. Richardson (not elected), 657.

ADMINISTRATIVE COUNTY OF LONDON.

School of Photo-Engraving & Lithography

BOLT COURT, FLEET ST., E.C.4.

Lectures on Photo-Engraving Methods: by A. J. Bull, M.Sc.

These lectures are descriptive of modern methods of producing illustrations and are intended for printers, advertisers, and commercial artists, and others to whom a knowledge of the capabilities of the various processes is of value.

Lectures commence on THURSDAY, 5th MARCH, 1925, at 7 p.m. Syllabus on application.

Fee for the term, 5/-, for those resident within the Administrative Counties of London & Middlesex. Special fees for out county students.

The entrance to Bolt Court is between 151 and 152, Fleet Street.

Improved British Printing.

IT must seem to most of us that it was in the dark ages of the past that printers, when they strove to be "artistic," had recourse to a fearful and wonderful mixing of fantastic faces of type, helped out by even more fantastic rules and "ornaments." Yet, according to the calendar, that time is not far distant, and but a comparatively few years have seen the printing trade as a whole make immense strides in the direction of simpler, purer style and that "fitness for purpose" of which idealists have preached. It helps us all if we can pat ourselves on the back occasionally and make a note of progress being made, so we pass on to our readers a few sentences which appeared the other day in the *Manchester Guardian*, and which gave rise to the above observations. "In the main," says the writer, "printing in this country is steadily improving, and there is more appreciation of the value of good printing. Not so long ago booklets and catalogues issued by firms of repute were creditable neither to the firms nor to the printers. They appeared to be a combination of waste paper, poor ink, and straggling type. To-day many of these brochures are works of art, examined for the pleasure given to the eye and afterwards read because the story told—generally written in an interesting way—is in clear and dignified type, enhancing the first impression. Publications of that kind repay all responsible for their production." Then, letting his mind turn from the printed result to the mechanical means of its production, the writer adds, as a wise afterthought: "The composition of the metals used has a big say in the final results, and the best of metals are based on expert laboratory work. Metal manufacturers are consequently entitled to some share in the success of British printing."

* * *

Occupational Distribution.

A MINISTRY OF HEALTH Blue Book of industry tables, based on the census of England and Wales in 1921, and issued by the Stationery Office, affords some interesting side-lights for those who care to investigate figures. The returns show 17,178,050 persons engaged in industry in England and Wales out of a total population of 37,886,699. Of 18,075,239 males 12,112,718 and of 19,811,460 females 5,065,332 were employed in one occupation or another. The first table gives the occupational distribution per thousand engaged and the summarised figures for England and Wales show the arresting fact that fewer than 50 per cent., the actual figure being 489 in every 1,000, were engaged in production, repair and maintenance. In papermaking, stationery and stationery requisites, printing, bookbinding, photography, the total number of persons engaged was 356,808, while the occupational distribution per thousand was as follows: Production, repair and maintenance, 734; transport and communication, 37; commerce and finance (excluding clerical staff), 32; professional, 26; domestic, 7; draughtsmen and clerical staff, 86; warehousemen, storekeepers and packers, 44; stationary engine drivers, etc., 7; others (mainly labourers), 27. All of which goes to show how much subsidiary employment springs from productive industry.

* * *

Raw Material for Paper.

IT may not be generally known that next to U.S.A., Sweden is the largest producer of wood pulp in the world. According to official figures, Sweden produces 25 per cent. of all the mechanical pulp in international commerce and more than 50 per cent. of chemical wood pulp. Practically one half of Sweden's total export is accounted for by pulp and paper and their products.

Charivari Social Club.

A large and appreciative audience filled the King George's Hall, Tottenham-court-road, on Thursday last, February 26th, when the members of the dramatic section of the Charivari Social Club gave a performance of "Mr. Pim Passes By," the well known comedy by Mr. A. A. Milne, who was sub-editor of *Punch* from 1906 to 1915. This was the first occasion on which the members had attempted anything in the nature of amateur theatricals, and it was unanimously voted by members as well as by the large number of visitors present to be a great success.

Mr. Ewan Agnew (the founder of the Club and producer of the play) was the outstanding figure in the part of George Marden, J.P., and his elocution and acting were of the best. Miss Henriette Mooney as Olivia (George Marden's wife) the most difficult part in the play, was very pleasing and showed great confidence in her work. Miss Doris Chalk as "Dinah" and Mr. James Stephens as "Brian Strange" made a most suitable couple of young lovers and both came through with honours. Miss Chalk has ability out of the ordinary and gained full measure of applause for her performance. Mr. Alfred White in his quaint style caused much laughter as "Carraway Pim." Miss Winifred Townson, as "Lady Marden," had one good opportunity and took it in full measure, and Miss Audrey Allen played prettily in the small part of "Anne," the maid.

Before the final fall of the curtain, and in answer to repeated applause, Mr. Ewan Agnew came forward and spoke a few words of thanks for the manner in which the audience had appreciated their efforts and for their indulgence and kindness. It was a great thing to know they could produce a play like this by their own people, and without outside help.

The Club has its headquarters at the *Punch* offices, 10, Bouverie-street, and its members comprise the entire staff of the employees of the firm of Messrs. Bradbury, Agnew and Co., Ltd., the proprietors, who have taken the deepest interest in the activities of the Club since its formation some twelve months ago. Its objects are to promote and encourage social intercourse and fellowship throughout all departments—both staff and mechanical, and it is pleasing to learn that it is doing good work.

Personal.

Mr. E. George Arnold, LL.D., past president of the Federation of Master Printers, was honoured on Monday at a complimentary lunch given in the Masonic Hall, Leeds, by the Leeds and District Master Printers' Association, followed by the presentation of an illuminated address of congratulation on the honour of Doctor of Laws being conferred on him by the University of Leeds.

The presentation was made by Mr. J. A. Stembridge, chairman of the Association, who enumerated the many phases of public work in which Mr. Arnold was engaged. Mr. Henry Jenkinson, a past president, and Mr. A. Wigley, vice president of the Association, supported the chairman.

Mr. R. Ackrill Breare, managing director of Messrs. R. Ackrill, Ltd., printers and newspaper proprietors, Harrogate, has been elected a life governor of the Harrogate Infirmary in recognition of his work for that institution.

Mr. H. C. Bolton (of Messrs. Lorilleux and Bolton, Ltd.), has again accepted the presidency of the Camden Town Printers' Philanthropic Society, an auxiliary of the Printers' Pension Corporation.

Mr. Bolton is to preside at a concert to be held on Saturday next, March 7th, at the Royal Arms, Gaisford-street, Kentish Town, N.W.5, and is appealing to the trade for assistance in materially augmenting this year's funds.

Mr. C. L. Stern (of Linotype and Machinery Limited), is to lecture on Saturday next at the College of Technology, Manchester, under the auspices of the Printing Crafts Guild. The lecture, which will be illustrated by lantern, is on "Printing Machinery."

Mr. J. H. R. Renwich, chairman of directors of Messrs. William Walker and Sons, the largest printing and publishing concern in the Wharfedale district of Yorkshire, has been selected to oppose the Socialist candidate in the Otley Division at the coming election for the West Riding County Council.

Mr. Renwich was a few days ago elected president of the Bradford Master Printers' Association, and represents that body on the Yorkshire Alliance and also on the Federation of Master Printers.

Mr. A. Langley (president of the L.M.P.A.) and Mr. F. R. Muir (vice-president) attended a successful whist drive held at Clapham Junction by the South-West London Master Printers' Association. Mr. and Mrs. Simnett received the visitors.

Mr. E. H. Berryman entertained the Printers' Managers and Overseers (Parent) Association on Tuesday evening with a lecture on "Songs and Singers of the 'Sixties," illustrated by violin and pianoforte music.

Mr. W. M. Forsyth, foundry manager of Messrs. Cassell's and a prominent member of the Electrotypers' and Electrotypers Managers and Overseers Association, is making satisfactory progress from a recent operation and expects to leave Willesden Hospital in a few days.

Mr. Frank Colebrook gave a lecture on Friday at the Technical College, Derby, taking as the subject of his address the work of Charles Knight. The meeting was a well-attended one, and the value of the lecture was enhanced by a display of several specimens of the work of the early pioneer of popular literature. Mr. J. H. Simpson, chairman of the Derbyshire Master Printers' Association, presided over the gathering.

Mr. Colebrook also fulfilled an engagement on Tuesday at St. Bride Institute, when he addressed the members of the Printing, Bookbinding and Kindred Trades Overseers' Association, delivering an interesting lecture on the "Life Work of William Blades."

Mr. W. J. Mizen (hon. secretary of the North London Master Printers' Association), who is touring the Mediterranean, is enjoying good weather, though not so warm as might be wished. His itinerary has already included Lisbon, Tangier, Palma and Barcelona, with a visit to Nice during the carnival.

Mr. Henny Hay, of Messrs. T. Nelson and Sons, Ltd., delivered a lantern lecture to the Edinburgh Typographia in the Heriot-Watt College on Wednesday of last week on the subject of "The Making of the Process Block."

Mr. Fred J. Melville, who lectured on "Stamp Printing" at the February meeting of the London Central Districts Master Printers' Association, was on Wednesday of last week the guest of honour at a largely attended dinner given at the Holborn Restaurant by philatelists in recognition of his services to philately.

From the London Gazette.

PARTNERSHIPS DISSOLVED.

W. H. Harrison and J. W. Taylor, printers, 32, Clayton-street West, Newcastle-upon-Tyne, under the style of Harrison and Taylor.

F. W. Carter and S. H. Carter, stationers, 163, Western-road, Brighton, under the style of Carter Bros.

Veronica H. E. D. R. Isaacson and S. F. Isaacson, paper importers and merchants, at Trig-land, 34, Upper Thames street, London, under the style of E. Becker.

BANKRUPTCY ACT, 1914.

RECEIVING ORDER.

W. Evans, residing at 22, Etruria-street, Stockport-road, Manchester, and carrying on business with another under the style of the Shakespeare Press, 37, Little Peter-street, Gaythorn, Manchester, printer.

The more valued friends you have the greater chance you have to win.

Employment in Allied Trades.

Employment in the paper trade in January, while moderate on the whole, showed a slight improvement on the previous month. Employment was intermittent or accompanied by short time in some districts, particularly in the brown and wrapping paper sections; in other districts a resumption of full time was reported.

With letterpress printers employment, generally, continued fairly good; in some centres, however, including Leeds, Edinburgh and Glasgow, it was slightly worse than in December. Employment continued good with electrotypers and stereotypers, and an improvement was reported in London.

With lithographic printers employment, generally, was fair; it showed a decline as compared with the previous month at Manchester and Edinburgh. Employment with lithographic artists in London and Manchester was fair and moderate respectively, the latter town showing a decline.

In the bookbinding trade employment, on the whole, was moderate and worse than during December; short time was prevalent in London and Edinburgh.

The percentage of unemployed among workpeople covered by the Unemployment Insurance Acts in the printing and bookbinding trades was 5·9 at January 26th, compared with 5·0 at December 22nd, 1924, and 6·4 at January 28th, 1924. In the paper and paperboard-making industry the percentage was 7·5 at January 26th, compared with 7·7 at December 22nd, 1924, and 13·6 at January 28th, 1924. In the cardboard box, paper bag and stationery trades the percentage was 7·9 at January 26th, compared with 6·4 at December 22nd, 1924, and 7·9 at January 28th, 1924.

The Bookbinder

Time Dockets in the Bindery.

Mass Meeting in Manchester.

Some little difficulty having arisen in Manchester in respect of the filling up of time dockets by bookbinding workers, it was arranged (as we previously announced) to hold a mass meeting of bindery workers to be addressed on the subject by Mr. A. E. Goodwin, secretary of the Federation of Master Printers. This meeting was duly held on Friday evening last, and the Caxton Hall, Manchester, was filled to its utmost capacity with members of the National Union of Printing, Bookbinding, Machine Rulers and Paper Workers.

The chairman of the Manchester branch of the Union was supported by the secretary and other members of the branch executive, and there were also present Mr. G. Harroway, president of the Union, Mr. H. Bethell, president of the Manchester and Salford Master Printers' Association, Mr. W. G. White, secretary of the Lancashire and Cheshire Alliance, Mr. A. D. Hull, cost accountant of the Federation of Master Printers, and Mr. Dickson, assistant secretary of the Manchester and Salford M.P.A.

At the opening of the proceedings it was intimated that the meeting was a private one, and that no notes should be taken of any observations by members of the Union; but no exception was taken to the reporting of any statements made by representatives of the employers.

Mr. Bethell explained the local position, and pointed out that difficulties were not being raised in any other centre in regard to the filling up of time sheets in the way the employers required. He emphasised the point that the prosperity of the binding industry in Manchester depended upon the whole industry working together amicably, and that the employers needed the goodwill of the workpeople to ensure the success of their businesses. He referred to several instances of co operation between the trade unions and the employers, particularly in connection with the local technical college, and recalled also that the first social gathering of the local District Committee of the J.I.C., held the previous week, had been an outstanding success.

The Purpose of Costing.

After a few questions had been asked and answered, Mr. A. E. Goodwin was called upon to speak, and, after a few introductory remarks, he proceeded first to explain briefly why the Costing Campaign was started at all. In 1910-11, he said—15 years ago—there was a general feeling in the printing and binding industry that neither the employers nor the employed were getting a satisfactory return for their efforts. Those present who could carry their minds back to those days would be prepared to agree that this was so as regards the workpeople. The employers, at any rate—who had to provide buildings, machinery, and the staff to secure orders and see to their execution — were quite convinced. Many ideas were considered, but finally there was general agreement that a good deal of printing and binding work was being sold below the actual cost of production. This was not good for either masters or men. They also came to the conclusion that this was largely due to ignorance—ignorance and faulty estimating. So a system was devised, of a simple yet scientific character, whereby the employers could more accurately ascertain their costs, and for 12 years efforts had been made to get employers to adopt the methods recommended.

Proceeding, Mr. Goodwin said he need not trouble them with too many details, but there were two essentials in ascertaining cost: it was necessary to know the general expenses of the business, and to apportion these to the various sections or departments; and it was also necessary to know that all the time paid for was being properly charged to one order or another, and that no time at all was missed out.

Necessity for Time Sheets.

If an employer bought materials he naturally wanted to keep records of how those materials were used. Similarly, in respect of labour, he wanted to see that it was all charged against the orders that it came in—and no man or woman would like to think that the work he was doing should not be paid for by the customer. Employers and employees all had a common interest in seeing that the binding industry was put on a sound basis. There was no logical argument to be put forward against the use of time sheets as such. In regard to the use of time sheets, agreement was reached with the trade unions excepting the binders, quite ten years ago. One of the objects of the J.I.C. was to maintain a fair standard of prices, and it was impossible to say what was a fair standard unless it was agreed what a job really cost, and the only standard by which this could be judged was the Costing System which the Joint Industrial Council had approved.

Over a year ago agreement was reached that time sheets should be used in the binding departments in Manchester, on an undertaking that they should be used for costing purposes only and that any complaints of their being used for any other purpose would be promptly investigated. Not a single case had been reported to the Manchester M.P.A., said Mr Goodwin, and he would go further and say that not a single case had been reported to him from any part of the country during the past five years. There appeared, however, to have been a slight misunderstanding on one point of detail, which they were all anxious to clear up. It was admitted that there were difficulties in using time sheets in the bookbinding department, difficulties which did not exist in other sections. He did not want to minimise these, but he asked that they should not be exaggerated. The fact could not be gainsaid that daily time sheets were being filled up in hundreds of bindery shops throughout the country, shops doing quite a variety of work.

Mr. Goodwin proceeded to explain how the Federation Costing System was worked. An order, he said, came in, and an order sheet was made out and at the same time a cost sheet. Some jobs might be finished in a day, others might go on for weeks or months; and the material used and the time worked must be kept track of somewhere. The best method was found from experience to be for the time worked on every job to be put down by the man himself. Then the time sheet came in to the office and the times were recorded on the cost sheet. Then when the job was completed—it didn't matter how long the job had been in the works, or how many men had worked on it, or how many departments it had passed through—they had a complete record of all time spent upon it.

The Difficulty of Batch Work.

The question had been asked a year ago, How about jobs done in batches? Here the misunderstanding had arisen. He had said that the difficulty was got over in several ways, according to the way in which work was arranged. If a group of books were put through together, and they passed through several hands, the time could be put down against the batch and allocated when completed to the different orders making up the batch. But to do this properly would make it necessary to have more details of time spent in the different processes. He had said, and he wished to emphasise it that evening, that the men who were actually handling the jobs were in a better position to allocate the time between different orders in a batch than anyone in the office. It could not be done to fractions of minutes, and no employer would be so foolish as to ask for this; but in the particular office which had brought this question to a head the men were doing for a year all that was needed—dividing their time each day as nearly as possible over the orders they had been working on. A time sheet which gave, say, six order numbers and said nine hours on these orders was of very little value.

Concluding, Mr. Goodwin said they wanted them all to see the purpose for which the information was required and to realise that the employers had the right to expect their men to help them to ascertain the actual cost, as far as this was practicable. The undertaking to investigate any case of time sheets being used for any other purpose than arriving at cost still held good. If there was any idea that any one complaining would endanger his position, that idea should be removed, for any genuine case brought forward would be helpful in proving that their union and the employers' organisation were able to see this undertaking carried out. He would be pleased to answer any questions, seeing that his one object was to clear the air and to persuade them that in this matter the interests of the workers and employers were identical, because better costing, leading to better estimating, would put the whole binding industry on a sounder foundation.

At the close of Mr. Goodwin's address, which was listened to with keen interest, questions were fired at the speaker from all parts of the hall, and all were answered in a good-humoured way, a friendly atmosphere prevailing.

The chairman then asked the employers' representatives to retire, and the members continued the discussion in private.

Notes and News.

Hopeful Trend of Trade.

Bookbinders are rather better placed as regards business in hand, but there still remains a large quota of unemployed labour to be absorbed. In the commercial section there is better inquiry from large consumers, and a gradual improvement in the number of miscellaneous orders. Naturally this should follow the spread of general trade. There is every reason to believe that the trade of the country is on the mend and according to the leaders of commerce and industry the prospects are brighter than they have been since the war. That being so, and granted fulfulment of optimistic predictions, we may shortly find the state of the country reflected in the consumption of day book and ledger space.

The Field for New Orders.

It has often been stated as the present writer's opinion that the future of stationery bookbinding as apart from loose-leaf binding is a doubtful proposition. More and more we see the loose-leaf gaining ground at the expense of bound books. Even in the bound books there are two distinct spheres, the one comprising better-class work and the other what is termed in the trade "tripe" work, *i.e.*, the cheap quarter-bound stock and scholastic. The tendency to specialise has caused binders to concentrate on one class of work more particularly and there are comparatively few establishments where every type of bookbinding can be effectively catered for. Thus there are the three fields from which work is sought, viz., the ordinary commercial, the cheap educational and the newer loose-leaf. There will always be room for development in the two last-named directions but it is very much to be doubted whether the bookbinder who is restricted to half and full bound sewn books will find it possible to discover many new sources of demand. In the early stages of loose-leaf mechanisms too little attention was paid to loose-leaf work by the bookbinding industry and even now with all the evidence of its hold on the market there is too little disposition to accept the facts. As we see it, the bookbinder who declines to consider the possibilities of developing a loose-leaf ledger department is resigning himself to an almost inevitable decline in turnover.

Banks and Loose-leaf Binding.

The final success and culminating achievement of mechanical binding will come when the leading banks discard bound ledgers for loose leaf mechanisms. A representative of a hand-made paper mill was much concerned at the rumoured possibility of such a change taking place—evidently, and very probably correctly, assuming that the passing of the sewn ledger would be accompanied by the passing of hand made paper also so far as those particular books were concerned. As a matter of actual fact there are very few banks in this country who are not working mechanical posting and listing appliances with loose-leaf forms to supplant what was previously a bound book province with clerical labour. So far there has been a reluctance to displace tellers books, cheque ledgers and deposit or current account ledgers. After prolonged consideration and careful investigation there is every possibility that loose-leaf methods will be introduced into these important factors in the bankers' curriculum, that is, so far as certain banks are concerned. If, and when, this happens, there will be sore disappointment for those bookbinders who depend upon banks for a large portion of their turnover.

Leathers and Cloths.

There has been very little change of late in the prices of bookbinding materials. Leathers are on a slightly increased basis, and users are paying about a penny per square foot more for basils and skivers. Pigskins and anglos are also harder in price and less easy to secure in bulk at short notice. Standard bookcloths are unaltered in price, and the variety of seconds embossed most in demand for bookbinding is costing about 1s. 2d. per yard. There are, of course, cheaper grades on the market, but they are not always so reliable or produced with so much experience as the standard lines. Union buckrams have advanced in recent months, to-day's price standing at a figure in the very close region of 2s. per yard. For literary binding and catalogue work, loose-leaf, etc., the more artistic imported buckram has a wide demand at about 1s. 10d. per yard. Where extreme strength and durability is necessary the best material to be obtained is English linen buckram at a figure round about 3s. per yard.

Dutch Strawboards.

Dutch strawboards are firm at £9 5s per ton for 8 oz. to 1½ lb.; unlined at £10 10s. per ton for heavier substances. The best advice we can tender to buyers of foreign strawboard is to hold on to stocks; buy small quantities and wait for spring when there is a probability of lower prices. Large consumers will no doubt be sounding the mills direct for spring quotations.

The Docket Controversy.

The bookbinder's docket controversy in Manchester is not yet settled and after an open meeting in that city the question has been left with the executives to dtscuss further. The point at issue, as far as we can gather, is whether the binder on miscellaneous batch work is to be allowed to dissect his own times. On principle there is no doubt that any establishment should be free to have the time booked by the worker on the job, but in practice it is exceedingly doubtful if there is anything to be gained. A bookbinder is better employed binding books than analysing mass figures. The foreman should be better able to help the management in this matter. Still the management should be free to decide what is best for itself.

Bindery Machine Wage Dispute.

The dispute regarding rates of wages payable for special power machines in London and provincial binderies reached an acute stage last week. The Conciliation Committee of the Joint Industrial Council considered the position on the 25th ult. when it was stated that a demand had been made at the Greycaine Co.'s works for the rates which had been agreed to by the London Master Printers' Association for their members. After hearing a full statement of the case, the Committee reached a unanimous decision to the effect that the Greycaine Co. was originally a bookbinding concern, but it had recently installed rotary machines to produce the "Readers' Library"; that the workers employed on the binding machines handling the work for these rotary presses should be paid according to the agreement made with the L.M.P.A., but that negotiations were proceeding for the other machines. A desire was expressed that these negotiations should be resumed forthwith. Unfortunately the workers at the Greycaine Co. refused to accept the recommendation of the Conciliation Committee, and apparently the efforts of the union were not successful in inducing them to do so. The works of the Greycaine Co. were therefore closed on Friday last, and the whole position was to be reviewed by the Conciliation Committee yesterday (Wednesday).

British Fair's Success.

From the official survey of the business done up to the ninth day at the British Industries Fair at Birmingham, it was calculated that orders so far placed amounted to £1,500,000, and little doubt was entertained that at the close on Friday night the actual orders booked would total at least £2,000,000. To this must be added the probable business resulting from inquiries made by thousands of home and overseas buyers. At a moderate estimate it is believed that the direct result of the Birmingham Fair will be the placing of orders amounting to well over £5 000,000.

According to the latest reports, the Brazilian paper market is very animated. The chief demands are for registers, note books, block-notes and printing paper in general.

A Lecture on Bookbindings.

Not enough use is made by the bookbinding industry of our national treasures in the form of fine bookbindings stored in such repositories as the British Museum and the Victoria and Albert Museum. In the libraries of these and other institutions are to be found many masterpieces of the binder's art, bindings which serve not only to exemplify the methods and artistic tastes of bygone craftsmen, and to illustrate the history of the craft, but also to suggest many a fruitful line of thought to the present-day designer. These repositories, moreover, are often blessed with librarians who are true lovers both of books and of bindings and are well able to explain, sometimes by means of public lectures, the interesting features of the treasures entrusted to their keeping.

Such a custodian is Mr. G. H. Palmer, F.S.A. Keeper of the Library at the Victoria and Albert Museum, who gave a public lecture on "Book Bindings" at the Museum on the 19th ult. The lecture was made interesting and informative from the points of view both of craft and art, though limitations of time compelled the lecturer to limit his review of bookbinding development to the period up to the end of the sixteenth century. The presence of an audience of something like a couple of hundred people, of both sexes and of very diverse ages, would seem to signify that there is considerable public interest in this subject. The lecture, which was illustrated with lantern slides, was well adapted to arouse intelligent appreciation of fine bindings and to draw attention to some of the notable examples which the nation possesses.

Introducing his subject, Mr. Palmer mentioned the instructive collection of bookbinders' tools and materials, covering the whole process of hand bookbinding, which the Museum has acquired with the generous and active assistance of Miss S. T. Prideaux, the L.C.C. Central School of Arts and Crafts, and others. The lecturer then briefly described the various operations involved in forwarding and finishing, throwing on the screen illustrations showing hand binders engaged in various stages of the work, thus giving non-technical hearers some idea of book construction before proceeding to the consideration of book decoration. The processes of finishing having been illustrated and described, there were next shown a large number of slides illustrating bindings of historical and artistic interest, covering the development of bookbinding from the earliest times.

Reference was made to the earliest known leather bindings, few of which, however, have survived from before the twelfth century. Illustrations were shown of the blind tooling found on books of that period and a little later, such work being then in perfection in England. The fact was mentioned that apparently no gold tooling was done in Europe until about 1470, when this art was carried from the East into Italy, where it then began to be used to a small extent for book decoration. Examples of beautiful Italian bindings, exhibiting marked Oriental influence in their design were shown on the screen. So were examples of fine bindings produced at or in connection with the famous press of Aldus Manutius at Venice. Due reference was made to the encouragement the art of bookbinding received at the hands of those celebrated bibliophiles, Tommaso Maioli and Jean Grolier, illustrations being shown of some notable bindings associated with their names, as also of work produced by Geoffroy Tory. The French work of Nicholas and Clovis Eve was touched upon, and just a glance given to the bindings of England (Bartlett, the royal binder of the middle of the sixteenth century receiving special mention) and of Germany and Spain. In the latter half of the sixteenth century bookbinding in northern Europe was beginning to experience a great new animation, which was to lead northern binders later to achievements rivalling those of craftsmen further south, who were earlier in the field of decorative bookbinding.

LAKCSET

Definitely prevents delays caused by plucking, filling up, or piling on blanket. A medium every printer needs for Litho, Offset or Letterpress jobs. Send for particulars.

Binders' and Rulers' Pensions.

There is to be held to-day (Thursday) the annual meeting of the Vellum Binders' and Machine Rulers' Pension Society. This Society was established in 1842, to provide pensions to vellum binders, machine rulers (or their widows), vellum sewers and numberers, being subscribers, who may become incapacitated from old age or other bodily infirmity. The amount of pensions granted is eight and nine shillings per week to males, and seven and eight shillings to females. This Society, which has a permanent fund of £2,000, has paid upwards of £12,500 in pensions since its establishment.

The committee of the Society, in submitting the eighty-second annual report and balance-sheet, state they are pleased to report that, notwithstanding the increased amount paid in pensions, the continued slump in trade, and non-receipt of the customary valued donation from their old friends of the Charity Sports Association, until too late for inclusion in this year's account, they have been able to close the year with a small increase in the funds. An election for two pensioners will be held at the annual meeting, one for a pension of 9s. weekly, and one for the H. F. Parker Charity Sports Special Pension of 7s. weekly for the highest unsuccessful candidate.

They report with pleasure that some of the anomalies of the State Old Age Pension Act have been removed, which is a great boon to their old members, but they draw attention to the need of increased financial support to this Society, as one result of the improved conditions must inevitably be an increased percentage of applicants for the Society's benefits.

Speeding up the Bindery.

It is estimated that if all the Camco-Cleveland folders built in England since the War were running simultaneously at top speed, they would be folding some 12,000,000 feet of paper per hour. The makers of the Cleveland folder claim that this apparatus has introduced a new costing basis to British binderies, binders having got away from the idea that the old folder will do 1,500 sheets an hour, that it is useless to think of reducing costs at that end, and that the much-worried machining department has got to make another cut. One of the great claims made for the Cleveland is that there is no waste of energy. For instance, if the Cleveland folds a given sheet at, say, 2,500 an hour, the user knows that if his sheet is half that size, he will get, say, 4,000 an hour. It is this quality that makes the Cleveland a "universal" folder.

The Canadian-American Machinery Co., Ltd., are specialising thoroughly in folding machines, and claim that they can supply a folder to suit everyone's need. They hold a permanent exhibition of these machines at Camco House, 63, Farringdon-street, London, E.C.4, and are always pleased to advise on all folding probl-ms.

They report that they will be having a first rate show at the Printing Trades Exhibition in the Royal Agricultural Hall in May next, showing a complete range of their folding machines, also the Kelly presses.

ANGLO-NEWFOUNDLAND DEVELOPMENT CO.—Net profit for year ended August 31st, 1924, was £203,191. Report states that sum of £10,000, together with amount of interest on stock already cancelled, has been expended in purchase of first debenture stock for cancellation. In February last, in order to provide for refunding of balance of eight per cent. guaranteed fifteen-year second mortgage debentures and to provide further capital for extension of mill, directors made an issue of £1,250,000 six per cent. second mortgage bonds to bearer. After paying preference dividends in respect of the year to August 31st, 1923, and interim dividend on eight per cent. cumulative preference shares for six months to February 29th, 1924, and after writing off one-half of cost of issuing second mortgage bonds and writing off £21,529 general construction charges, there remains £109,194. Directors propose final dividend on preference shares and dividend on second preference shares to August 31st, 1924. Directors are unable to recommend any dividend on ordinary shares.

DIVIDENDS AND REPORTS.

RAITHBY, LAWRENCE AND CO., LTD.—The annual general meeting was held at Leicester on February 23rd, mid-day, the chair being occupied by Mr. J. C. Lawrence, chairman of the company. It was agreed that a dividend be declared on the preference shares for the year 1924, at the rate of 8 per cent. per annum, less income tax, and that a dividend be declared on the ordinary shares and deferred shares for the year 1924, at the rate of 5 per cent. per annum, less income tax. Mr. Harry Whetton, a retiring director, was re-elected a director of the company.

NEW COMPANIES.

WORKERS' PUBLICATIONS, LTD.—Capital £5,000, in £1 shares; publishers, printers newspaper and magazine proprietors, etc. Private company. First directors: Dr. R. Dunstan and F. Davenport. Registered office: 35, Gray's Inn-road, W.C.1.

RUTH, LTD.—Capital £5,500, in £1 shares; to carry on in England or elsewhere the business of manufacturers of and dealers in colours, paints, chemicals, glue, size, paper, and other articles used or dealt in by painters, bookbinders, etc. Private company. Subscribers: F. L. Davie and J. G. Little. Registered office: 21, Harrington-street, Liverpool.

SWIFT ADVERTISING SERVICE, LTD.—Capital £100, in £1 shares; advertising agents, advertising and sales consultants, manufacturers' agents, and commercial advertisers. Private company. First directors: J. P. Keady and F. Scales. Registered office: 14, Kildare-street, Dublin.

WILLIAM THYNE, LTD.—Capital £60 000, in £1 shares; to carry on the business of wholesale stationers in all its branches at Lochend Works, Edinburgh. Private company. W. Thyne, managing director.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 93 of the Companies' (Consolidation) Act, 1908, and Satisfactions registered pursuant to Section 97 of the same Act. (The registration of Satisfactions is not compulsory).

PRINTERS, LTD. (Altrincham).—Particulars filed of £1,200 debentures authorised September 25th, 1924, charged on the company's undertaking and property, present and future, including uncalled capital, but excluding the freehold property of the company to the value of £850, on which the company reserves the right to borrow up to that amount and interest thereon in priority to the debentures, the amount of the present issue being £250.

WILLIAM HODGE AND CHILVER, LTD., (printers, etc., London).—Particulars filed on February 21st, 1925, by permission of the court of £4,000 debentures authorised August 21st, 1924, charged on the company's property, present and future, including uncalled capital, the amount of the present issue being £3,500.

F. BENDER AND CO., LTD.—Mortgage on certain freehold land in Vale-road, Tottenham, dated February 18th, 1925, to secure all moneys due or to become due from the company to Barclays Bank, Ltd.

PARR'S (STATIONERS), LTD. (Knaresborough).—Mortgage on freehold and leasehold premises in High-street and Market-place, Knaresborough, dated January 30th, 1925, to secure £2,100. Holders: Leeds and Holbeck Permanent Building Society, 96, Albion-street, Leeds.

PARR'S (STATIONERS), LTD.—Satisfaction in full on January 29th, 1925, of mortgage dated January 26th, 1923, securing all moneys due or to become due from the company to London County Westminster and Parr's Bank, Ltd. (now Westminster Bank, Ltd)

BANKRUPTCIES, etc.

Re JOHN MCKERROW, chromo-lithographer and designer, late of 22, Carroun-road, Fentiman-road, Kennington.—This bankrupt failed in April, 1923, and on February 27th he applied at the London Bankruptcy Court for an order of discharge. The official receiver reported that the liabilities amounted to £1,96c, and no assets whatever were disclosed. The applicant commenced the above business in October, 1917, with £300 capital, which he had not repaid, and he attributed the failure to bad trade and heavy working expenses. The official receiver opposed the application on various grounds, and the discharge was suspended for three years.

Re F. G. GREEN AND CO., LTD., 16, Southwark-street, S.E., the creditors and shareholders met at the Carey-street offices of the Board of Trade on February 27th under a compulsory winding up order made on the petition of Christiania Bank og Kreditkasse, of Christiania, judgment creditors for £1,191. The company was formed in October, 1922, with a nominal capital of £1,000, to take over as a going concern the business of wholesale export paper and envelope merchant, then being carried on by Mr. Fredk. Geo. Green at Union Bank Chambers, Southwark-street under the style of "F. G. Green and Co." A statement of affairs was presented showing unsecured debts £2,127 and loans on debentures £1,283, against assets, stock £35, good book debts £152, bad book debts £861, a deficiency of £3,223 in assets to meet the liabilities; and a total deficincy of £3,925 with regard to contributories, the issued capital being £702. In the absence of a quorum no resolution was passed and the meetings were formally adjourned, but it was intimated that the liquidation would be left in the hands of the official receiver.

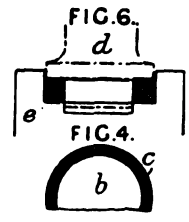
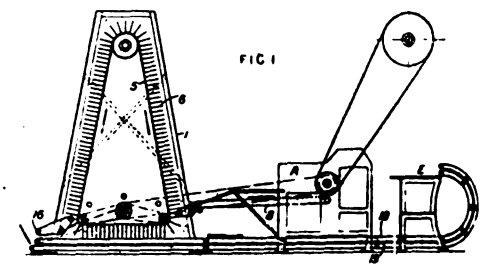
New Inventions



Dry Stereotyping Machine.

A machine for impressing stereotype and like matrices in a dry state, which is also applicable to impressing other plastic sheets such as lead sheets for subsequently making galvanoplastic blocks, comprises a fixed flat table 1, carrying the typographic or like block and the matrix blank, and a rocking platen 2 having an arcuate contacting surface engaging the blank. A resilient sheet may be placed between the blank and the platen 2 and is preferably fixed to the latter. The platen is provided with side cheeks 6 resting on the table 1, these cheeks having teeth 6a on their upper edges whereby the platen is rocked by the rotation of a roller 7 geared therewith, the roller being also oscillated by this connection about the pivotal axis 16 of arms 9 carrying the roller. At each end of the stroke of the roller 7 the platen is tilted by means of projections 6' thereon engaging hollows in the table 1. The roller 7 is rotated from a main shaft 13 by worm gearing 14, 15, sprockets 17, 18 and chains 27, and gears 20, 8 on the shaft 19 of the sprocket 18 and the roller 7 respectively. The shaft 13 is driven by reversing gear consisting of pulleys 21, 23, the former fixed to the shaft 13 and the latter connected thereto through bevel gears 24 to 26. In the case of an electric drive any usual form of reversing device may be adopted. Jockey pulleys 28 are provided for maintaining the tension of the chains 27 in both directions of running. The invention is by Mr. G. Péter.



Moulding Paper Articles.

According to a device designed by Messrs. O. Fiederer and F. Morgenstern, articles such as boxes, picture-frames, &c., are formed by winding paper with or without adhesive, into rolls or rings and submitting such rolls or rings in a moulding press to strong pressure exerted upon the edges. For example, a ring c, Fig. 4, is formed upon a mandrel b and is transferred to a press e, Fig. 6, and subjected to pressure by a plunger d in such a manner that the layers are bent to a herring-bone cross-section, as shown. The application to picture frames is described.

Drying Varnished Papers.

According to an invention by Mr. F. Poppenburger, varnished papers, particularly envelope blanks which are printed with varnish to form a window, are dried in hot air in a stove 1 through which they are conveyed by a travelling chain 5 having an upward and downward run, as shown in the sketch. The papers are removed from the varnish-applying apparatus A by a conveyer 8, which lays them on the forks 6 of the chain 5. A conveyer 16 transfers the dried papers from the chain to conveyer belts 18, 19, in which they have time to cool, and which deposits them on a table E at the side of the machine A.

AT a board meeting of J. S. Darwen and Co., Ltd., on the 16th ult., Mr. A. C. Ames and Mr. H. F. Smith were appointed joint managing directors with Mr. William Darwen.

"SUBLETHA"

THE above is the Registered name given to the only real

SUBSTITUTE FOR BOOKCLOTH FOR BOOKBINDING AND OTHER PURPOSES.

It wears equal to cloth, and the colours are fast against moisture and rubbing, and it is only about one half the price of cloth It is being used extensively by some of the best known Bookbinders and Publishers

Hand-Made Paper Romance.

More than a hundred years ago a man whose name has long been buried in oblivion, dwelling in a little village on the west coast of Japan, practised the art of pulping reeds, mixing them with water and clay, and making hand-made paper. He had as apprentice a young native of Najio, who soon became as skilled as his master.

As a proof of his esteem he offered this apprentice his daughter's hand in marriage. This offer was accepted, with the proviso that the married couple should be allowed to go away to the husband's birthplace. The old master consented, after exacting a promise from his son-in-law that he would keep his method of work a secret. The newly married couple settled in Najio, but the late apprentice did not keep his word, and he gave away the secret to his family. Overcome by remorse he never dared visit his old master, who died soon after.

The new industry flourished at Najio in the hands of the initiated and the lord of the soil made a law, yet in force, restricting the number of authorised vats in the village to 100.

The World's Printing Trade

NEARLY forty years ago "The British and Colonial Printer and Stationer's" Special Quarterly Export Issues were started, to cover the World's Printing Trade.

These special issues were almost instantaneously successful, and to-day "The British and Colonial Printer and Stationer" stands pre-eminent as the printing trade journal, carrying the message of British Print throughout the world.

Without exceeding the bounds of modesty, we can legitimately claim that this journal has made the export departments of certain firms, whilst it has increased the overseas business of its advertisers generally.

It is not for us to presume to instruct supply houses their method of doing business—we can only give you the experience of our advertisers:—

> "It will no doubt interest you to learn that during the past few years we made considerable additions to, and have extended our Export Dept. We thank you for the assistance that your Journal has contributed towards this export business.—C. B., Ltd."

"The British and Colonial Printer and Stationer" specially circulates in the following countries:—

Australasia.	East Indies.	Canada.
India.	West Indies.	United States.
South Africa.	China.	South America.
	Japan.	

The next Special Export Issue will be published on March 19th, 1925.

One of our representatives will be pleased to call upon you at your office, in your time and at your convenience. He is entirely at your disposal, and a conversation can do no harm.

Write us to-day!

X Of Interest to Envelope Manufacturers.

AT present there is an unprecedented demand for labour-saving machinery. The latest Adjustable High Speed **"Leader" Envelope Folding and Gumming Machine** has been specially designed to operate at a higher speed than any other machine of similar construction. The output is enormous, viz., 185 perfectly folded and gummed envelopes per minute, and the gumming is applied by a wipe-off gummer and not merely dabbed on. This new Machine is almost noiseless even when running at its highest speed. It is built to take any size of commercial or court envelopes within the following range—$6\frac{1}{2}$ x $3\frac{7}{8}$" down to $4\frac{1}{8}$ x 3", and any number of sizes and shapes between these limits can be produced on the same machine.

Be prepared for keen competition by installing High Speed Leaders in your plant.

THE TRIUMPH OF Modern Offset Lithography

By JOSEPH GOODMAN, F.R.P.S.,

City and Guilds of London Honours Silver and Bronze Medallist, Lithography and Photo-Mechanical Processes. Author of "Practical Modern Metalithography," etc.

Our last article in this series dealt with the producing of images on the offset printer's zinc plate in such a manner as to transpose from black to white. Two different methods were described for effecting this result, and to these we would now add particulars of a further method.

Transposing.—Method No. 3.

When the transfer has been put down and gummed in the ordinary way, wash out over the dry plate with turpentine, after which the plate must be fanned dry, the gum washed off, and the plate rolled up. Now powder the transfer with asphalte or resin, and re-sensitise the plate in the alum bath. After it has been rinsed with water and dried, the plate should be coated with a thin covering of brown shellac solution (orange shellac and pure alcohol). When the alcohol has evaporated, leaving the shellac dry, the drawing is developed by lightly rubbing with cotton wool soaked in turpentine. Should the development of the plate require too much time through the plate having been coated too thickly with shellac, the operator must not try to obtain the desired result by hard rubbing, but the plate should be put in a developing dish containing a sufficient quantity of turpentine to cover it, until the plate has been fully developed. The grease on the developed drawing must be removed by use of a weak nitric acid solution, as in method No. 2, previously described, and must be well etched with the non-corrosive etcher, gummed and dried. The shellac coating is then washed off with alcohol and water, and the drawing rolled up with black ink.

Flat Bed Offset Machining.

In commencing to print from zinc plates in the flat bed litho machine it will be necessary for those who have been long accustomed to stone to attend to a few preliminary details, though there is nothing at all formidable in the transition. The damping rollers must be the first consideration. These should be free from deleterious acids, such as contained in sour beer, nicotine, tannic extracts, etc.; pure clean water only is required for zinc printing. Some advocates of the older zinc printing processes recommend and supply a special damping solution for addition to the damping water during printing. This procedure, it must be said emphatically, is entirely unnecessary with this process, and should be strictly avoided, as it causes injury to the plate. It is desirable to re-cover the damping rollers and damping board with fresh covering material before commencing work with plates. While working, the dampers must be kept as free of ink as possible; should the fibres of the fabric become clogged with ink they are not able to convey the proper amount of moisture to the plate. A brass rider worked on the dampers picks up all stray ink. If the rollers in use upon the machine are of the smooth variety they should have a velvety matt surface imparted to them by being rubbed with artificial pumice stone. They should also, at the outset, be properly adjusted to the correct height of plane, so as to prevent bumping and knocking against the gripper edge of the plate, which not only tends to ruin the rollers, but also causes the front edge of the plate to tone unnecessarily.

Avoiding "Tinting" Trouble.

The inclined plane for the roller runners should also be set in proper position; this will prevent the rollers from skating over the plate, which might soon injure the coating and thus cause the plate to tint. It is some satisfaction to know that, should this trouble occur from neglect of the foregoing instructions, it can be easily remedied by applying a small quantity of the non-corrosive etching solution to the affected parts. Prevention is better than cure, and it should seldom be necessary to apply this remedy. The workman who complacently allows the edges of the paper to tint, "because they will afterwards be cut off," is not likely to become a shining light in his profession.

A good set of nap rollers is the pride and care of every skilful machine-minder, and is, of course, absolutely essential to machine work; it is therefore unnecessary to refer to the treatment for maintaining them in good condition. The front and back surfaces of the bed-plate should run absolutely parallel to one another, whilst the top supporting must be kept perfectly clean and free from any unevenness or gritty substance.

Cylinder Packing.

A word should be said, in passing, to emphasise the fact that where a direct flat-bed machine is being worked it is highly advantageous to have a perfect cylinder packing. A layer of smooth cartridge paper can be placed upon the periphery of the cylinder, underneath the blanket, care being taken that the blanket is stretched tightly over it, so that no scrubbing or friction on the plate can ensue. This is quite easy to attain and must be insisted upon.

Litho Inks.

Any colour of lithographic ink may be be worked from zinc plates either as a body colour, or in tint form, and without its lustre or brilliancy being in any way impaired. Yellow chrome, vermilion, or any other metallic colour of this group, can be worked from metal plates, when etched with the non-corrosive etcher, without the colour becoming in the least degree degraded. The consistency of the inks is practically the same as when stone is used, and can be adjusted by the use of the usual varnishes and sperm oil, to suit the requirements of the various papers. The damping water should be perfectly pure, without any messing additions of phosphoric acid, malt extract, etc. There is no real need for

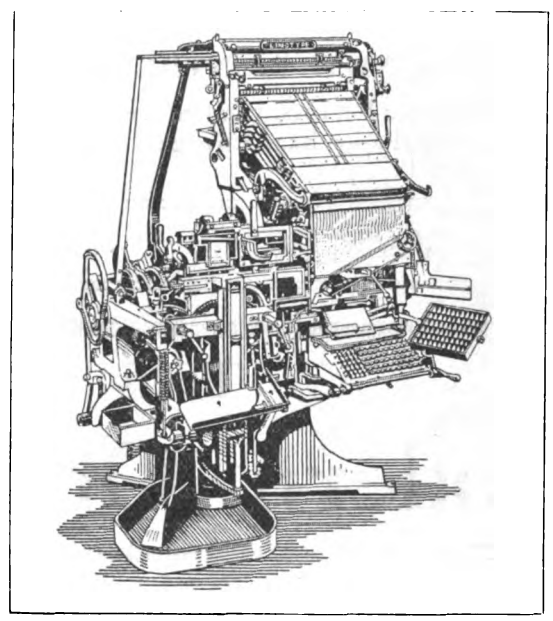
THERE ARE TWO DISTINCT MODELS OF

TRADE **LINOTYPE** MARK

COMPOSING MACHINES

Model 4



WITH OR WITHOUT SIDE MAGAZINES

The machine as illustrated has a range of 5 to 36 point, and all faces can be set from the single standard keyboard. Mould and magazine changes can be effected in a few seconds. This model can be installed with three magazines only, and the side magazine section for extra large display added to the machine at a later date.

Model 6

WITH FOUR MAIN MAGAZINES

This model is recommended to those printers whose work requires a wide variety of type faces (roman, italic and display) in one and the same line. The standard magazine equipment provides four full size magazines, any adjacent two of which can be used together. Ordinary composition can be set on this machine as readily as on Model 4.

Further Improvements:

Vice Jaw Quick-change Device
Improved Pie Chute
Assembler Shaft Drive
Magazine Escapement
Large Metal Pot
New Pot Mouthpiece
Magazine Link Motion
Dual Side Magazines
New Design Display Matrices
Assembler Light Fitting
Keyboard Lock
Sight Measure Gauges
Automatic Magazine Change
Elevator Safety Device
Blank Slug Vice Lock
Double Pump Spring
Improved Mould Wiper
Electric Pot Heater

these. They react on the colours and plate injuriously.

Starting the Printing.

After these preliminary proceedings have been attended to, the clean bed plate is put into the machine carriage, and properly adjusted for pressure, etc. The back of the printing plate (as well as the bed plate) having been cleared from dust and grit, the plate is fixed in position on the bed plate. The work is then washed-out with the washing-out tincture, used over the thin dry layer of gum, the plate being afterwards fanned dry and the gum washed off with clean water. The machine is now started and the job inked-in. Commence the running with a somewhat larger quantity of damping water and less ink than usual, and gradually reduce the quantity of water and increase the quantity of ink, until the normal amount is reached. Should the plate be accidentally scratched with particles of sand or grit, it can be easily restored by the application with the pointed edge of a hard wood pencil, of a little of the non corrosive etching solution.

Cleaning Plate Edges.

If from any cause it should be necessary to clean the edges of the plate, this can be done while the machine is running, by wiping the plate edge with a small piece of flannel moistened with the non-corrosive etching solution. It is as well to keep this solution off the dampers, and also out of the damping water; a small piece of damping cloth can be used to wipe off any excess on the plate edge, thus protecting the dampers. It may occasionally happen that some of this solution accidentally gets on to a portion of the design, causing it temporarily to disappear; this need give no cause for alarm, as the work will ra appear after a few prints. Should any specks be caused on the plate through any impurities transmitted to it from the use of common, rough, adulterated paper, these may be easily removed by means of the non-corrosive etching solution and a wood pencil. When the machine is stopped for any length of time, the plate should be thinly gummed over, as is the practice with stone.

Openings for British Trade, etc.

Inquiries have been received by the Department of Overseas Trade (Development and Intelligence), 35, Old Queen-street, London, S.W.1, to whom further inquiries should be addressed with the reference number quoted.

CANADA.

A Canadian manufacturing company is open to purchase regular supplies of waste strawboard clippings, and is desirous of getting into touch with firms who can make regular offers. Reference Canadian Government Trade Commissioner's Office, 73, Basinghall-street, London.

NEW ZEALAND.

A New Zealand firm of exporters, importers and general commission agents require the sole agency for British manufacturers of kraft papers, parchment and paper bags of all descriptions. Reference High Commissioner of New Zealand, 415, Strand, London.

"You are a great newspaper city. In proportion to population, you have far more newspapers than London," said Sir Charles Higham, the advertising expert, addressing the Leeds Publicity Club recently. "Leeds," said Sir Charles, "is to be congratulated that the *Daily Chronicle* has chosen it for its Northern headquarters. That Leeds should have, for the first time, a first-class newspaper published within its city simultaneously with London, shows how much higher it is becoming in its standing among British cities.

FRENCH PRINTERS' ANNUAL.—We have received a copy of a very fine special number of the *Bulletin Officiel* (monthly organ of the French Federation of Master Printers), entitled "Pour l'Imprimerie et le Bibliophile." It contains extensive historical monographs under the headings "Les Arts de Reproductions Graphiques," "L'Histoire de la Gravure," and "Le Papier à travers les Ages," whilst nearly half the substantial volume consists of plates, many in colours, providing a most interesting exhibition of French printing in a great variety of processes. The volume which is in stout paper covers, measures about 12½ in. by 9¾ in. by 1 in. It is obtainable from the Maitres Imprimeurs de France, 7 Rue Suger, Paris (6e), on payment of £1.

The Technique of Process Work.

IMPORTANT NEW MANUAL REVIEWED.

"THE ILFORD MANUAL OF PROCESS WORK." By L. P. Clerc. Ilford, Ltd., Ilford, London. 1924. Pp. 248 + 10. Price 7s. 6d. net., post free 7s. 11d.

The publication of this manual gives striking evidence of the progress that has been made in the technique of process work during the past twenty years.

The author is a recognised French authority in photo-mechanical and photographic problems, is the editor of a French journal dealing with these subjects, and has already published in France two books—one on photo-mechanical work and the other on three-colour processes—which have been very well received. Messrs. Ilford, Ltd., in inviting M. Clerc to write this manual have made an excellent choice, and the result is a most comprehensive exposition of the present condition of the various departments of the process trade, and one which embodies the most recent additions to our knowledge of the subjects treated.

M. Clerc explains in the preface that the methods he describes are principally those used in France, and that the workshop practice may be different in this country; but the inclusion by the author of a number of articles and communications by English workers secures a satisfactory balance in the working methods that are discussed.

The publishers have undertaken with considerable success the translation of the original manuscript. The book is well printed, but it is much to be regretted that such a small type should have been chosen. Readers who are not blessed with strong eyesight will find the reading less pleasant than it would otherwise have been. The use of a larger type would certainly have been advisable even though it involved increasing the price.

The book is divided into seven parts. The first includes the equipment of the studio, with a chapter on the principles of colour and dry plates; the second is on line engraving; the third, on black-and white half-tone; the fourth, on photo-lithography and photo-metallography; the fifth on photogravure; the sixth, on the three colour process and its applications; and the seventh, on polychromatic interpretations.

The general introductory section on cameras, lenses and the nature of colour, is of special value; it gives concise scientific explanations of the various phenomena in simple language, and will be extremely helpful to practical photo-lithographers as well as to general printers who wish to extend their knowledge of this subject. Many interesting practical colour problems are most carefully explained.

In respect of the practice of negative-making, attention is confined to the use of dry plates, and the author gives a short account of the theory of sensitometry (or the means by which the characteristic qualities of any plate are obtained) as well as full instructions for the use of both ordinary process plates and panchromatic plates.

The section on half-tone negatives includes the results of the author's investigations of the principles of the half-tone process, together with the most recent methods of simplified half-tone negative-making, as well as an account of high-light processes. The methods of obtaining broken-tone results from continuous tone negatives, by placing some sort of screen between the negative and the sensitive plate, or in front of the negative during exposure, are of undoubted value in photo-lithography.

In dealing with the making of line blocks on zinc, the various types of original are described, and a full account is given of the methods of printing from the negatives on to zinc plates as well as details of the line etching processes, including both the rolling up method, and the dragon's blood process which is the standard present-day practice.

The chapters devoted to half-tone printing on metal and etching, are exhaustive, and deal with the subject both from the elementary and the advanced standpoints. Among the screens that are mentioned, the wavy-line screen invented by Mr. Dargavel is worthy of special notice; this screen gives an approximation to the effect of a wood engraving.

The letterpress printer will note that special attention has been given to the important subject of mounting—though there have been published contributions to this subject more recent than those to which M. Clerc refers.

The section on photo lithography includes a description of the usual transfer and direct processes as well as the Vandyke and Douglagraph processes and other methods of black and white reversal.

A useful account is given of the economical and simple bromoil process of making photo-litho transfers, a process which is particularly valuable in making large plates for poster work, either in line or in half-tone. The negative to be enlarged is placed in the enlarging lantern and a piece of suitable bromide paper exposed; after development, the bromide paper is treated with a bleaching solution which hardens the gelatine in the parts containing the developed image so that they may be inked in the same manner as an ordinary photo-litho transfer. The method described is one suggested by Mr. W. G. J. Smith.

The classic explanation of the formation of the lithographic image is that the original design is made with an ink in which soap is an essential constituent. By the action of nitric acid the soap in the ink is decomposed, liberating a fatty acid which stops the pores and probably re-combines with the stone. No doubt this theory is satisfactory in the case of work which is drawn direct on stone or plate; but it cannot be said to hold in many commercial methods of preparing a lithographic image or in the majority of direct photo-lithographic processes. Although the subject has not been fully investigated, it is probable that the colloidal chemist will be able to find a more satisfactory theory to explain the permanence of lithographic images.

A method which this author describes of direct printing on stone is worthy of attention. It is suggested that a coating of bichromated albumen may be evenly applied with the aid of a pad, the excess being afterwards removed by the same pad, from which all the excess of solution has been squeezed out. We have not seen this method in operation in this country, but it recommends itself as a distinctly practical idea.

A short chapter is devoted to direct photo-lithography from continuous tone negatives.

The pages devoted to photogravure give a most comprehensive account of the process.

A chapter is devoted to the subject of colour filters; although these are ordinarily used in three-colour work, special filters are also manufactured to deal with exceptional technical problems. Introducing the subject of three colour work, the author explains the principles of three colour reproduction. The progress that has been made in determining the correct absorptions of three colour filters is duly indicated. Twenty years ago, after the investigations of Newton and Bull into the principles of three-colour work had led to the adoption of standard filters, it was found that a considerable amount of fine etching was necessary on the red printing plate, and since that time the absorption of the filters as recommended has been modified. Spectrum photographs of standard modern three colour filters show the progress that has been made in this direction.

In writing textbooks on craft subjects, it is customary for authors to make use of the writings of writers who have preceded them, and to embody the information in their text, occasionally with an acknowledgment in the preface. The present manual is a notable exception to this practice, and its value is thereby considerably augmented. Constant reference is made to methods of working or investigations by English workers, and at the end of each chapter a bibliography of works or papers of reference is added, so that readers may know where to seek further information on the subject under discussion. A complete index, as well as an index of authors, is included. This can be recommended as a thoroughly useful book for the practical worker and the student and as a work of reference for the printer.

R. B. FISHENDEN.

Lithographers' Pension Effort.

Mr. Charles H. Crabtree as Chairman.

The Lithographers' Auxiliary to the Printers' Pension, Almshouse and Orphan Asylum Corporation is to hold its next concert at the Cannon-street Hotel on March

Mr. Charles H. Crabtree.

20th. This successful Auxiliary, of which Mr. R. Andrew Spottiswoode is president, will, on this occasion, have the services in the chair of Mr. Charles H. Crabtree, chairman of the celebrated Leeds firm of printers' engineers, Messrs. R. W. Crabtree and Sons, Ltd.

Mr. Crabtree and the firm he represents are both well known throughout the printing industry for a multiplicity of services to the cause of printers' charities, as well as for their eminence in the important field of engineering in which they are engaged. The whole of Mr. Crabtree's career in the printing trade has been spent with the firm of R. W. Crabtree and Sons, Ltd., which, founded by his father some thirty years ago as a private partnership, was in 1920 converted into a limited company, with Mr. Crabtree as chairman and managing director. He is chairman also of Pictorial Machinery Ltd., a firm well known to lithographers everywhere in connection with the development of scientific apparatus on the photographic side of the lithographer's craft.

Mr. Crabtree has a wide circle of friends scattered over all quarters of the country, with whom he has come into contact through his work on behalf of his firm, whose lithographic machines, offset machines and rotary newspaper presses are familiar throughout printerdom. The firm takes pride in its entirely British character, and also recalls with gratification that during the War Messrs. R. W. Crabtree and Sons, Ltd., were actively engaged, at the call of the War Office, in precision engineering work in aid of the British air services—their capabilities for which work bears testimony to the qualifications of the firm in the direction of precision apparatus in the field of print.

Mr. Crabtree will doubtless not be disappointed in looking for support from lithographers and printers generally in the charitable effort to which he has now set his hand.

THE liability of agents for the income tax of their foreign principals is the subject of a circular issued by the London Chamber of Commerce, which states that Mr. Walter Guinness received at the Treasury a small, but representative, deputation headed by the Members of Parliament for the City, Mr. E. C. Grenfell and Sir Thomas Vansittart Bowater. The deputation included Sir Keith Price (Timber Agents' and Brokers' Association of the United Kingdom). It is added that the proceedings were private, but Mr. Guinness repeated the assurance given by his predecessor—that the international and entrepôt trade would be protected—and promised to bring the whole matter before the Chancellor.

Merton Board Mill, Ltd.

Mr. Justice Romer, in the Winding-Up Court last week, made an order for the compulsory liquidation of the Merton Board Mill, Ltd., on the petition of H. Burton and Co., Ltd.

The petition had been adjourned for the production of evidence as to the progress of negotiations for a scheme of arrangement.

Mr. Spens, for the respondent company, read an affidavit by Mr. Albert Hugh Stevenson, chairman of directors, stating that the negotiations were still proceeding with two financial groups, and if the petition was adjourned for a month there would be some result, successful or otherwise, in the meantime.

Mr. Carr (for the Treasury Solicitor) said he was instructed to inform his Lordship that the negotiations had broken down, and he (the Treasury Solicitor) was proposing to apply for the appointment of a receiver and manager in a debenture-holders' action which he proposed to bring.

A. W. K. Trueman & Co., Ltd.

The petition of Hall and Co., Ltd., for an order for the compulsory liquidation of A. W. K. Trueman and Co., Ltd., which had been adjourned from time to time, was again before Mr. Justice Romer in the Winding-Up Court last week.

Mr. Israel, for the petitioners, said every creditor had assented to a scheme of arrangement except one, who was abroad. He shonld not object to another adjournment to get his consent, but it must be the last.

His Lordship adjourned the petition for another 14 days.

THE Bradford and District Newspaper Co announces that a sum of £100,000 is about to be expended on extension of premises and printing plant.

Lithographic Trade Review.

NOTES AND NEWS.

The lithographic section of the industry would seem to be getting a good share of such printing orders as are going, and we think there is generally good ground for satisfaction at the state of trade. It is all in the right direction that London lithographic printers have less employment than a month ago. Business is much better than it was at this time last year, and it appears to be on the up grade. Amongst lithographic artists, too, it is felt that, considering the low state of industry throughout the country the amount of business coming to this section is in every way satisfactory. As far as unemployment is concerned the figures to-day compare very favourwith the average of pre-war years. With regard to the process side of the trade there has been a slight boom in colour work, in spite of German and Austrian competition, although of course a fair amount of this class of work is going abroad on account of cheaper rates.

Agreement was reached before last week-end in respect of the rates of wages for flat-bed offset work. The executives of the Federation of Master Printers and of the Amalgamated Society of Lithographic Printers have, with the aid of the Conciliation Committee, accepted an agreement worded as follows: "That 4s. be agreed to as from the second pay day in April as the additional minimum rate payable to members of the Amalgamated Society of Lithographic Printers working flat bed offset machines above the minimum rates fixed in the National Agreement for direct flat-bed machines on the understanding that negotiations may be resumed one year hence with a view to reaching agreement on the 5s. claimed and on condition that the wages at present paid above the new minimum be not disturbed. Men who have been engaged for, or have for six weeks continuously worked on a flat-bed offset machine, shall not be reduced to a lower rate without the usual notice, and during the period of the notice the higher rate shall be paid. It is understood that such notice is not a notice of dismissal or of leaving a situation unless this is definitely stated by either party at the time such notice is given."

The half-yearly report of the Amalgamated Society of Lithographic Printers (and Auxiliaries) of Great Britain and Ireland, just issued, covers the period from June 9th to December 8th, 1924. Although the income, £25,501, shows a decrease compared with the previous half year of £2,134, the total funds of the Society at December 8th stood at £83,493. The report contains portraits of Mr. J. W. Clark, who has completed 25 years of service with the Hull branch, of which he is secretary, and of Mr. J. J. Brailby, president of the Leeds branch, who has been made a J.P.

Mr. Frederic T. Corkett, managing director of Pictorial Machinery, Ltd., has recently been travelling on the Continent, particularly in Italy, and comes back impressed with the palatial character of some of the Italian printing houses. Mr. Corkett found Italian printers keenly interested in technical developments, especially in regard to photo-litho and the mechanical means of printing negatives down on to metal plates; they were all very interested in the "Lithotex" Step-and-Repeat Machine.

We understand that a contract has just been made with one of the largest firms in Italy to put in the very latest step-and-repeat machine, and that complete plants are being sent into Belgium and Spain, whilst the "Lithotex" people are expecting also to put a very fine installation into one of the most important printing establishments in Switzerland. Many uses are being found for the step and-repeat machine which were not at first contemplated, perhaps the latest being the manufacture of fine screens and the production of suitable irregular screens for photogravure work and the usual type of screens for other photo-mechanical usages.

Mr. A. J. Dowden, assistant to Mr. Woodgate Stevens of the London branch of the Amalgamated Society of Lithographic Printers had recently to undergo a serious operation. Wishes for his recovery to health and strength have been expressed in many quarters from a wide circle of friends.

An American contemporary reports that a printing press in which six flat beds rotate in front of a single impression cylinder is now in course of construction at 124, White-street, New York, and should be ready for actual work this month. The six type formes in this press are each 17 by 22 inches, and from them can be printed six different jobs each in a different colour, or in one colour; three separate jobs in two colours; two separate jobs in three colours, or one job in six colours. In addition, presses of this design can be made to print in either direct or offset planography. The press is the invention of August Swoboda, patent No. 1,440,203, issued in 1922.

An institution that appears to hold promise of great usefulness for the advancement of lithography is the Lithographic Technical Foundation, Inc., of New York City. This foundation, of which the inaugural meeting was recently held, was incorporated some months ago for charitable, scientific and educational purposes. It proposes to devote itself continuously to research, education and training in the lithographic field. Heretofore the lithographic arts and sciences have depended for their improvement and advancement upon the spasmodic and haphazard efforts of individuals. It is now proposed to have trained scientists of acknowledged ability devote their constant efforts upon different problems, one after another, which have long been recognised and complained against, but which continued as perplexities because they have been everybody's business, with the usual evil result.

"On wan days we call lithography the Cinderella of the graphic arts, but the figure is false. It were truer to talk of an infant Hermes kicking his god-like legs over the cradle and running to round up the celestial cattle. Lithography is an art in its youth with a great future before it; but much of its youth has been mis-spent; there has been too much cattle lifting. Or still more truly is lithography the young Dionysus huddled in the thigh of Zeus to be protected from evil wills; many such have surrounded it from its birth; but the days of its divine madness are ahead; it is a god, and the world willingly or unwillingly will come to serve its rites and celebrate its mysteries." Thus writes Mr. John Copley in that excellent little magazine the *Print Collector's Quarterly*. His article is on "Some Lithographs of the Past and the Future," with illustrations, and is inspiringly suggestive of the possibilities of lithography from the artist's point of view.

New Trade Marks.

FELIX.

454,619. Post cards, Christmas cards or folders, books, calenders and cigarette cards. Robert McCrum, trading as The International Art Co., Florence House, Nassau-road, Barnes, London, S.W.13; printer and publisher.—December 18th, 1924.

DUOLOID.

453,581. Tracing material, included in Class 39. Lawes Bros., Ltd., 7, 8, 9, Burrup-place, Doris-street, Kenington, London, S.E.11; drawing office stationers.—12th November, 1924.

It is good to win a sharp bargain, but it is better to win a satisfied customer.

Thomas de la Rue & Co., Ltd.

A general meeting of the holders of the convertible 8 per cent. mortgage debenture stock of Thomas de la Rue and Co., Ltd., was held on Friday for the purpose of considering a scheme for the reorganisation of the company's capital. Under this scheme holders of the 8 per cent. debenture stock were asked to surrender their stock and to accept in satisfaction 50 per cent. of the face value thereof in ordinary shares. As part of the same scheme the existing ordinary shareholders were asked to consent to write 19s. 6d. off each pound share. The various resolutions were carried by an overwhelming majority.

Mr. Sidney Lamert, chairman, in the course of his speech, said that in his opinion, shareholders would be substantially better off this year than they were last year, and he hoped and believed that next year they would be still better off, working free of the enormous incubus which was over the business now. Pens were doing very well, and playing cards were doing well. During several weeks towards the end of last year they were making and selling 130,000 packs of playing cards a week. Security printing was increasing, and security printing was probably the best hope they had for the future, although it had entailed the provision of a substantial amount of new machinery.

In the course of some discussion, the chairman stated that eminent counsel advised that the company had ground of action against Mr. Stuart de la Rue, formerly chairman of the company, in connection with the purchase of the ordinary share capital of Weir's and a writ had been issued against that gentleman.

The meeting of the Association of Master Printers of West and North-West London on Monday next will discuss the following topics:—"How a Small Printer Can Advertise" (Mr. H. W. Searle), "The Pride of a Printer" (Mr. F. A. Perry), and "Bad Debts: a Printer's Problem" (Mr. P. G. Crannis).

CAXTON CONVALESCENT HOME, Limpsfield, Surrey.

President—C. J. Drummond, Esq., M.B.E., J.P.
Treasurer—The Right Hon. C. W. Bowerman, J.P., M.P.

Devoted exclusively to the use of Men and Women engaged in the Printing, Process Engraving, Bookbinding, Stationery, and Kindred Trades. Patients received from all parts of the Country.

A Subscription of Three Guineas annually by an Employer, Society or Workshop gives the right to nominate a Patient each year for a Three Weeks' residence at the Home on recovery from illness.

Penny-a-week Subscriptions from employees are earnestly solicited. Annual Subscribers (minimum 4/-), through a collector or direct to the Office, are entitled to a Three Weeks' stay at the Home entirely free. Wives of men in the trade are now admitted.

Paying Patients: £1 11s. 6d. per week.

DONATIONS TO THE
WEST-WING FUND
WILL BE WELCOMED.
Received to date : £560

Photogravure: Methods and Machinery.

Mr. R. B. Fishenden Lectures at Stationers' Hall.

The excellent series of technical lectures arranged at Stationers' Hall by the London Central Districts Master Printers' Association was brought to a fitting climax on Wednesday evening of last week, when the concluding lecture was delivered by Mr. R. B Fishenden, M Sc.Tech., who took for his subject "Photogravure from the Printer's Standpoint: Methods and Machinery." The lecture was held in the Court Room, which was filled to overflowing, the attendance being larger than at any preceding lecture of the series. There were present several visitors from abroad, including Japan, South America and Cape Colony, together with a number of printers from the provinces, as well as many prominent representatives of the London trade, the company being an unusually comprehensive one.

Set out in the main hall was a remarkable exhibition of photogravure specimens in monochrome and colour, together with technical exhibits of unusual interest. An outstanding feature was the exhibit of the Amalgamated Press, Ltd., who sent several coppered cylinders showing the stages of production from the turning and grinding, through the intermediate "resist" stage, up to the highly finished surface bearing the etched printing images. The same firm sent a fine selection of photogravure printing including periodical and commercial work. Another cylinder shown was one prepared for textile printing by Pictorial Machinery, Ltd., who also showed specimens of photogravure printing. Others contributing to the exhibition of specimens—which made a beautiful and impressive show—were *Illustrated London News* and *Sketch*, Ltd., Penrose and Co., Ltd., Sun Engraving Co., Ltd, Rembrandt Intaglio Printing Co., Ltd., Emery Walker, Ltd., Mr. G. W. Jones, Waterlow and Sons, Ltd., *Cape Times*, *Southend Standard*, G. and G. Ponton (Glasgow), Art Reproduction Co., Ltd., L.C.C. School of Photo-Engraving, John Swain and Son, Ltd., Vandyck Printers, Ltd., and Soldans, Ltd.

The chair was occupied by the president of the Association, Mr. Geo. Eaton Hart, who was supported by Mr. Alfred Langley, the president of the London Master Printers' Association, and Mr. W. J. Boyle, hon. sec. of the local Association.

Mr. Hart, introducing the lecturer, expressed gratification at the large attendance which the lecture had attracted, and referred to Mr. Fishenden's expert qualifications to deal with the subject of photogravure, going on to refer to that gentleman's position as London manager of Messrs. Stephenson, Blake and Co., Ltd., whose name, he said, was held in high esteem by printers everywhere.

Mr. Fishenden was then called upon to deliver his lecture. Of this we have room for only a general account in this issue, but hope to report it more fully later.

Antecedents of Photogravure.

After indicating the interest and value of the photogravure process at the present time, Mr. Fishenden reverted to the older methods of intaglio printing, copperplate, aquatone and mezzotint, and called to mind the subtle beauties achieved by artist etchers in the production of varied effects of light and shade in their etching. He went on to explain, with the aid of blackboard sketches, how, by virtue of the varying depths of engraved lines or "cells," from which the ink is transferred to the paper, any intaglio process is able to produce stronger contrasts of tone than is ordinarily possible by methods such as half tone block printing or lithography, in which the thickness of the ink film placed upon the paper has to be comparatively uniform. Attention was called to the fact that rotary intaglio printing is really an old process, having for long been used for calico printing and the production of wall paper.

Proceeding to the subject of photo-mechanical intaglio processes, Mr. Fishenden drew a sharp distinction between invert half-tone and photogravure proper, the "partial resist" employed in the latter process (as against the "perfect resist" used in letterpress half tone or in invert half-tone), giving the desired varying depths of cavity and consequent contrasts of tone. He then briefly recalled the history of photo engraving from the days of Fox Talbot up to modern rotary photogravure as exemplified by the products of the Rembrandt Intaglio Printing Co., Ltd., to the outstanding excellence of whose work he paid a high tribute. Next came a summary of the processes involved in the production of a cylinder for photogravure printing. With the aid of exhibits such as photographic negatives, a roll of carbon tissue, a piece of photogravure screen, and so on, Mr. Fishenden explained the methods and rationale of the producing of the printing image upon the copper surface of the cylinder. The distinctive features of photogravure printing machinery were then touched upon, to be discussed more in detail in connection with the lantern views shown later.

Photogravure Periodicals.

In regard to the printing of periodicals by photogravure, Mr. Fishenden admitted that—though the Rembrandt Intaglio Printing Co., Ltd., were first in the field with machine photogravure, thus giving the honour of its introduction to England—Germany claimed priority in the application of intaglio printing to newspaper illustrations, the *Frankfurter Zeitung* making this innovation in 1910. He mentioned, however, a suggestion of his own made in 1905 as to the possibility of newspaper printing by intaglio methods. A tribute was paid to the work of Mr. Charles E. Bell, late of Intaglio Patents, Ltd., in the development of photogravure for newspaper work, and in the excellent photogravure printing being done by the Amalgamated Press, Ltd. The connection of Mr. Frederic C. Corkett, of Pictorial Machinery, Ltd., with the development of gravure was also mentioned.

The advantages and possibilities of offset photogravure were touched upon. Appreciative mention was made of the experimental Renaissance machine and some excellent trial prints made in colour by Mr. Geo. W. Jones; and special reference was made to an offset gravure machine just perfected by Mr. Owen, of Penrose's, a distinctive feature of which is the use of a printing surface in the form of a copper sheet stretched around a cylinder. After a few words on inks for photogravure printing, the speaker dealt briefly with the subject of colour gravure, in respect of which he prophesied that when the practical difficulties surrounding this work came to be tackled as earnestly as had been the practical difficulties surrounding ordinary gravure, colour photogravure would become a successful commercial process.

Some Excellent Lantern Slides.

The next stage of the lecture was the showing of lantern slides, with explanations and comments. Mr. Fishenden's unique collection of slides is very comprehensive, and the subjects are of much technical interest. Several photo micrographs served well to illustrate the differences between the tonal effects produced in a case of ordinary half-tone, invert half-tone and machine gravure; among other photo-micrographs was one showing an actual section of an etched photogravure plate indicating the varying depths of cavity. There were several diagrams to aid in the understanding of principles and apparatus, and a few graphs making plain the effects of etching solutions of varying densities. An illustration was shown of the machine for the application of the gelatine film to cylinders by the expedient of using a water jet to impinge between the film and cylinder, and so apply the film without wetting and stretching the paper backing; and among other machinery items illustrated were cylinder grinding machines, photogravure ink mills (Winstone's), six-colour duplex calico as well as wall-paper printing machines, the Bell photogravure machine with intermediate pressure bowl, litho machines converted for photogravure, the Waite photogravure machine (using plate face downwards), the Kempe machine, the Penrose Velogravure machine, the Johannesburg machine, the new small "Pickup" rotary machine, the Marinoni-Voirin sheet-fed rotary gravure machine and several Hoe presses.

Throughout his discourse Mr. Fishenden showed himself to be the possessor not only of an extensive and detailed knowledge of his subject but also of considerable ability in the art of clear exposition. On resuming his seat he received a very cordial ovation.

Discussion.

The chairman remarked that the lecture had been a fascinating and educative one, and, in throwing the meeting open for questions and discussion, he emphasised the need shown by the lecture for specialised knowledge in this new era of scientific printing.

Mr. Colebrook raised the question of the possibility of getting electrotypes of gravure cylinders, and Mr. Fishenden replied that he thought electrotyping methods somewhat questionable in this application, particularly in view of the pressure required and the delicate nature of the "cell" walls in the photogravure printing surface; moreover, the time required would probably be as long as for the much more satisfactory method of duplicating the engraved cylinder.

Replying to a question by the chairman as to improving the clearness of letterpress matter printed by photogravure, the lecturer suggested a possible method, but admitted that he could not see any really practicable way in which the screen used for the pictures could be dispensed with for accompanying text, but he expressed the opinion that the great improvement in the printing of type matter was the most notable development in the history of photogravure during the last decade.

To a query as to the possibility of getting the depth of etching exactly similar in any two cylinders, Mr. Fishenden replied that the wonderful regularity of the one-pound currency notes is sufficient evidence of this possibility.

As to length of runs practicable in photogravure, the reply was that 120,000 from a single engraved cylinder was an ordinary run.

To a querist who doubted the possibility of quick drying of heavy colour impressions in photogravure, Mr. Fishenden said the ink would be dried in 14 seconds and that heating was necessary only in the case of very fast-running machinery and that the air blast was surprisingly effective for quick drying.

With regard to flat-bed photogravure Mr. Fishenden indicated the success that had been attained, in spite of the technical difficulties, but he could see no advantage in adopting a flat-bed or reciprocating machine when the process was so eminently suitable for rotary printing. The litho trade had taken advantage of rotary printing to replace the flat-bed.

The vote of thanks to the lecturer was proposed by Mr. Langley, who said they had had a wonderfully informative evening, and he thought it a striking tribute to the printing trade as a whole that London printers were able to get a man like Mr. Fishenden to place his knowledge at their disposal in the way he had done that night. Speaking as president of the London Master Printers' Association, Mr. Langley heartily tendered his personal thanks and the thanks of the Association for the great services Mr. Fishenden was rendering to the trade.

Mr. A. Alexander seconded the vote of thanks, which was carried with enthusiasm.

Mr. Fishenden, in responding, called for the support of the meeting, which was heartily given, in thanking very cordially all those who had assisted in bringing together the excellent collection of exhibits. He particularly mentioned the assistance given him by Mr. Bell of the Amalgamated Press, by courtesy of Brig.-Gen. Mildren.

Before the meeting broke up Mr. F. E. Tacey, who said he spoke as a representative of the outer London districts, offered congratulations and thanks to the Central London Master Printers for providing so useful a series of lectures for the benefit of the craft.

THE late Sir W. J. Ingram, Bart. (77), of Westgate on-Sea, Kent, formerly principal proprietor of the *Illustrated London News* and the *Sketch*, left £264,715, with net personalty £245,555.

Master Printers' Whist Drive.

Another successful whist drive and concert was held on Tuesday, March 3rd, under the auspices of the South-West London Master Printers' Association. Arding and Hobbs' Restaurant was again the venue and Mr. and Mrs. R. B. Simnett performed the functions of host and hostess very agreeably. The programme consisted of a whist drive, which was thoroughly enjoyed, an interval for refreshments, and finally a very enjoyable concert, to which there contributed Miss Joan Meredith (versatile entertainer), Mr. Frederick Shaw (tenor), and Mr. A. H. Howe (humorist).

At the conclusion of the whist drive, Mrs. Simnett presented the prizes as follows: Ladies, 1st, Mrs. Harvey (pencil case); 2nd, Mrs. Ballard (fern pot); mystery prize, Miss Purvis. Gentlemen, 1st, Mr. W. F. Willsher (suit case); 2nd, Mr. E. G. Baker (hair brushes); mystery prize, Mr. Alfred Langley (wallet).

Very little time was devoted to speeches, but Mr. Simnett, by way of introducing the president of the Association (Mr. A. Langley), and the vice-president (Mr. F. R. Muir), observed that if the ladies were to be able to don appropriate dresses for such social functions as they were holding that evening, it was necessary that their husbands should attend the business meetings of the Association, which were profitable not only to themselves but to the trade as a whole.

Mr. Langley, also speaking in a light vein, referred to the opportunities which the Annual Cost Congress and General Conference at Buxton early in May would afford the ladies of exhibiting the dresses to which Mr. Simnett had referred.

Mr. Muir recalled that there would be an even earlier occasion on which to display this fine raiment, namely the annual dinner of the London Master Printers' Association on April 27th.

The arrangements for the evening were, as usual, very well made by Mr. F. H. Cole and Mr. Fred Chivers, while the large number attending made the function a distinct social success.

Stationery Office Estimates.

On a supplementary estimate for £45,000 for salaries and expenses of the Stationery Office, Sir H. Craik, in the House of Commons on Tuesday, said he entertained strong suspicions about the conduct of this office. To ask for an increase of £15.000 under three different heads was a slovenly way of framing an estimate.

Sir J. Simon found himself in warm sympathy with what Sir H. Craik had said.

Mr. Guinness (Financial Secretary, Treasury) replied that the Supplementary Estimate was the result of the original estimate being cut too much. There had been very great under-spending in the department for three years running. In 1921-22 this under-spending was £1,425,000, and in 1922-23 £1,125,000. In 1923-24 a drastic cut was made, and even then the under-spending was £120,000. After that period prices of materials ceased to fall, and were now higher. Paper stocks were exhausted and economy in binding in previous years had resulted in books beginning to fall to pieces, with the result that expenditure upon them was necessary. That the amount asked for under each heading was the same was simply a coincidence. They could not have close estimating and at the same time avoid supplementary estimates.

The vote was agreed to.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies,
Machinery for Sale and Wanted,
Businesses for Sale and Wanted,
Partnerships and Investments,
Miscellaneous.

Cheaper Postage.

IT would seem that there are still some who express the view that a reduction of postal rates would mean the subsidising at the cost of the community of traders who make large use of the post—overlooking the obvious fact that to use the Post Office surplus for any extraneous purpose, say the reducing of income-tax, would mean the subsidising of income-tax payers at the cost of users of the post. Mr. Harold Cox's communications to *The Times* on this subject have drawn a rejoinder from Sir Adolph Tuck, who, in a letter to that journal, stresses the fact that a reduction in the postage of letters and post cards is not only in the interests of the nation as a whole, but actually of each individual member of the nation. Sir Adolph goes on to say "It is an open secret that the majority of the Labour Government, who surely could not be accused of extending the class privileges referred to by Mr. Cox, was in favour of re-instating the penny letter and its attendant halfpenny post card postage, and it was only the strong individuality of Mr. Snowden that prevented this being carried out in their first, which Fate ordained to be their only, Budget. Five successive Postmasters General have expressed themselves in favour of a return to the penny post, and in each case it was the Chancellor of the Exchequer, with whom the last word rested, who decided upon yielding (again quoting Mr. Cox) to clamorous private interests, instead. Fortunately, we have a strong, far-seeing Chancellor of the Exchequer at the helm of affairs to-day, who is not likely to allow himself to be guided by the unsound economic theory by which . . . Mr. Harold Cox has permitted himself for once in a way to be led astray, and it will be a matter of surprise to many if Mr. Winston Churchill's name does not go down to posterity as the statesman who restored the penny postage."

Personal.

THE Prince of Wales, attended by Sir Godfrey Thomas, Bart., visited the offices of *The Times* newspaper, Printing House square, on Wednesday of last week, and remained to luncheon with the directors.

MR. WILLIAM ASTLE, O.B.E., J.P., of the *Stockport Advertiser*, the president of the Newspaper Society, will take the chair at the annual dinner of the Society on May 5th. The Prime Minister has accepted the Society's invitation for that occasion.

MR. H. R. GRUBB (of Croydon) was elected president of the Association of Master Printers of South-East London at the Association's annual general meeting held on Tuesday evening, and Messrs. J. Lack and H. H. Norman were elected vice-presidents. The business meeting was followed by a very pleasant social and musical evening.

MR. W. J. POLLOCK, a member of the committee of the West and North-West London Master Printers' Association, has consented to read a paper before the next general conference of the Technical Association of the Papermakers' Association. Like Mr. Riddell, he will take up the subject of paper from the printer's point of view.

MR. J. D. HARVEY, retiring president of Newcastle-upon-Tyne branch of the Typographical Association, was honoured at a "smoker" in that city on Saturday night, when he was presented with a cheque in appreciation of past services. Mr. J. Dixon, who made the presentation, said Mr. Harvey had been a member of the Association for 49 years, a member of the branch for 45 years, five years on the branch committee, 12 years vice-president, 12 years president, and for 16 years an executive council member.

MR. W. S. WALKER, who for 37 years has been secretary to the Birmingham Typographical Society, has retired from that position, and was on Saturday presented with a cheque for £200 and a tea and coffee service. He was also presented by the Birmingham master printers with a set of bowls and by the Jobbing Printers' Guild with a case of pipes. The presentation was made at a complimentary dinner.

MR. E. B. BLAKE, secretary of Shrewsbury branch National Union of Printing, Bookbinding, Machine Rulers and Paper Workers, has been returned unopposed to Shropshire County Council.

MR. JAMES PIERCE PARKINSON, a respected compositor on the staff of the *Clitheroe Advertiser*, has just celebrated his 62nd birthday, and has also completed fifty years at the case.

MR. PERCY BARRINGER, president of the Stationers' Association of the United Kingdom, will take the chair at the meeting at Stationers' Hall on the 13th inst. (6.30 p.m.), when "Pens, Ancient and Modern" will be discussed by Messrs. Henry Hill, Wm. B. Mitchell and L. G. Sloan, J.P.

MR. FREDERICK PEAKER (president of the Institute of Journalists) was admitted a member of Gallery Lodge, No. 1,928, which held its annual ladies' festival on Saturday, at the Restaurant Frascati, Oxford-street.

MR. C. HAROLD VERNON has been awarded by the Publicity Club of London its 100 guinea silver cup for the most notable advertising achievement of the year. Mr. Vernon was chairman of the Organising Committee of the International Advertising Convention which met at Wembley.

MR. RICHARD IVENS, who for forty years has been the editor of the *Nottingham Guardian*, has just resigned that position, and will in future live in retirement at Whatton-in-the-Vale.

COL. C. D. SHELDON has been appointed examiner in paper technology by the City and Guilds of London Institute, on the nomination of the Papermakers' Association, and will serve for five years jointly with Mr. Arthur Baker.

Digitized by Google

Bookbinders' Overseers' Dinner.

Large and Representative Gathering.

The twenty-first annual dinner of the Printing, Bookbinding and Kindred Trades Overseers' Association was held on Saturday in the Crown Room, Holborn Restaurant, Mr. J. Fleming (president) occupying the chair. The excellent arrangements made by the stewards for the comfort and enjoyment of the members, their ladies and the visitors resulted in a very successful evening. An interesting little episode in the proceedings was the presentation of a miniature of the president's collar and badge of office to six gentlemen who had formerly held the office of president of the Association. The company included Messrs. W. Alleston, A. G. Aves, R. H. Berry (president, P.M. and O.A.), Geo. Bell, W. Bullett (secretary, Electrotypers and Stereotypers Managers' and Overseers' Association), A. J. Daines, J. Dixon, T. Goodall, J. A. Gouldbourne, A.W. Hunt, J. Jones, W. T. Lingham, A S. Long, H. Milton, F. C. Peacock, C. S. Rolls, B. J. Sansom, J. Walker and E. W. Whittle (secretary, P.M. and O.A.).

During the course of the evening the chairman announced the regretted absence of the Association's popular secretary (Mr. Arthur Cox), who had unfortunately met with a motor cycle accident earlier in the day.

The loyal toast having been duly honoured, the company settled down to the enjoyment of a much appreciated musical programme, the various items being interspersed by the toasts, which were again characterised by brevity and good humour.

Three Sides of the Association's Work.

The chairman, in submitting the toast of "The Association," remarked that, although this was their twenty-first year, they would be celebrating their coming-of-age later on in the year. He felt bound to say they had thoroughly justified their existence. Touching briefly on various aspects of their work, he said the three main objects were the fostering of social intercourse, benevolence and business. As regards the first of these he was sure the monthly meetings and lectures were conducive of putting food for reflection into their minds, whilst the benevolent side of their work had been well maintained. They had been successful in helping many an unfortunate overseer who had fallen by the way. On the business side of their activities they had had opportunities of exchanging views to advantage on the latest machinery and appliances. At times some of them might not have in their shops the right class of machine for the particular work in hand, but by an exchange of views they had been able to bring their productions up to the highest standard of efficiency.

The presentation to the six past presidents then took place, the following receiving the gift from the hands of the president: Messrs. F. C. Peacock (president, 1909-12), J. E. Dixon (1913-16), J. Walker (1917-18), A. J. Daines (1919-20), A. W. Hunt (1921-22) and H. Milton (1923).

Replies in appropriate terms were made by each recipient.

President and Vice-President.

The toast of "The President and the Vice-President" was ably given by Mr. J. Walker, who spoke appreciatively of the services being rendered at the present time by the occupants of these offices.

The Ladies.

This toast was again assigned to Mr. A. J. Daines, who, by the introduction of several witticisms, succeeded in contributing a happy little speech.

The Visitors.

Mr. J. Dixon, in submitting this toast, said the Association always laid itself out to make their visitors comfortable and happy on these occasions. He welcomed most heartily Mr. Berry, Mr. Whittle and Mr. Bullett. He would like to say to these three gentlemen that he would like to see the day come when the overseers' associations would be federated. He was sure that if they were greater usefulness would accrue to each of them and to the industry in general. In his opinion, federation had got to come even tually. When they got back to their respective Associations he hoped those he had referred to would take the first opportunity of bringing forward this matter of federation. Mr. Dixon then went on to refer to the past kindnesses of Mr. Geo. Bell and Mr. Frank Colebrook.

Mr. R. H. Berry, who replied, said his Association always referred to the Bookbinders' Association as the sister Association. He did not know quite in which position his Association stood, whether it was that of a sister or an elder brother. The P.M. and O.A. had been in existence for thirty-two years, and during that time it had spread out in many directions, having at the present time no less than nine offsprings. At the Printing Exhibition this year they were holding a two days' conference, when they would be having their family brought together. Referring to federation, as mentioned by Mr. Dixon, Mr. Berry said there were one or two difficulties with regard to it. However, he would do his best to foster the idea, if only for the purpose of showing a bold and united front. He then, in conclusion, dealt briefly with the difficult position of the overseer in his relations with the employer, the worker and the customer.

Mr. Geo. Bell (Winterbottom Book Cloth Co., Ltd.), who also replied, expressed the particular pleasure it gave him to be present.

Mr. E. W. Whittle also responded, and alluded to the questign of federation, saying that though they were not actually federated on the surface, the officials of the three Associations had a perfect understanding of their difficulties, and adopted a friendly attitude towards one another. He congratulated the Bookbinders' Association on the recognition it had made that night of the work of its past presidents.

The toast of "The Stewards" (Messrs. W. F. Cribb and A. J. Daines) was given by Mr. F. C. Peacock, and was responded to by Mr. Daines.

The Artistes.

Musical selections were rendered by the Misses Joyce Flawn (accompanist), Millicent Mitchell and Messrs. Edward Nicol, Will Deller, and Wilfred Stracey (musical director).

Auld Lang Syne brought another memorable evening to a close.

THE MONTHLY MEETING.

Mr. Colebrook on William Blades.

There was the usual good attendance of members of the above Association at the monthly meeting on Tuesday of last week at the headquarters, St. Bride Institute, Bride-lane, E.C., the chair being occupied by Mr. J. Fleming (president), supported by Mr. A. G. Aves (vice-president). At the conclusion of the ordinary business Mr. Frank Colebrook again delighted the members with an interesting lecture, taking as the title of his address, "The Life Work of William Blades."

Following the reading of the minutes, correspondence was submitted from Messrs. F. C. Peacock, A. E. Walters, C.R. Bembridge, R. J. Flint, H. A. Jackson, E. A. Clifford (the Association's honorary solicitor) and F. W. Bridges.

The last letter dealt with the Association's official visit to the Printing Exhibition at the Agricultural Hall, and eventually the meeting decided to fix the date for the function for May 16th.

The next business was to instruct the secretary to send to Messrs. H. A. Jackson and S. C. Baker—two members suffering illness—the Association's sympathy and wishes for a speedy recovery.

The secretary then announced the negotiations being carried on in connection with the Association's annual outing, and said it was proposed to accept the hospitality of Messrs. John Dickinson and make a visit to Croxley Mills on either May 30th or June 6th. In this matter the Association's thanks were principally due to Mr. T. Hill.

The next item appeared on the agenda as "An Investiture!" This business—an interesting innovation in the Association's history—took the form of investing Mr. J. Fleming with a president's collar and jewel of office.

Mr. J. Dixon, in making the presentation, humously alluded to himself as the Association's premier recruiting officer, and on behalf of the Association said it gave him very great pleasure to be called upon to undertake that pleasant task. He was confident Mr. Fleming during his term of office would do his level best to keep the Association up to a high standard of usefulness and efficiency.

Mr. Fleming, in returning thanks, said he felt proud to be the first president of the Association to be invested with a badge of office. It was his intention to uphold the dignity of the Association, and when it came to his turn to hand the badge on he hoped his successor would receive the same loyal support from the members as he had had himself.

The Lecture.

Mr. Colebrook, who was then invited to address the meeting, commenced by saying that enthusiasm for the craft should be more than the mere winning of bread. William Blades, he proceeded, was a shining example of the truth of Lord Bacon's dictum that every man should not only be a debtor to his profession, but that he should by way of amends be a help and an ornament thereunto. He (the speaker) would say that William Blades was not perhaps a great man in the sense of possessing any particular outstanding mental quality, and he had no prominent intellectual characteristic that marked him as a giant amongst men. In this respect he was reminded very much of Charles Knight, who was the splendid pioneer of cheap, good and popular literature at a time when it was dangerous to be a pioneer. Yet each of these men did a great and noble work, their works—like that of all great men—being greater than their deeds. The study of the works of William Blades made men feel greater, just in the same way that, according to Chesterton, the reading of Dickens made them feel greater.

The speaker then proceeded to say that the collection of books—which included some incunabula—got together by Blades from the time he was apprenticed to his father, was unparalleled in America or any other country. He regarded the "Life of William Caxton," published in 1860, as representing the *magnum opus* of Blades' productions. In speaking of a habit peculiar to the famous printer of correcting and throwing doubts on historical dates noticed in the "Life of William Caxton" and other works, Mr. Colebrook said William Blades, without being dominatingly self-assertive, not only exhibited extreme independence but ran counter to received opinions. Blades' "Pentateuch of Printing" and the "Enemies of Books" were next dealt with, and many extracts from the latter concerning printers and binders of the early days proved interesting and sometimes amusing.

Mr. Colebrook next alluded to the passionate interest William Blades at all times displayed for the proper care of books—which Blades thought should be cared for like children—and the vigorous onslaughts he directed against the biblioclasts of his time.

In paying a final tribute to the life work of the famous printer, Mr. Colebrook suggested to his hearers the further study of the works of William Blades. He was confident they would find him a business man who was very much more than a business man. Concluding, he would say that in the days when trades unionism was very much under a cloud it had an outspoken and friendly admirer, as well as a helper and defender in William Blades.

The chairman, in moving a vote of thanks to the lecturer, expressed the debt those present owed to Mr. Colebrook for his interesting and instructive lecture.

Mr. B. J. Sansom, in seconding, said he regretted the general lack of interest shown in the industry in the technical library at St. Bride Institute, which he considered one of the finest of its kind in the world.

Mr. J. Dixon spoke in support of the proposition, which was very heartily accorded.

ABERDEEN PRINTING CLASSES.—On the occasion of the presentation of prizes and certificates gained during the session just closed by pupils of the printing classes conducted by the Aberdeen Education Authority, under the auspices of the Printers' Evening Classes Advisory Committee, a lecture was delivered on Friday evening, in the Central Secondary School, by Mr. William Maxwell, vice president of the Scottish Alliance, and external examiner of the Glasgow printing classes.

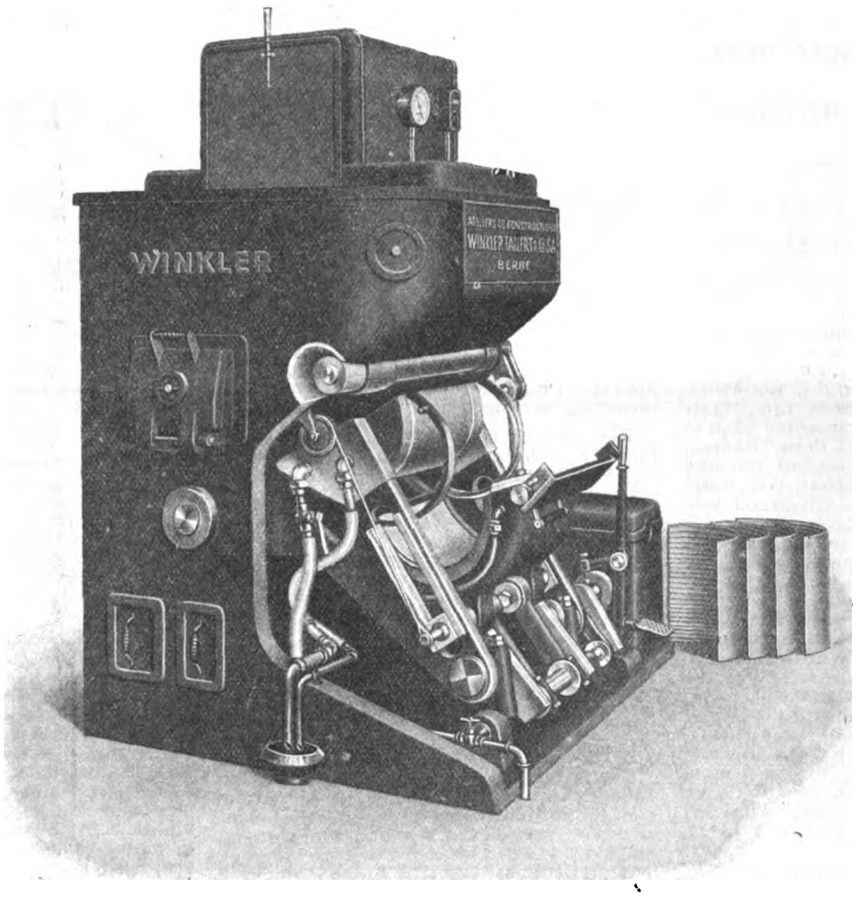
Ward, of 52, Bedford-square, W.C.1, as receiver of the property of Peoples Publishing Co., Ltd., under powers contained in a trust deed dated February 22nd, 1923, securing £140,000 debentures issued.

WHITE HART PRESS, LTD. (London).—H. Rainsbury, of 65-66, Basinghall-street, E.C., ceased to act as receiver on January 16th, 1925.

G. ALDER AND CO., LTD. (paper agents, etc., London).—A. F. Sharp, of 14, Gray's-inn-square, W.C.1, was appointed receiver on August 20th, 1923, under powers contained in debenture dated April 10th, 1923.

BANKRUPTCIES, etc.

Re PERCY THOS. ADAMS (lately trading in partnership as Rowlinson and Adams), printer, stationer and bookseller, 129, Praed street, Paddington.—An application for an order of discharge was made on March 3rd to Mr. Registrar Mellor at the London Bankruptcy Court on behalf of this bankrupt. The official receiver reported that the firm failed in July, 1924, with provable claims £2,241; the assets valued at £862 had realised only £379, and a dividend of 2s. 1d. in the £ was expected to be paid by Mr. Albert Willmott, the trustee. The business was started in December, 1923, with a capital of £675 borrowed from the applicant's father and a friend. The failure was attributed to heavy overhead charges, lack of capital and to the dishonesty of an employee who was now serving a term of imprisonment on a charge of embezzlement. The application was opposed by the official receiver. After hearing Mr. F. C. Slater in support of the application, his Honour granted a discharge subject to judgment for £5 to be satisfied by an immediate cash payment.



Re BLACKFRIARS PAPER MILLS SUPPLY STORES.—A sitting of the London Bankruptcy Court was held on February 18th, before Mr. Registrar Hope, for the public examination of Alexander Cohen, who had carried on business as the Blackfriars Paper Mills Supply Stores, at 39, Blackfriars-road, S.E. The debtor failed in September last, with total liabilities £4,475 (unsecured £4,463) and net assets valued at £331. In the course of his examination, he stated that a previous failure was recorded against him in October, 1920, from which proceedings he was discharged in May, 1923, upon payment of a judgment for £50. From October, 1920, till January, 1923, he bought and sold waste paper for cash and until August, 1922, he also assisted his wife in the business of a waste paper merchant, carried on by her at the premises at which he had previously traded. In January, 1923, with £100 capital, he commenced the present business, and attributed his failure to a slump in trade and ill-health. The examination was concluded.

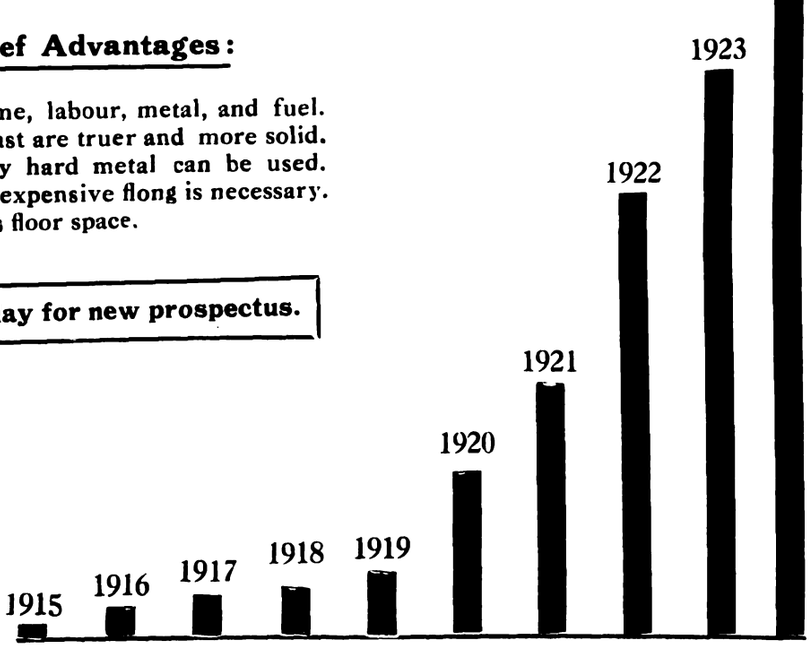
Swiss Manufacture.

Sales in 1924 178 Machines.

THE SALES DEVELOPMENT

of the "Winkler" Automatic Casting Machine

from 1915 to 1924 (as shown in diagram) is conclusive proof of its advantages and efficiency.



Recent orders include :

4 more for "Daily News and Star," London,
2 for "South Wales Daily News," Cardiff.

Chief Advantages:

Saving of time, labour, metal, and fuel.
The plates cast are truer and more solid.
Exceptionally hard metal can be used.
No specially expensive flong is necessary.
Requires less floor space.

Write to-day for new prospectus.

Printers' Managers & Overseers
(PARENT) ASSOCIATION.

"Songs and Singers of the 'Sixties."

Members of this Association spent a very enjoyable evening on Tuesday of last week, when the proceedings were mainly of a musical and entertaining character, the chief item on the agenda being a lecture by Mr. E. H. Berryman on "Songs and Singers of the 'Sixties." The president, Mr. R. H. Berry, was in the chair, and there was a fair attendance of members.

Four candidates for membership were elected into the Association, namely, Mr. W. J. Andrews (Flood and Son, Lowestoft, letterpress machine overseer); Mr. J. E. Borthwick (Alabaster, Passmore and Sons, Ltd., Maidstone, overseer, letterpress machine dept.); Mr. P. Davis ("Central Jail Press," Punjab, manager); Mr. F. W. Gristwood (Sidney-Mitchell, Ltd., 74-76, Fann-street, E.C., overseer, composing dep.). Mr. Gristwood was present, and received a personal welcome from the president and the meeting.

The president drew attention to the preliminary arrangements for the holding of the next P. M. & O. A. United Gathering in connection with the Printing Exhibition which takes place at the Royal Agricultural Hall in May. Mr. E. W. Whittle formally moved, on behalf of the Council, that the Council be empowered to make the necessary arrangements in connection with the United Gathering. This was seconded and carried *nem con.* To co operate with the Lecture and Entertainments Committee in the United Gathering arrangements, six members were elected, namely: Messrs A. Shepherd, J. W. Jarvis, S. A. Dawson, E. Hutchins, E. H. Campling and A. W. Hart.

Old Melodies Recalled.

To assist him in recalling the "Songs and Singers of the 'Sixties," Mr. Berryman enlisted the services of a violinist and a pianist, in the persons of Mr. Alfred Cowley and Mr. Charles Rankin. These two gentlemen played, by way of introduction to the lecture, selections from "The Bohemian Girl" (Balfe) and "Martha" (Flotow), and afterwards, during intervals in the lecture, played selections from "The Grand Duchess" (Offenbach) and "Maritana" (Wallace) as well as a number of the songs mentioned by the lecturer. Their efforts were heartily applauded.

Mr. Berryman's lecture was an out-of-the-ordinary contribution to a P. M. & O. A. meeting and was such as to win a very cordial reception from all present, most enthusiastic in their approval being the more elderly members who could best appreciate, from personal recollection, many of the songs and singers referred to. The lecturer made no attempt at oratory, but gave forth in a homely, intimate way from the stores of his musical memories; and his story, full of information and illumined throughout with touches of humour, emotion and philosophy, was all the more appealing for the simple fashion of the telling. Annie Adams, Kate Santley, Nelly Power, William Harrison and Louisa Pyne, Signor Folio and Herr Ludwig, Sims Reeves, Charles Santley, Henry Russell, Frederic Maccabe, Harry Clifton, E. W. Mackney, Arthur Lloyd, the Great Vance, George Leybourne—these and others were dealt with and their songs recalled, with many an interesting anecdote and comment, the whole making a lecture both informative and entertaining.

At the close, the president expressed his personal enjoyment of the lecture, suggesting that Mr. Berryman might later give the Association a "second edition" of his musical recollections.

A very cordial vote of thanks was given to Mr. Berryman, on the proposition of Mr. Whittle, Mr. J. Acton seconding, and Messrs. W. Hermon Gill, J. Stevenson, and S. A. Dawson speaking in support.

At the call of Mr. Berryman, the artistes were heartily thanked for their services.

SIZE OF POST CARDS.—Intimation has been received by Sir Adolph Tuck that there is to be an increase in the permissible dimensions of post cards (the maximum size of which has been 5½ in. by 3½ in.) as from October 1st next. Sir Adolph has called a meeting of picture post card publishers to consider this unexpected decision.

Trade Notes.

OFFER was made over the week-end of 65,000 ordinary shares of £1 each, at par, in Henry C. Stephens, Ltd., proprietors of Stephens' Inks.

MULTIGRAPHS AND THE FACTORY ACTS.—In a written Parliamentary answer to Mr. T. E. Naylor, M.P., Sir William Joynson-Hicks, Secretary of State for Home Affairs, states:—"I am advised that the processes now in use for multigraphing by means of machines set with types are forms of letterpress printing and that any premises or room in which any such process was carried on regularly and to a substantial extent would come within the definition of letterpress printing works, which are expressly included in the Act. The factory inspectors have been instructed in this sense."

THE death occurred on Thursday at Knutsferd of Mr. Thomas Eli Gibson, late of Crewe and Warrington, and for many years general manager of Messrs. Mackie and Co., Ltd., proprietors of the *Warrington Guardian* series of newspapers, aged 84.

A PRINTER named Harrison was knocked down by a taxi-cab on Blackfriars Bridge, London, on Saturday night. He was taken to St. Bartholomew's Hospital, where he died an hour later.

MR. J. J. RILEY, who died at his Darwen residence on Sunday night at the age of 74, was the proprietor of a number of newspapers, and was a well-known member of the Newspaper Society.

THE late Mr. Henry Samson Clark, of Brondesbury, chairman of Messrs. Samson Clark, Ltd., advertising agents, of Mortimer-street, W., who died at Mombasa on February 9th, aged 56, left estate of the gross value of £91,747, with net personalty £18,668. Amongst bequests were £500 to the National Advertising Benevolent Society; £100 each to Mr. William Beveridge Robertson, advertisement manager of the Amalgamated Press, Ltd., and Mr. George Scott, advertisement manager of the *Glasgow Herald*, as executors; generous gifts to colleagues and many small gifts to employees.

CHESTER MASTER PRINTERS.—The third rally of the North Wales Master Printers' Alliance was held at Chester on Monday. Mr. W. Powlson, president of the Alliance, who occupied the chair throughout the day, extended a welcome to the president of the Federation of Master Printers, Mr. W. B. Wykes. A business session in the morning was followed by luncheon, and the afternoon was devoted to a consideration of the Federation Costing System, an address on the principles of which was given by Mr. A. D. Hull, one of the Federation cost accountants.

THE North London Master Printers' Association is to hold its annual bohemian concert at Wortley Hall, 242, Seven Sisters-road, on Tuesday the 17th inst. at 7.30.

AN exhibition of woodcuts by Mr. Robert Gibbings and Mr. Eric Daglish was opened on Friday at the Redfern Gallery. Mr. Gibbings is a director of the Golden Cockerel Press.

Trade Union Matters.

L.S.C. ANNUAL MEETING.—The seventy-seventh annual general meeting of the London Society of Compositors was held on Wednesday of last week at the Memorial Hall, Farringdon street, the chair being occupied by Mr. T. Timberlake. The annual report and balance sheet for 1924 were presented, and after various questions had been put to the general secretary and replied to, were formally adopted. An examination of the report shows that at the end of the year the Society's funds stood at £161,475, a figure which indicates an increase of £20,367 on the preceding year. With regard to superannuation a sum of no less than £83,743 was paid out during the year to 1,219 superannuated members. The funds of the Society now stand at an average of £11 4s. 4¾d., as against £4 6s. 0¾d. per member ten years ago. The membership of the Society now stands at 14,570. The following were amongst those re elected to the more important offices for the ensuing twelve months: Mr. T. Timberlake (chairman); Mr. T. E. Naylor (general secretary); Mr. F. A. Davies (assistant and organising secretary); Mr. C. E. Coveney (financial secretary). Mr. Len Turnbull was elected to the position of treasurer, in place of Mr. G. Jones, who has retired on superannuation.

MACHINE COMPOSITORS' VIGILANCE ASSOCIATION.—Mr. J. F. D. Dixon (chairman of the Association) presided at the eighteenth annual general meeting of the Machine Compositors' Vigilance Association at Essex Hall, Strand, London, on Friday. The report of the committee, presented by Mr. A. Henwood (secretary), recorded that the members of the Association number 1,064 and include 249 Monotype and 739 Linotype operators, in addition to 16 Monotype and 60 Linotype honorary members. The balance sheet showed that receipts (subscriptions £585) had totalled £748, while the expenditure reached £506, leaving a balance on the right side of £242 for the twelve months. The Association's funds now stood at £1,698. Officers and committee were elected as follows: Chairman, Mr. J. F. D. Dixon; treasurer, Mr. A. E. G. Goldwin; auditors, Messrs. J. M. Bannochie and W. Groves; secretary, Mr. A. Henwood. Committee: (Monotype), Messrs. A. J. Clarke, H. A. Cannon and H. E. Waite; (Linotype), W. A. Barnes, R. A. Berry, W. Blackburn, H. H. Dovey, C. R. Flaxman, A. C. Hall, B. R. Ingram, H. Lineman and D. C. Luya.

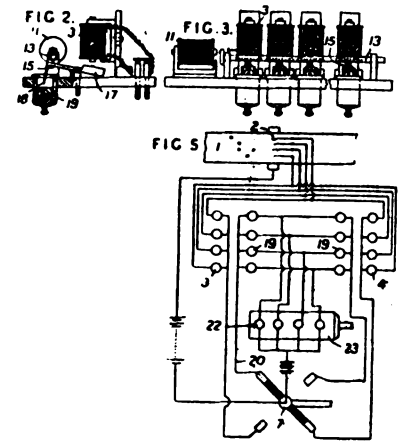
New Inventions

Rotary Offset Machines.



Under a patent by Messrs. Linotype and Machinery Limited, and Mr. B. J. J. Goulding, lithographic printing machines are provided with apparatus for applying a protective coating of gum to the printing surface prior to stopping the press, the apparatus comprising a power operated roller having an operative surface of absorbent resilient material receiving gum from a trough, and means for bringing the roller into and out of contact with the printing surface. In a machine, such as a rotary offset press, having a number of plate cylinders each equipped with the gumming apparatus, means may be provided fo

operating the gumming apparatus collectively or individually. A special cleaning apparatus may be provided for removing the gum on restarting the machine. A gum-applying roller 6 continuously contacts with a roller 3 rotating in a gum trough 2 and driven by bevel gearing 40, 41 from a shaft 42. The roller 6 is carried in a pair of arms 5 which may be rocked about the axis of the shaft of the roller 3 by a hand lever 7 to move the roller 6 into and out of contact with the plate on the printing cylinder 1. To allow the rollers 6 of a number of plate cylinders to be operated simultaneously, the levers 7 are connected by spring plungers 8 to vertical rods 9, connected by linkage to a hand lever arranged adjacent to the folding mechanism of the machine. Individual operation of any of the gumming rollers may be effected by withdrawing the corresponding plunger 8. A thin coating of gum may be removed by the ordinary damping apparatus, but for thick coatings, a special cleaning apparatus is provided comprising a pair of rollers 19, 20 in continuous contact with a roller 17 rotating in a trough 16 of cleaning fluid and driven by gearing 38, 39 from the shaft 42. The rollers 19, 20 are mounted in arms 21, 22 pivoted about the axis of the roller 17 and connected by links 23, 24 to a double armed lever 25 on a shaft 26 provided with a hand lever 28. Depression of the hand lever 28 moves the rollers 19, 20 into contact with the plate cylinder. Collective and individual operation of the cleaning apparatus may be effected by connections similar to those employed for the gumming apparatus. To allow the rollers 3, 17 to be stopped when the machine is running normally, the shaft 42 may be disconnected from the driving shaft 44 by a clutch 43. The rollers 6, 19, 20 may be reciprocated axially, and the control of the gumming and cleaning apparatus may be associated with that of other organs of the press. Foot-operated devices may be employed instead of hand levers for operating the rollers. The Provisional Specification describes a pin and slot connection between the levers 7 and rods 9, and states that the means for simultaneously operating the gumming rollers may be interconnected with mechanism for stripping the cylinders or the inking and damping rollers, or for stopping the web-feeding apparatus. It also states that pads may be employed instead of rollers for the gumming apparatus.

Photo-Composing Machines.

An invention by Messrs. J. R. C. August and E. K. Hunter relates to electrical relay arrangements for operating photo-composing, type-justifying, and like machines of the kind in which two banks of relays for controlling the operated parts are alternately put into action by keys or a perforated strip. A keyboard or equivalent means, such as a perforated strip 1, Fig. 5, closes by means of brushes 2 the circuits of two or more banks of electromagnets 3, 4 of which the armatures 17, Fig. 2, carry pins 18 adapted to dip into contacts 19. The contacts 19 are located in a series of operating circuits 20 connected with the electromagnets 22 of a setting mechanism 23, such as that described in Specifications 200,127, 210,355, and 219,745. In series with each bank of magnets 3, 4 is a locking magnet 11, Fig. 3, which attracts a sliding rod 13 carrying locking hooks 15, whereby the armatures of the magnets 3, 4 are first released and then locked in set position. The circuits of the magnets 3, 4, and also the operating circuits 20, are controlled by an automatic reversing switch 7, so that during

the setting of a signal on one bank of the magnets 3, 4, the operating circuits of that bank are broken, and the operating circuits of the other bank, the contacts 19 of which have been previously set and locked, are closed, so as to actuate the magnets 22. Specifications 195,104, 200,046, 200,047, and 200,532 also are referred to.

THE death has occurred of Mr. James Mackay, of Chatham, one of the directors of Messrs. W. and J. Mackay and Co., Ltd., printers and publishers, and proprietors of the *Chatham and Rochester Observer*. He died, following an operation, in a nursing home at Chatham, at the age of 72.

IN connection with the establishment of exhibitions for courses for journalism at the University of London, donations amounting in all to £1,000 are announced, the donors including several prominent newspapers and organisations connected with the newspaper industry.

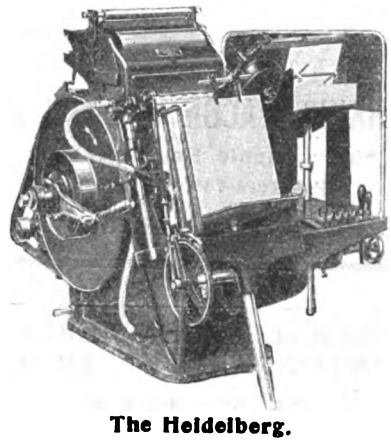
THE *Bombay Chronicle* has changed hands, and it is understood that Mr. N. H. Belgaumwalla, proprietor of the *Voice of India*, is the new owner, acting on behalf of a syndicate. Mr. Belgaumwalla will be managing director of the *Bombay Chronicle* and the *Voice of India* will be incorporated with it.



MR. HENRY G. BURGESS, 139, Queen Victoria-street, London, E.C.4, has been appointed the sole agent for the well-known mill of Messrs. R. Sommerville and Co., Ltd., Creech St. Michael Paper Works, near Taunton, for London, Eastern and Southern counties.

MR. JOHN E. MOSS, 22, Ivy-lane, Newgate-street, London, has been appointed sole representative in London and Southern Counties for the Richmond Hill Paper Works Co., Ltd., Blackburn. The mill makes krafts, straw paper, grocery caps, browns, mill wrappers, etc. The mill's machine is 76 in. wide.

An Automatic Platen Press.

Among the smaller machines in the printing office the platen press takes an important position, as, in most offices, vast quantities of work are run on it that could not be easily handled on a press of larger type. The platen being so popular, and in small offices so essential to the turning out of every-day work, the printer is naturally interested in any improvements that may be made in this class of printing press with a view to increasing the output and cheapening the cost of production.

The latest thing in platens offered to the British printer is the "Heidelberg," an automatic machine that feeds and delivers at a high rate of speed, and that is claimed by the manufacturers to be able to deal with all classes of paper from thin tissue to cards. The machine is very strongly constructed, the

The Heidelberg.

frame being of one single casting, and designed to meet the heaviest strain that may be put on it, and the swinging platen is a solid rigid casting, the shafts and other running portions of the machine being of steel, and working in phosphor bronze bearings of ample dimensions. The impression mechanism is well designed to give an even and firm impression, and to allow an appreciable dwell that insures freedom from slur. The fly-wheel runs in ball bearings; the drive can be effected from either shafting or independent motors, and a feature of the machine is its perfect steadiness when running, the vibration being so negligible that it is quite unnecessary to bolt the machine to the floor.

Considerable attention has evidently been paid to the inking portion of the apparatus, which consists of a large polished steel reciprocating cylinder, two distributors and a steel reciprocating rider in conjunction with a vibrator to the adjustable duct cylinder. Two large forme rollers with an additional steel rider, which serves as an ink reservoir, transmit to the forme ample inking for the heaviest class of jobs, and can be regulated to suit the lightest also. The feeding arrangements are simple. The pile of paper is placed in position, and, when the machine starts, the suction feeder comes into operation, automatically taking the top sheet and laying it exactly in position. After the impression the sheet is taken off automatically and laid on a receiving table at the side of the press. The feeder is capable of adjustment for different thicknesses of paper, and at the time of our representative's visit a number of the machines were running, the feeding and delivery going on quite automatically. Thete is no trouble about making ready, the platen and bed being quite accessible to the operator, who may be in charge of two or three machines.

The press is made in foolscap folio size (9½ by 13½ inches), and is worked at a speed of 2,500 per hour, whilst smaller work, such as cards or envelopes, may be worked two at a time, which doubles the above output. As originally put on the market, the price of the "Heidelberg" was £175, but this has now been increased to £185, as several improvements have been added that make for the machine's efficiency, such as a sheet counting apparatus, an additional steel rider to the inking rollers and a special brake feed control. The machine is quite simple in construction, and as the feeding is entirely automatic there is no danger of injury to the operator's hands, whilst the increase in output is a matter that will be appreciated by every printer who has long runs of small work.

A whole battery of these machines may be seen at work any day at 26, Long-acre, W.C.2, and printers interested should investigate the merits of the press for themselves.

The World's Printing Trade

NEARLY forty years ago "The British and Colonial Printer and Stationer's" Special Quarterly Export Issues were started, to cover the World's Printing Trade.

These special issues were almost instantaneously successful, and to-day "The British and Colonial Printer and Stationer" stands pre-eminent as the printing trade journal, carrying the message of British Print throughout the world.

Without exceeding the bounds of modesty, we can legitimately claim that this journal has made the export departments of certain firms, whilst it has increased the overseas business of its advertisers generally.

It is not for us to presume to instruct supply houses their method of doing business—we can only give you the experience of our advertisers:—

> "It will no doubt interest you to learn that during the past few years we made considerable additions to, and have extended our Export Dept. We thank you for the assistance that your Journal has contributed towards this export business.—C. B., Ltd."

"The British and Colonial Printer and Stationer" specially circulates in the following countries:—

Australasia.	East Indies.	Canada.
India.	West Indies.	United States.
South Africa.	China.	South America.
	Japan.	

The next Special Export Issue will be published on March 19th, 1925.

One of our representatives will be pleased to call upon you at your office, in your time and at your convenience. He is entirely at your disposal, and a conversation can do no harm.

Write us to-day!

THE BRITISH & COLONIAL PRINTER AND STATIONER

FOUNDED 1878. PUBLISHED WEEKLY.

WITH MONTHLY SECTION FOR THE BOOKBINDER.

The Recognised Organ for Printers, Printers' Engineers, Wholesale and Manufacturing Stationers, and Makers of Machinery and Appliances for the Paper Bag, Envelope, Box-making, Bookbinding and all Paper and Board Consuming Industries.

VOLUME 96. NUMBER 12. [REGISTERED AS A NEWSPAPER.] LONDON: MARCH 19, 1925. Special Export Issue. 4d.

Evolution

WE are told that one thousand million years ago the world in which we live was a ball of flaming fire hurtling through space. It is left to the caprices of our imagination to say what happened to this belching furnace of lava until life came.

We do know, however, that since the beginning of time every living organism has contributed something to the progress of life. In the world we know to-day—in commerce, in our own little world of printing—every unit contributes to the harmonious working of the whole.

The House of Winstone have played no small part in the world of printing. They have worked faithfully in the interests of their craft, producing better printing Inks, Rollers, time-labour-and-cost-saving specialities and sundries during their four-score years of life.

Progress Series.—No. 3.—The Earth is one of the smallest of a thousand million worlds travelling at a terrific speed around the Sun. The Earth goes round the Sun once a year (1,000 miles a minute), but Neptune, the planet farthest removed from the Sun, makes its circuit only six times in 1,000 years.

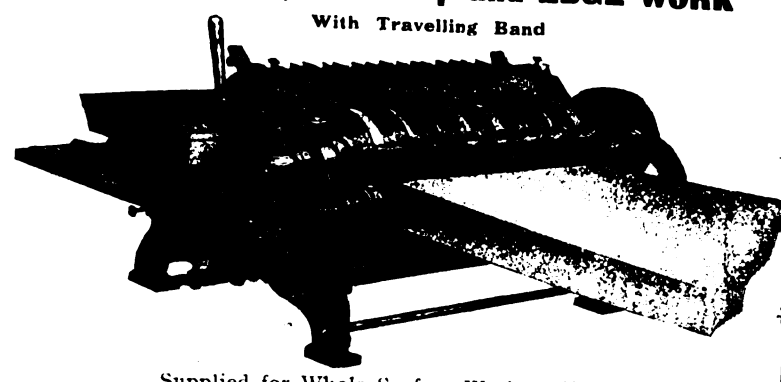
THE "ST. GEORGE" MACHINES

(TRADE MARK) (ALL BRITISH MAKE).

For Glueing, Gumming, Pasting, Varnishing, etc.

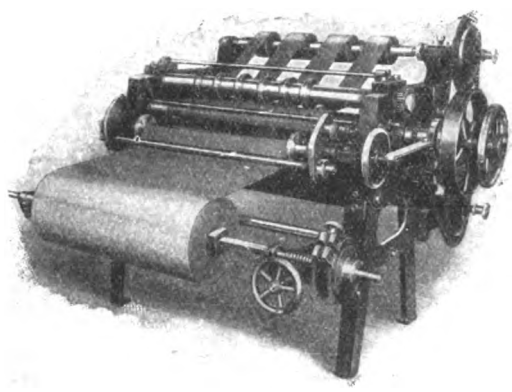
We Manufacture the Largest Range of Types & Sizes, for all Purposes, for all Trades.



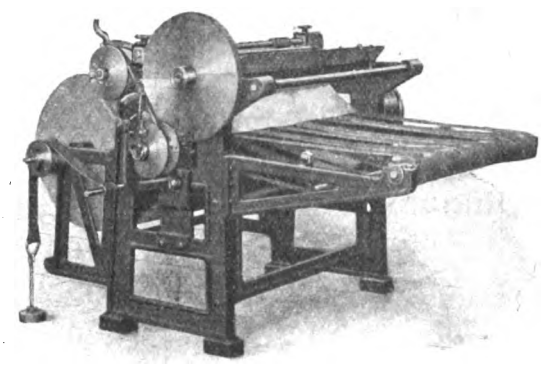
Type A for WHOLE SURFACE WORK.

Supplied for strip work as Type C.

Type A4, for Strip and EDGE WORK



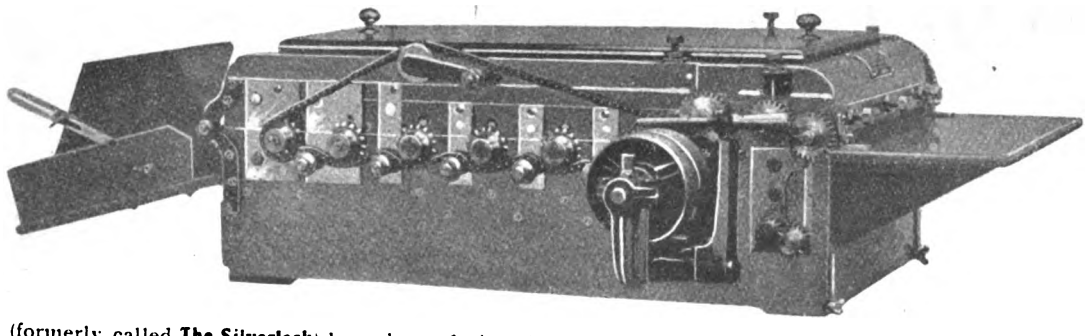
With Travelling Band



Supplied for Whole Surface Work as Type A1.

SOME USEFUL MACHINES for BOX MAKERS, PAPER MAKERS and the TEXTILE TRADE

Slitting and Rewinding Machines as Shown, also Surface Rewinding



Sheet Cutting Machines from the Reel, also as Combined Slitter and Sheet Cutter

The most Original and Adaptable Bronzer yet produced.

Made in Six Sizes: 7 ins., 15 ins., 16 ins., 24 ins., 32 ins., and 40 ins. wide; will take any length.

COMPACT,
The illustration *proves* it. It will Bronze, Burnish & Dust most work in one operation and takes such little space and power.

ADAPTABLE
Can be placed in the centre of a group of machines; with a girl to feed it, it will often keep all machines going. Can be moved from one department to another.

These Machines (formerly called **The Silverlock**) have been designed with just the required amount of mechanism to produce work unsurpassed by any other make. WHY pay for unnecessary machinery to do the same job? Consider the advantages offered. Saves POWER, SPACE and CAPITAL. Costs little for upkeep. Tackles any Job from Thin Paper to Thick Card.

We are manufacturers in addition of a fairly wide range of machinery suitable for all the various branches of the Trade, including :—

Rotary Cutting Machines.
Rotary Cutting and Scoring Machines.
Rotary Scoring for hand or power.
Vertical Bending Machine.
Millboard Cutting 24 inches to 56 inches.
Small Card Cutters from 6 inches to 24 inches.
Bevel Card Cutter.
Tube Making Machine.
Sheet Cutting Machines.
Rule Cutting and Bending Machines.
Treadle Perforating Machines.
Relief Stamp Presses.
Nipping Presses.
Hole Punching Machines.
Round and Square Corner Cutting.
Showcard Edging Machine.
Slitting and Rewinding Machine.
All Steel Waste Paper Balers.

Cutting Bindery Costs—

WHEN you have investigated everything, and you find that it is not the press room or the composing room that is running up your production costs, it would be well to turn you attention to the bindery. See whether the leak does not lie in that section which is every bit as important as the machining—the folding department.

There are dozens of wasteful ways of running a bindery. One of them is hand folding. Another is using old-fashioned folding machines that are slow, inaccurate and capable of handling only a portion of the work, causing belated deliveries and constant recourse to hand folding to help them out.

There is one absolutely efficient and up-to-date way of running a bindery, and that is by installing a Camco Cleveland Folding Machine. The Cleveland Folder will handle all the ordinary folding that comes to the bindery, handle it much more quickly and will give absolute accuracy.

Further, the Cleveland will handle scores of different folds that other machines will not touch, and which hitherto you were compelled to fold by hand or refuse. Thus, you get vastly increased output, you are able to turn out the work to time, and to turn it out in so perfect a manner that the repeat order comes to you. Furthermore, you can go to your customer with suggestions for novel folds that will bring you the business, because it was your suggestion, and only the Cleveland user can make the fold economically.

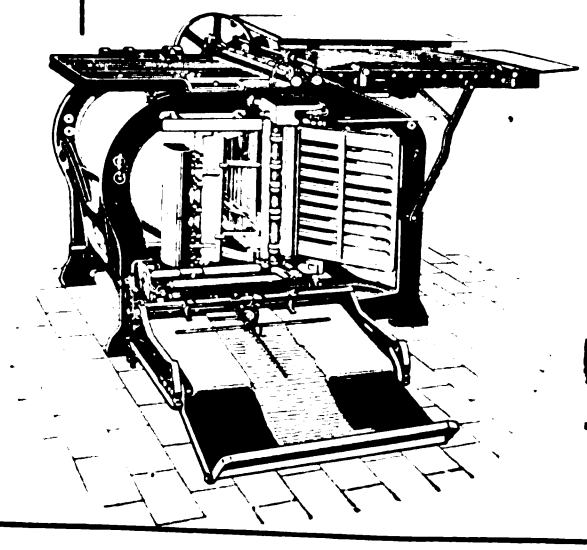
The Cleveland is not only fast, accurate and versatile. It is simple to operate, and exceedingly reliable. It never lets you down.

The Camco Cleveland is a gilt-edged investment. It is costing you money to be without a Cleveland Folder.

The Type "B" Camco-Cleveland Folder—*as illustrated. Maximum sheet on right angle work 30 in. by 40 in., on parallel work 30 in. by 65½ in. Folds 210 different forms.*

The Crown Camco-Cleveland Folder—*Maximum sheet: right angle 15 in. by 20 in., parallel 15 in. by 28 in. Folds 26 different forms, (up to four folds).*

The Type "E" Camco-Cleveland Folder—*Maximum sheet: right angle 20 in. by 27½ in., parallel 20 in. by 33½ in. Folds 55 forms.*



The Quad Royal Camco-Cleveland Folder—*Maximum sheet: 40 in. by 50 in. Same folds as Type "B."*

The Eight Crown Camco-Cleveland Folder—*Maximum sheet: 40 in. 60 in.*

The Camco Medium Folder—*Maximum sheet: 18 in. by 23 in. Four folds, i.e., up to 16 pp. upright and 32 pp. oblong. Speed 3,600 sheets per hour. Very quick change.*

The Camco Demy Folio Folder—*Maximum sheet: 13 in. by 20 in. One or two parallel folds. Change over in one second. Speed unlimited.*

THE BRITISH & COLONIAL PRINTER AND STATIONER

FOUNDED 1878. PUBLISHED WEEKLY.

WITH MONTHLY SECTION FOR THE BOOKBINDER.

The Recognised Organ for Printers, Printers' Engineers, Wholesale and Manufacturing Stationers, and Makers of Machinery and Appliances for the Paper Bag, Envelope, Box-making, Bookbinding and all Paper and Board Consuming Industries.

VOLUME 96. NUMBER 12. [REGISTERED AS A NEWSPAPER.] LONDON: MARCH 19, 1925. Special Export Issue. 4d.

Export Notes and Comments

Export Trade Hopes.

"THE signs are propitious for an extension of business," said Mr. Reginald McKenna (chairman of the Midland Bank) recently, and in this optimistic utterance he was voicing an opinion that is widely held amongst bankers and others who have their fingers on the industrial and commercial pulses of the nation. The President of the Board of Trade and the Parliamentary Secretary of the Overseas Trade Department are amongst those who have lately expressed themselves definitely as to the brightening of the trading outlook. It is true that New Year hopes have, in the last year or two failed to realise themselves fully as the months have worn on, but there are clear indications that every year now does mark a step forward towards increased prosperity. One firm ground for optimism in respect of export trade is to be found in the steady movement of the foreign exchanges towards stability, whilst the rehabilitation of the pound sterling is another factor that must mean increased confidence and better business. The latest Board of Trade returns, moreover, are distinctly encouraging, exports as a whole maintaining the gradual advance which has been proceeding for the last five or six months. Such figures as relate to goods in the category of paper and print show that a bigger increase of export business has occurred in our own industry than in the country's trade as a whole. Thus British suppliers who desire to extend their connection with the printing and allied trades overseas can exert their best efforts with the encouraging thought that the auspices are favourable.

Printing Machinery in Canada.

ENCOURAGING reports come to hand concerning orders for printing machinery in Toronto, and it is probable that this state of things is more or less common to other areas. The early months of the year indicate improved prospects in this line, and since the movement concerns new as well as re-built equipment, it indicates that operations in printing houses are in a fair condition. Under the influence of sounder business conditions, printers stand a chance of placing their industry upon a better footing. They are beginning to realise the importance of the fact that a fair price for their products is the only safe basis on which to do business; nevertheless, there is still considerable price-cutting going on. A better demand for good printing is the great essential, but this will not come where the tendency is toward cheapness and when price rather than quality becomes the main consideration. It is felt that the buyer appreciates the fact that quality costs money, and realises, too, that his message to customers lowers the tone of his product if presented through an indifferent medium. This trend towards quality will mean much to the Canadian printing and publishing industry if it is well maintained. Machinery houses, therefore, look for a better demand for modern equipment in 1925.

Opportunity for English Houses.

THIS improvement in the Canadian printing industry offers an excellent opportunity for English houses to pick up some useful business. Already, it is stated, some of them have shown an increased inclination to cultivate contact with the market in the Dominion. Skilful and persistent salesmanship, however, is necessary to secure custom. Naturally competition is very severe, both from local and United States firms, which possess special advantages arising from proximity. Canada, however, is a growing country; and as she develops her resources her demand for printing and printing plant must increase. Therefore her market is worth studying.

Australia's Satisfactory Position.

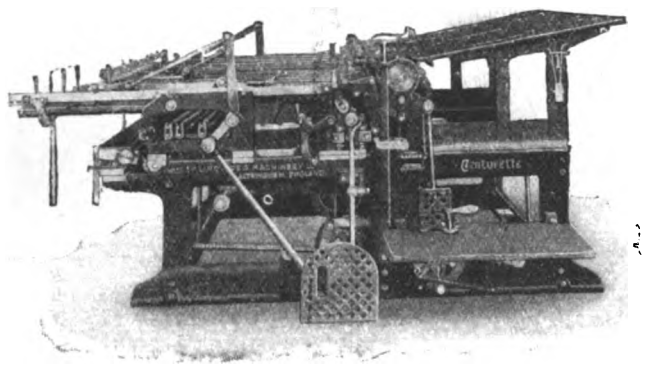
THOSE who look for trade with Australia in supplying the needs of printers have every reason to regard the future with confidence. Australia has suffered less than almost any other country in the aftermath of the war; its finances have been shown to be healthy, and its conditions have practically attained the normal as regards production. There are many signs of increasing prosperity, and British manufacturers have special opportunities to share in the business revival. Strong pro-British sentiment, finding expression in preferential treatment for British goods, gives our traders a big pull over their many competitors, and exporters of supplies connected with the printing trade should not overlook the possibilities of markets in the antipodes.

Business Conditions in New Zealand.

STATISTICS concerning the trade of New Zealand show encouraging development. From this it may be gathered that the country is in a sound condition, and that the trades connected with paper and print should benefit. There is every prospect of a greater demand for printing arising from these conditions, especially as in the first six months of 1924 the total trade of the country reached a higher figure than in any previous corresponding period. With this growth in trade and in the consumption of printing, there is a demand for the plant and supplies which the printer uses. There would here appear to be an opportunity for British supply houses, particularly in view of the fact that in the Dominion a very strong prejudice exists against the use of German goods, which are imported only in comparatively small quantities.

The South Seas Exhibition.

A FILLIP to business in the Dominion is expected to be given by the New Zealand and South Seas Exhibition which is to be held later in the year. United Kingdom firms are supporting the event with considerable ardour, and up to a recent date more than 50 of them had definitely taken space. The large amount of publicity work which will be required to be undertaken in connection with the exhibition should make a big demand upon the printing presses of the country, and it must not be forgotten that in all branches of printing New Zealand sets a very high standard.



New Zealand Paper Market.

The total value of the imports of paper into New Zealand during 1923 represented £1,096,875, a figure that was 50 per cent. higher than in the preceding year. The share of the Mother Country in last year's shipments to the New Zealand market represented 51·8 per cent. of the total, compared with only 39 per cent. of the 1922 total. This satisfactory improvement has been chiefly due to the great progress made in supply of printing paper, and to a less extent to the increased share obtained of the trade in paper-hangings and writing paper. Stationery imports were valued at £834,278, against £702,590 in 1922, the United Kingdom's share in the two years being £609,888 and £499,616.

South African Printers and a Tariff.

MASTER printers in South Africa continue to make serious efforts to protect their industry from overseas competition. From all accounts it would appear that a considerable amount of printed matter enters the country which might well be done at home, and an agitation for some form of protective tariff was put forward in the hope of retaining in the country a larger proportion of the local requirements. To this end a deputation from the Federation of Master Printers recently waited upon the Board of Trade and Industries at Pretoria. The request submitted was that an all round

Digitized by Google

The Centurette, made by Linotype and Machinery Limited at Altrincham, Cheshire, is size for size the fastest Two-Revolution machine on the market.

It prints Double Demy at 3,000 per hour, and the quality of the work is above that usually obtained from a two-roller machine.

This result is obtained by the excellence of the engineering work put into this press.

Many Centurettes are in use for colour work.

It is made in two styles—(1) with printed-side-up delivery as illustrated above, or (2) with fly delivery.

Fuller details will be forwarded on application to

LINOTYPE & MACHINERY LTD.
9 KINGSWAY, LONDON

tariff of 50 per cent. *ad val.*, or 9d. per lb., whichever might be the greater, should be placed on all printed matter entering the Union, whilst certain items used as raw material by the printing industry should be allowed to enter the Union free. Following the deputation, a memorandum was drawn up at the request of the Minister setting forth the reasons for the demands made. This memorandum referred to the high percentage of Europeans now engaged in the printing industry and to the conditions of the industry in regard to employment and wages. Figures were given to show the divergency in the wages and hours prevailing in England and in South Africa. According to the calculations made, the difference in cost for skilled labour was 100 per cent. and for semi skilled labour 53 per cent. to the disadvantage of the South African printer. On a comparative basis it is shown that material which in England cost £30 is valued at £33 15s. in South Africa, while labour costs £40 in this country and £72 in South Africa. The respective overhead costs are £30 and £45, the total difference on these three items being just over £50 or 50¾ per cent.

Manufactured Stationery.

THE question of manufactured stationery is taken into consideration in relation to this question, and the *South African Printer and Stationer* in discussing the problem cites some interesting figures. It is pointed out, for example, that a single ruled and printed account book costing £4 12s. 6d to produce in South Africa would cost £3 2s. in England, and the 50 per cent. tariff would bring this up to £4 13s., or just sixpence higher than the South African cost. If, on the other hand, the oversea order was for ten books, the cost per book, including tariff, would be £3 3s. 9d., and there would still be many buyers who would compare this price with the South African price for a single book. It would be up to the South African printing industry to convince the buying public that it was to their interest to place their local orders in the same quantities as they placed them overseas, which had not been the practice in the past. In this instance the cost per book in quantities of ten would be: South Africa £3 2s. 6d, England (including tariff) £3 3s. 9d.

Difficulty of Definition.

THE difficulty of specifying any class of manufactured stationery which might be exempted from the full tariff suggested is recognised. The term, it is pointed out, includes any class of printed or ruled goods manufactured in advance of actual requirements, and therefore it would be dangerous to the industry to attempt to define it or to provide for the exemption of any class of printing under this heading. Wherever the printing industry enjoyed the advantages of a large market, they were able to specialise and turn almost any kind of printing into "manufactured stationery." In America there were mail order catalogues produced by the million in advance of actual orders, and dealers were able to buy these in small quantities, with a special cover, and then purchase stocks to fit the catalogue. In Great Britain many of the seed catalogues were produced in the same way, as well as many lines of drapers' catalogues, folders, leaflets, etc. The same practice obtained in other countries. To make exemptions to the tariff schedule for stock ruled books, pass books, writing pads, etc., simply on the grounds that they were

produced in large quantities overseas, would be discriminating unfairly and opening avenues for an unlimited number of exemptions. There were many firms in South Africa capable of turning out the lines of goods now imported under the heading of manufactured stationery, and with the protection asked for would be able to keep their plants going during otherwise slack seasons, thus reducing the cost of production all round, and ultimately bringing down the price to the consumer.

Imprint Suggestion.

In addition to the demand for a protective tariff, a request was made that on all classes of printing entering the Union, an imprint should appear on each sheet or article showing the country in which it was produced. Apparently, however, printers have not much hope of an Imprint Bill being introduced as a Government measure owing to pressure of other business, but it is thought that an opportunity might occur for an Imprint Bill to be accepted and discussed as a private measure.

Penny Postage in South Africa.

At the same time as the British printing industry is agitating for a return to penny postage in this country, a similar movement is on foo in South Africa. As a matter of fact, on the very same day as the deputation from the British Chambers of Commerce waited upon the Postmaster-General in this country, by a remarkable coincidence a similar deputation from the South African Chambers of Commerce was urging like claims on the Minister of Posts and Telegraphs in the Union. Apparently the same reasons for not giving ready assent to the demand were advanced in both cases. In South Africa the Minister for Finance is reluctant to allow a reversion to penny postage on the ground that it would entail an annual loss of £400,000. The Postmaster-General himself favours a return to penny postage, but, as is the case in the United Kingdom, problems of finance stand in the way.

The Indian Market.

Whilst one special branch of British export trade with India suffers by the recent Government decision to have Indian security printing done in India instead of in England, this should not be taken as being in any way a general indication that export possibilities are on the wane in respect of the Indian Empire. Rather may it be taken as a sign of the approaching industrial development which will some day make India the possessor of industries much more capable and vigorous than those she as yet can boast. Despite political difficulties, India's commercial position is more or less steadily improving, and the prospect to-day is quite a promising one for the British exporter. The political and racial feelings which were so acute in the bazaars in 1921 and 1922 have now subsided, and Indian dealers are anxious only to expand their trade and so recover the losses they made during the "slump." When one considers this, in conjunction with a greatly improved economic situation and the likelihood of a continued firm exchange, it is possible to sound a hopeful note as to the near prospects of Great Britain's most valuable export market

India's Paper Imports.

India's recent purchases of paper supplies indicate not only the big field that exists in this direction, but also the importance of Germany as a competitor for export business. A report on the import trade of India from April 1st to September 30th has been furnished to the Department of Overseas Trade by H.M. Senior Trade Commissioner in India (Mr. T. M. Ainscough, O.B.E.). There has been an improvement all round, in which packing and printing paper has shared. Writing paper and envelopes, however, were not so favoured. With regard to packing paper, the total trade expanded from Rs.8 to Rs.13½ lakhs in value. The United Kingdom supplied only Rs.2 lakhs worth, whereas Germany shipped Rs.5½ lakhs, Sweden Rs.2 lakhs and Norway nearly a lakh. In printing paper also there has been an expansion in the total trade from Rs.44 to Rs.61 lakhs. British shipments rose from Rs.10 to Rs.18 lakhs, but those from Germany increased in greater proportion, from Rs.9 to Rs 19 lakhs. Norwegian imports fell from Rs.11 to Rs.9 lakhs. The total trade in writing paper and envelopes declined slightly from Rs.30 to Rs.28 lakhs. The British share fell from Rs.20 to Rs.17 lakhs, but Germany increased her shipments from Rs.3 to Rs.5 lakhs.

Papermaking in India.

Since the Tariff Board commenced taking evidence regarding the question of higher protection for the paper industry, it has come to be a general belief that the present Indian system of manufacturing paper is radically wrong. In forwarding this view from Bombay a correspondent of *The Times* (Trade Supplement) adds: So long as paper and pulp are habitually made in the same mill, neither industry can be fully developed. There are few locations, if any, in India entirely suitable for the manufacture of both paper and pulp on a commercial basis. It seems, therefore, advisable to adopt the practice prevailing in Europe and America, of running the two industries separately; one large pulp mill could then supply several paper mills. The main difficulty lies in the fact that at present there is no market for pulp made in India.

Print in the Argentine.

The visit of the Prince of Wales to the Argentine Republic next year is arousing a great deal of interest, not only in this country, but in South America. These peregrinations of His Royal Highness are not without their value to British industry and commerce, and closer and improved relations between this country and the Argentine are likely to result from the Prince's tour. In the meantime, the business outlook in the Argentine shows considerable improvement from many points of view. Apparently there is no unemployment in the country, whilst capital is said to be free from income tax. Moreover, the more favourable course of exchange is expected to result in greater activity in the import trade during this year. Many of the goods which are consumed in the country are such as the United Kingdom can supply, but whether that demand will be transformed into larger orders for British goods or whether it will be neutralised by intensified competition from Germany is not yet clear. At all events, there is an old standing connection between the printing and allied trades of this country and Argentine consumers, which it is hoped will benefit from the improved conditions and from the Prince's visit.

Argentine Market for Stationery.

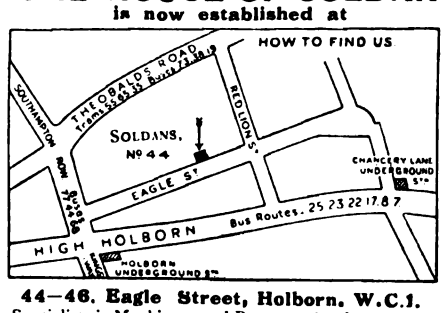
The Argentine is a very important market for paper, cardboard and stationery of all kinds, as the local industry, although important, is limited chiefly to wrapping paper and inferior printing paper and quantity production of the cheaper varieties of stationery. Of news-print some 60,000 tons are imported annually principally from Germany and Scandinavian countries, and 17,000 tons of book paper. In the better quality writing, printing and book paper, English makes which have been known for years always have a sale, but in the cheaper lines which form the greater part of the trade severe competition is encountered from German and Austrian manufacturers. Germany supplies the greater portion of imported wrapping paper which amounted to 3,667 tons in 1923. Germany also supplied the greater part of imported stationery and stationers' supplies. Germany was followed by the United States.

Postage Weight Limit.

Efforts are being made by British commercial men in the Argentine to secure an alteration in the British postal weight limit for parcels sent from this country abroad or to the colonies. This weight is at present fixed at 11 lbs. (5 kilos.), whereas the limit for the Argentine, France, Germany, Australia, the United States and various other countries is 22 lbs. (10 kilos.). Naturally this is a distinct advantage to the foreign competitors of British business men in the Argentine and other countries, and representations have been made to the British Postmaster-General to bring the weight imposed by the British postal authorities to the same level as exists elsewhere. The responses of the British postal authorities have been very cordial, and there is every prospect of the demand being acceded to, in which case the Argentine Republic will be among the first of the foreign countries with which the new service will be established.

China's Board Imports.

The chief market is for strawboard, a field in which, however, importers must meet severe competition from the native mills—says a U.S. Commerce Report upon the position of China in regard to paper products. The Japanese are the chief suppliers of the imported board, but have been meeting increased competition from the United States during the past few years, the latter country furnishing 30 per cent. of the imports into Shanghai during 1923, compared with less than 5 per cent. in 1921. Chip board, which is supplied principally by American mills, is being used for the same purposes as strawboard when it can be obtained at a competitive price. Among the better classes of board the chief demand is for a white, patent-coated "news" board, which is used in the manufacture of cigarette boxes and similar products. There is also a fairly large market for white bristol board in sheets measuring 22½ in. by 28 in., and a very small market for coloured index bristol, which is in demand chiefly by the foreign business houses. The United States furnishes the greater part of these classes, imports from that source into Shanghai in 1923, reaching $305,707, while its nearest competitors, Japan and Great Britain, furnished only $135,519 and $32,573 worth respectively.



South Africa's Paper Industry.

Position of British Products.

Futile and costly to the consumer as so much of South Africa's artificial industry-bolstering has proved, there are a few directions in which it has been effective, and one of these is in connection with the Union's papermaking activities, says the *British South African Export Gazette*. For example, one well-known English firm who specialise in wrapping paper—it is, of course, this class of manufacture only which is affected—tell me that of recent years their South African business has been almost entirely without profit in view of local competition and the adverse tariff, and they are withdrawing from the market.

"This is exactly the result I foresaw two years ago," adds the writer, "when the Premier Paper Mills, Ltd., at Klip River, proved their ability to produce from imported pulp a first-grade kraft or wrapping paper, and, at the same time, the Union Government imposed a protective duty of ¾d. per lb., followed by a dumping duty last September against Canada and Sweden. True, the dumping duty only diverted the trade to Germany and other countries, and it was therefore promptly revoked, but the Premier Mills have progressed in spite of certain vicissitudes, and are now engaged in installing still larger plant for dealing with baobab. They have made good their position in the market, and this, coupled with Canadian and Continental competition in wrapping paper, has undoubtedly made the trade almost impossible to English manufactnrers. It is interesting to note, however, that the imports from other sources are still holding their own, for they totalled £156,759 in the first ten months of 1924, against £152,370 in the previous year."

Paper Trade Statistics.

Overseas Countries' Imports and Exports of Paper.

The quarterly return dealing with the figures up to December 15th, 1924, issued by the Board of Trade, gives the following interesting statistics relating to the imports and exports of paper of certain foreign countries and British Possessions:—

LITHUANIA.—Paper and paper manufactures imported into Lithuania during the nine months ended September represented 2,981 tonnes (of the value of 3,380,000 litai), compared with 3,647 tonnes (4,375,000 litai) in the preceding year. Exports of a similar class of merchandise in the same nine months of 1923 amounted to 1,634 tonnes (1,226,000 litai). [Litai = 46·25 to the £ in 1923 and 44·05 in 1924].

FINLAND.—In the ten months ended October news-print was exported from Finland to the extent of 103,697 tonnes (of the value of 311,228,000 marks), compared with 104,992 tonnes (313,369,000 marks) in the corresponding period of the preceding year and 108,170 tonnes (398,191,000 marks) in 1922. Packing paper exports in the three respective periods were: 22,991 tonnes (72,312,000 marks), 20,348 tonnes (73,264,000 marks), 25,329 tonnes (106,509,000 marks). Pasteboard: 25,261 tonnes (50,835,000 marks), 20,384 tonnes (47,703,000 marks), 18,898 tonnes (54,566,000 marks). Writing paper: 2,916 tonnes (13,974,000 marks), 5,476 tonnes (27,087,000 marks), 10,119 tonnes (60,548,000 marks). Tissue paper: 997 tonnes (14,155,000 marks), 889 tonnes (10,344,000 marks), 317 tonnes (7,263,000 marks).

NORWAY. — Printing paper exported amounted to 103,830 tonnes in the ten months ended October last, as contrasted with 117,804 tonnes in the corresponding period of the preceding year, and 117,528 tonnes in the 1922 ten months. Packing paper dispatched from Norway during January to October last stood at 47,445 tonnes, compared with 54,833 tonnes in the corresponding ten months of 1923, and 54,837 tonnes in the similar period of 1922.

SWEDEN.—Paper "of all kinds" exported from Sweden during the ten months ended October reached 276,101 tonnes, against 241,789 tonnes in the corresponding period of the preceding year, and 204,283 tonnes during January to October, 1922.

DENMARK.—The value of paper and paper manufactures imported into Denmark in the ten months ended October last stood at 22,566,000 kr., as against 23,195,000 kr. in the ten months of 1923, and 21,297,000 kr. during January to October, 1922.

GERMANY. — Given in 100 kilos., fancy, coloured, varnished, etc., paper exported from Germany during January to October amounted to 168,535,000, compared with 182,727,000 in the ten months of the preceding year and 142,306,000 in the 1922 period. Photographic paper exports stood at 9,325 during January to October last, contrasted with 9,362 in the similar period of 1923, and 11,628 in the ten months of 1922. Exports of fancy, coloured, varnished, etc., paper in the ten months ended October reached a value of 15,436,000 gold marks, whilst the exports of photographic paper in the same period were of the value of 4,438,000 gold marks.

NETHERLANDS.—Printing and writing paper (including news-print) exported from the Netherlands during the ten months ended October represented 40,165 tonnes (of the value of 9,372,000 guldens), compared with 37,383 tonnes (9,322,000 guldens) in the corresponding ten months of 1923, and 29,339,000 tonnes (7,842,000 guldens) in the ten months of 1922. Imports of the same class of merchandise in the same periods were as follows: 32,778 tonnes (7,361,000 guldens), 1924; 29,503 tonnes (7,078,000 guldens), 1923; and 29,535 tonnes (7,010,000 guldens), 1922. Strawboard exports reached 172,069 tonnes (15,998,000 guldens) during January to October, as against 148,327 tonnes (15,098,000 guldens) in the ten months of the preceding year, and 138,294 tonnes (12,085,000 guldens) in the corresponding period of 1922.

BELGIUM.—Paper and cardboard imported into Belgium during January to September reached 17,130 tonnes (73,537,000 francs), against 17,799 tonnes (61,480,000 francs) in the corresponding period of the previous year. Exports for the same periods covering a similar variety of manufacture stood at 26,750 tonnes (83,002,000 francs) last year and 26,695 tonnes (67,969,000 francs) in 1923.

FRANCE.—Given in 100 kilos., paper imported into France in the ten months ended October amounted to 1,211,714 (192,245,000 francs), contrasted with 1,083,412 (152,409,000 francs) in the ten months of the preceding year, and 1,066,862 (132,827,000 francs) in the 1922 period. Exports of paper in the same three ten-monthly periods were: 444,708 (224,316,000 francs), 1924; 399,241 (200,867,000 francs), 1923; 288,652 (142,309,000 francs), 1922.

SWITZERLAND.—Exports of printing paper, etc., during the first nine months of the year, in 100 kilos., reached 76,837 (4,144,000 francs), as against 86,665,000 (4,793,000 francs) in the preceding year, and 94,398 (5,485,000 francs) in the corresponding nine months of 1922.

SPAIN.—Paper for cigarettes exported from Spain during January to December of 1923 amounted to 2,889 tonnes (of the value of 10,460,000 pesetas), as contrasted with 2,296 tonnes (8,313,000 pesetas) in the similar period of the preceding year and 3,248 tonnes (11,758,000 pesetas) in the 1921 period.

ITALY.—In 100 kilos. paper (white or dyed in the pulp) exported from Italy during the nine months ended September represented 108,592 (of the value of 45,713,000 lire), compared with 42,778 (26,843,000 lire) in the nine months of the preceding year, and 21,599 (24,751,000 lire) during January to September, 1922.

HUNGARY.—Paper (in 100 kilos) imported into Hungary during the nine months ended September last reached 219,166, against 217,834 in the nine months of the preceding year, and 275,639 in 1922. Cardboard imported during January-September stood at 44,438, compared with 43,337 in 1922, and 52,434 in the nine months of 1922. Exports of paper and paper manufactures (in 100 kilos) exported during January to September last amounted to 2,442, compared with 4,184 in the 1923 period, and 6,642 in the same nine months of 1922.

CZECHO-SLOVAKIA. - The exports of printing paper, in 100 kilos., shipped from Czecho-Slovakia during the nine months ended September represented 7,299, contrasted with 8,296 in the corresponding period of the preceding year. The following represent the other classes of paper goods leaving Czecho-Slovakia during the first nine months of the year, the figures in parenthesis showing the amounts in the corresponding period of the previous year: Cardboard, 6,756 (4,417); packing paper, 6,800 (8,370); writing paper, 877 (1,625); cigarette paper, 370 (369).

GREECE. — Printing paper imported into Greece during the twelve months of 1923 amounted to 3,928 tonnes (25,238,000 drachmas), contrasted with 5,430 tonnes (16,125,000 drachmas) in the corresponding period of the preceding year, and 4,663 tonnes (9,766,000 drachmas) in the 1921 period. Writing paper imported during January to December last year reached 654 tonnes (5,356,000 drachmas), 701 tonnes (3,372,000 drachmas) in the corresponding twelve months of 1922, and 968 tonnes (3,256,000 drachmas) in the 1922 period. Printing paper imported in the first four months of last year amounted to 1,682 tonnes (9,507,203 drachmas), against 1,314 tonnes (11,316,000 drachmas) in the corresponding period of the preceding year, and 1,638 tonnes (3,895,000 drachmas) during January to April of 1922.

EGYPT.—Imports of paper and other classes of paper goods imported into Egypt (in kilos.) during the nine months ended September last were as follows, the figures in parenthesis representing the amounts for the corresponding nine months of the preceding year: Wrapping paper, 8,213,710 (9,829,288); cardboard, 5,312,659 (5,259,272); printings, 4,811,056 (4,818,695); writings and envelopes, 1,265,919 (1,146,097); cigarette paper, 448,899 (422,051). The nine months' value of wrapping paper imports last year reached £E129,000, as against £E134,000 in the nine months of 1923. Cardboard stood at £E71,000, compared with £E74,000; printings, £E99,000, against £E111,000; writings and envelopes, £E15,000, against £E49,000; and cigarette paper, £E53,000, against £E48,000. Exports of cigarette paper in the three nine-monthly periods were: 29 tonnes (£E9,000), 1924; 29 tonnes (£E8,000), 1923; 33 tonnes (£E14,000), 1922.

BRAZIL. — Paper and paper manufactures entering Brazil during the twelve months ended December reached 48,367 tonnes (75,860,000 milreis), compared with 43,923 tonnes (51,704,000 milreis) in the corresponding period of 1922, and 29,267 tonnes (59,178,000 milreis) in the twelve months of 1921.

CHILE.—Printing paper imported into Chile during the nine months ended September amounted to 11,260 tonnes (of the value of 2,588,000 pesos fuertes), against 10,790 tonnes (2,661,000 pesos fuertes) in 1923 (nine months) and 6,818 tonnes (1,805,000 pesos fuertes) in the 1922 period.

JAPAN.—Paper and cardboard imported into Japan during the nine months ended September were of the value of 19,108,000 yen, against 11,050,000 yen in the corresponding period of 1923, and 15,012,000 yen in the 1922 nine months. Exports of paper from that country during the same periods were: 11,756,000 yen (1924); 10,893,000 yen (1923); and 11,673,000 yen (1922).

SIAM. — Unprinted paper imported into Siam during the nine months ended September amounted to 1,799 tonnes (of the value of 694,000 ticals), against 1,816 tonnes (667,000 ticals) in the nine months of 1923, and 1,680 tonnes (699,000 ticals) during January to September, 1922. [Tical in 1922 = 9.50 to the £, in 1923 10·99, and in 1924 11.00.]

BRITISH INDIA.—During the six months ended September paper and pasteboard imported into British India by sea represented 763,765 cwts. (1,49,14,000 rupees), against 647,862 cwts. (1,38,10,000 rupees) in the corresponding period of the preceding year, and 516,957 cwts. (1,27,98,000 rupees) in the 1922 period.

CEYLON.—Printing and writing paper imported into Ceylon during the eight months ended August amounted to 26,268 cwts. (7,11,000 rupees), compared with 26,217 cwts. (7,56,000 rupees) in the corresponding period of the preceding year, and 16,748 cwts. (6,60,000 rupees) during January to August, 1922. "Other paper" imports were valued at 10,59,000 rupees during January to August last, 9,30,000 rupees in the previous year, and 8,51,000 rupees in the corresponding eight months of 1922.

NEW ZEALAND.—Imports of printing paper represented 284,883 cwts. (£362,000) during the eight months ended August last, 278,609 cwts. (£348,000) in the preceding year, and 196,569 cwts. (£241,000) in the eight months of 1922. "Other paper" imports stood at the value of £350,000 during the eight months ended August last, £395,000 in the corresponding period of 1922, and £209,000 in the eight months of the preceding year.

BRITISH SOUTH AFRICA.—Printing paper imports reached 278,647 cwts. (£319,000) during the eight months ended August last, 272,274 cwts. (£321,000) in the 1922 period, and 194,464 cwts. (£251,000) during the eight months of 1922. Wrapping paper imports in the three respective periods were: 99,141 cwts. (£119,000), 1924; 114,842 cwts. (£124,000), 1923; 73,764 cwts. (£108,000), 1922. "Other paper" imports represented a value of £398,000 in January to August last, £460,000 in the corresponding period of 1922, and £430,000 in the 1922 eight months.

IRISH FREE STATE.—Packing paper imported into the Irish Free State during the first ten months ended October last represented 119,655 cwts. (£152,000). Printing paper imports were 219,655 cwts. (£262,000), and stationery amounted to 24,295 cwts. (£122,000).

Supplies for the Oversea Printer.

Continued Expansion in Colonial Trade with the Mother Country is Indicated in the Returns for the Past Year.

The amount of business transacted by the Mother Country in supplying the oversea markets with paper and cardboard last year was on a comparatively large scale, and the export statistics relating to these branches of manufacture presented quite a healthy tendency. Amounting to 4,757,943 cwts. (of the value of £9,229,547), the paper and cardboard shipments last year compare with 4,341,118 cwts. (£8,762,998) in 1923 and 2,454,177 cwts. (£6,747,765) in the preceding year.

Printing Paper.

Printings exported again constituted the most prominent feature of the returns relating to the shipments of paper and cardboard last year. Amounting to 3,015,035 cwts., the figure represents a proportion of no less than 63.3 per cent. of the total tonnage of British paper and cardboard exports occurring during the year, and in addition indicated substantial increases compared with the preceding years. Shipments of this class of manufacture recorded during the whole of last year and the two preceding ones are shown as follows:—

	cwts.	£
1925	3,015,035	4,059,998
1924	2,810,550	3,969,478
1923	1,498,699	2,586,026

Australia again held the leading position as the largest purchaser of this class of paper during the year, that market absorbing 1,810,340 cwts., of the value of £2,020,762. The fact that the consumption of this class of paper in the Commonwealth last year surpassed by 206,963 cwts. the quantity sent in 1923, and by 1,169,442 cwts. the shipments of the preceding year, shows the beneficent effect of the preference granted to the Mother Country to this branch of British manufacture.

New Zealand occupies the second position with 210,133 cwts. (£263,425), figures which show a decline contrasted with the 220,052 cwts. (£307,161) recorded in the preceding year, but a considerable increase against the 114,507 cwts. (£178,708) registered during 1923.

British India, third on the list, absorbed this class of manufacture to the extent of 178,566 cwts. (£283,387) in 1924, compared with 207,175 cwts. (£345,866) in the preceding year, and 175,830 cwts. (£307,492) in 1922.

British South Africa was also responsible for taking less last year than was the case in 1923, the actual receipts for the respective years being as follows: 96,907 cwts. (£174,054), 1924; 116,698 cwts. (£210,878), 1923; 69,913 cwts. (£146,473), 1922.

Canada increased her purchases during the year, taking 27,916 cwts. (£61,081) last year, 24,226 cwts. (£47,666) in 1923, and 20,473 cwts. (£44,569) in 1922.

The other two British markets enumerated were Ceylon and the Straits Settlements, both of which bought liberal quantities of this material.

Coated Papers.

In spite of increased supplies of coated papers—comprising printed and embossed paper hangings—reaching this country from the principal foreign sources, the export business transacted by home manufacturers of this branch of manufacture appears to be on the up-grade. Not only was there a consistent increase month by month, but by the end of the year consignments reached 129,573 cwts. (£581,216), against 108,100 cwts. (£492,752) in 1923, and 66,822 cwts. (£369,491) in the preceding twelve months.

"All other sorts" of coated papers, except waterproof wrappings and roofing paper, sent abroad during the year represented 56,255 cwts. (£355,230), compared with 50,742 cwts. (£311,388) in the preceding year, and 28,553 cwts. (£240,674) in the 1922 twelve months.

Writing Paper.

The returns relating to writing papers did not show up quite so favourably last year as was the case with many other branches of paper and cardboard shipments, the falling-off being largely accounted for by the reduced requirements of the Australian market. Notwithstanding the decline indicated on the part of the Commonwealth, this important market was by far the largest buyer during the year, her total amounting to 84,487 cwts. (£217,806), contrasted with 106,035 cwts. (£255,085) in the preceding year, and 73,147 cwts. (£202,993) in 1922. The shipments to the other British markets, in the order of importance, were as follows, the figures in parentheses representing the returns for the preceding year: British India, 39,153 cwts., £105,439 (40,858 cwts., £118,386); New Zealand, 34,043 cwts., £75,356 (29,131 cwts., £71,543); British South Africa, 11,605 cwts., £40,063 (12,637 cwts., £41,637); Canada, 3,866 cwts., £12,609 (4,265 cwts., £15,392); Ceylon, 3,309 cwts., £9,669 (2,966 cwts., £9,749); and the Straits Settlements, 1,630 cwts., £7,154 (2,334 cwts., £8,641).

Tissues.

The demand from abroad of tissue paper of British manufacture has been well maintained. During the year under review exports of this variety of paper reached 14,425 cwts. (£131,726), as against 13,659 cwts. (£130,765) in 1923, and 11,295 cwts. (£115,840) in the preceding year.

Packings and Wrappings.

In this category, the British producer and exporter have to meet a considerable amount of severe competition from abroad, from which quarter ever-increasing quantities are coming forward. However, in spite of this competition, shipments of packings and wrappings last year—though not quite so large as one would like to see—amounted to 687,453 cwts. (£578,799), contrasted with 574,309 cwts. (£480,887) in the preceding twelve months, and 313,881 cwts. (£313,889) in the 1922 period.

Stationery Exports.

Under the heading of Stationery envelopes—which does not include boxed stationery goods—sent abroad last year do not show up so well as the preceding year, but were considerably better than in 1922. Last year's shipments amounted to 43,658 cwts. (£188,323), figures which compare with 45,121 cwts. (£191,917) for 1923, and 37,055 cwts. (£182,830) in the preceding year. "Other sorts" of stationery exported during the year, however, were an advance both upon 1923 and 1922. The actual figures for the three respective years were as follows: 183,545 cwts. (£1,345,549), 1924; 167,462 cwts. (£1,332,757), 1923; 128,751 cwts. (£1,485,188), 1922.

Deliveries abroad of stationery (other than paper) last year were of the value of £1,480,744, against £1,419,138 in the twelve months of 1922. Australia is shown as the largest buyer of this class of product, with £185,379, contrasted with £185,584 in 1923. The next market in order of importance was British India, whose supplies amounted to £168,297, against £183,343 in the preceding year. The following represent the shipments to the other enumerated British markets, the figures in parentheses showing the value of their purchases for the year: New Zealand, £59,319 (£68,493); Canada, £55,939 (£46,874); Straits Settlements, £29,839 (£32,653); Ceylon, £21,631 (£21,422). The value of this class of manufacture sent to the United States last year amounted to £138,562, whilst, under the heading of "Other countries," it was £762,046.

Boards.

The statistics relating to the exports of boards (comprising millboards, strawboards, cardboard, etc.) indicate a considerable expansion in trade last year compared with the two preceding years. This improvement is all the more satisfactory in view of the increased consignments that are coming to this country month by month from foreign sources. Shipments from this country last year amounted to 156,485 cwts. (£256,449), figures which compare with 122,239 cwts. (£231,621) for the preceding year, and 85,073 cwts. (£188,358) in 1922.

Printed Books.

Printed books always constitute an important section of the export side of business connected with the printing and allied trades, and from the statistics it would appear that printed books of British production are meeting with an increasing demand from overseas. During the year just completed, exports of printed books, etc., amounted to 475,180 cwts. (£4,200,575), contrasted with 386,405 cwts. (£3,631,555) in 1922, and 274,496 cwts. (£3,168,391) in the preceding year.

Printing Type.

Exports of printing type from this country last year did not quite reach the level of the preceding year, but showed a slight improvement compared with 1922. The actual export figures for the three respective years were: 196 tons (£69,031), 1924; 198 tons (£69,512), 1923; 189 tons (£59,501), 1922.

Boxes and Cartons.

Shipments under this heading last year represented a satisfactory improvement compared with the preceding year's returns, and were very much better than those of 1922. The increased statistics indicate strongly the greater use being made of this important article of everyday use, and the satisfactory manner in which British manufacturers are responding to the demands being made upon their enterprise. Boxes and cartons sent overseas last year amounted to 58,116 cwts. (£216,521), compared with 41,546 cwts. (£175,184), and 19,569 cwts. (£103,298).

Paper Bags.

Statistics relating to the exports of paper bags show that last year's returns amounted to 59,082 cwts. (£117,126), as compared with 47,000 cwts. (£104,266) in the preceding year, and 17,255 cwts. (£61,627) in 1922.

Playing Cards.

Exports of playing cards last year presented a better showing than was the case in the two preceding ones, the actual figures being as follows: 3,131 cwts. (£62,153), 1924; 2,470 cwts. (£47,498), 1923; 2,203 cwts. (£43,291), 1922.

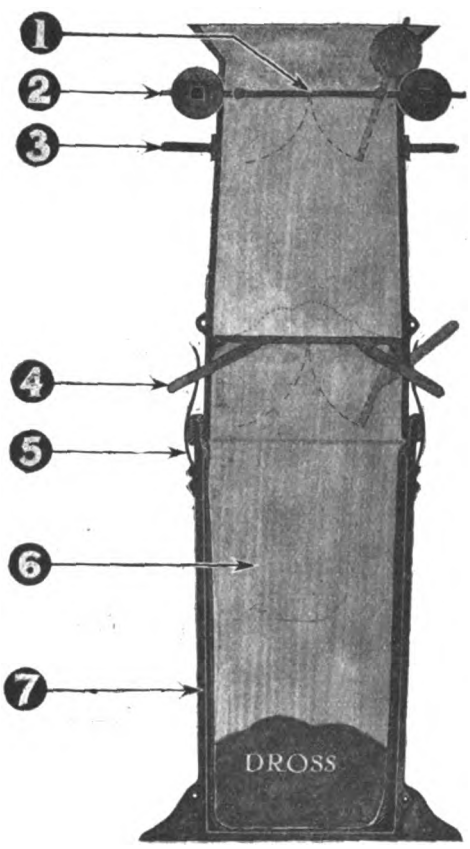
What our Manufacturers are Doing

Printing Machinery and Other Products that Merit the Attention of Overseas Buyers.

Lithographic Machinery: George Mann and Co., Ltd.



This old established firm of lithographic machinery makers report that their business is booming; so much so, in fact, that they have had to extend their huge factory at Hunslet, Leeds, to enable them to cope with the orders received. No details are yet to hand, but we hear on the best authority that this enterprising firm is going to cause a sensation at the Printing Exhibition next May. The surprise is in connection with a patented invention for their two colour and perfecting rotary offset machines. Anyway, printers going to the Exhibition will doubtless wish to visit Stands 5 and 6, Row F, in the Main Hall, where they will see for themselves what it is. As is generally known, Mann's two-colour machine has only three cylinders, and bears other special patented features which place it in a class of its own. It is claimed to be the only machine which will print at will: (1) two colours on the front of the sheet; (2) same colour front and back (*i.e.*, perfecting); (3) different colour front and back (*i.e.*, perfecting); (4) single colour front or back. To use the machine as a perfector requires but three simple adjustments as follows, viz., the removal of a spring stud, the change of position to spring lever, and the retarding the timing of a single gear—all so easy that a boy could effect them.

Plant and Machinery: Connoll and Coles, Limited.

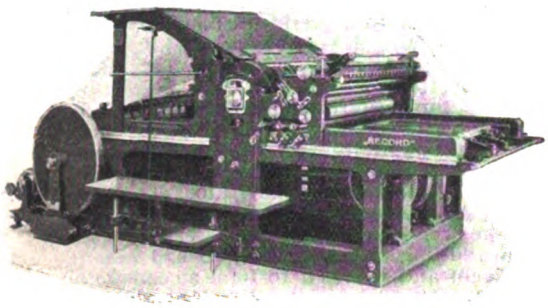
Messrs. Connoll and Coles, Ltd. (incorporating W. J. Connoll and Co.), practical printers' engineers and furnishers of Leatherlane, Holborn, E.C.1 (and at Clerkenwell), offer a large selection of new, secondhand and rebuilt plant and machinery for the allied trades, both for sale and wanted, in the latest issue of their "Printers' Exchange" register, including wharfedales, platens, guillotines, litho, perforating, stitching, bending, paging, folding, composing and other machines. The firm are offering also a special reel-fed platen and both rotary and reel-feed combination counter check book machines, which they started making in 1900, and we noticed a remarkable testimonial relating to this type of machinery. An interesting point is that "terms can be arranged and old machines are taken in part payment." Messrs. Connoll and Coles, Ltd., have always specialised in rebuilt machinery, and on the occasion of a recent visit, we saw some of the results. The way worn machines are made "like new" is worthy of note when the cost of a rebuilt against a new machine is considered. In addition to treating machines which they buy and sell, they rebuild printers' own machines, and a few pounds' outlay often increases the value of a machine to a remarkable extent when the next valuation is made. We also noticed a practical little tool that is priced at 50s. only and which should interest the trade, viz., a small power ball-bearing bench saw, with a tilting table 8 in. by 9½ in. for rapidly cutting stereos, zincos, wood, brass, copper, ebonite, lead, etc., etc. Apart from other activities, they are turning their experience of over two years' work in connection with vertical cylinder presses to advantage by the production of the all-British "Vercyl" high-speed job press. The machine is made to take a full size crown folio sheet and is fitted with exceptionally fine cylindrical inking, and with automatic delivery print side-up in front. The "make-ready," register, impression, capacity, speed, production, etc., are all excellent, and the press satisfactorily deals with all classes of paper stock. Springs are entirely deleted and apositive cylinder check action is fitted, bed movement is perfect and the price is revolutionary. Advance orders have been placed by printers who have co operated in the design and who have suggested some of the numerous improvements on an imported machine recently sold by Connoll's. The "Vercyl" will be a feature of the Connoll and Coles stand at the Printing Trades' Exhibition in May next, when it will undoubtedly confirm the good impression already created, as it is of very handsome and pleasing appearance besides being of tremendous practical utility for high-speed and high-grade work. The firm are well placed to execute export orders and have indents in hand from India and China at the present time. Repairs, removals and breakdowns are promptly and efficiently dealt with by practical mechanics and at reasonable charges.

New Dross Container: Fry's Metal Foundry.

The report on "Lead Poisoning among Printers" by Dr. T. R. Legge, Senior Medical Inspector of Factories, says: "All reported cases can definitely be said to be due to the inhalation or breathing in of either dust or fumes containing lead. Handling of type metal and fresh type is harmless. The stereotyper and foundry worker gets lead poisoning

from drossing the molten metal, careless dumping of the dross on the floor, and the subsequent sweeping up and bagging operations." Messrs. Fry's Metal Foundry set out to overcome this danger, and the container they devised has already been successfully adopted by many printing works in England. Fry's Dross Container consists of an upper chamber into which the dross is fed through balanced lids; when it is cool, the dross is released into a sack in the lower chamber. When the sack is full it is removed and stored ready to be sent away. Thus the dross is kept under cover from the time it is skimmed from the pot until it leaves the works. The Containers do away with heaps of dross on the floor, and lead dust blowing through the foundry. The Dross Container may be inspected by South African printers at the showrooms of Messrs. Wm. Dawson and Sons (S.A.), Ltd., 29-31, Long-street, Cape Town, who act as agents for Fry's Metal Foundry for the Union of South Africa. Similarly, they are on view at the offices of Messrs. John Dickinson and Co. (Australasia), Ltd., of Wakefield street, Wellington, and Auckland. The illustration shows a sectional view of the dross container, and reference to the indicator numbers will facilitate an understanding of the apparatus. The features indicated are: 1, self-closing dust-tight lid—the flaps open automatically with the weight of the dross; 2, counter balances for closing lids automatically after dross has fallen through; 3, handles for lifting off top half of container, in order to fit empty sack or remove a full one; 4, movable base plates on which dross rests until cool, when the lifting of the two projecting levers opens the base plates and permits the dross to fall into the sack; 5, spring arms for securing top half of dross container in correct position; 6, sack of usual size for collection of dross—placed with mouth of sack overlapping the top edges of the lower container, and held in position by weight of top half of container; and 7, lower container, which holds the dross sack.

Offset Machinery: J. and S. Eyres, Ltd.



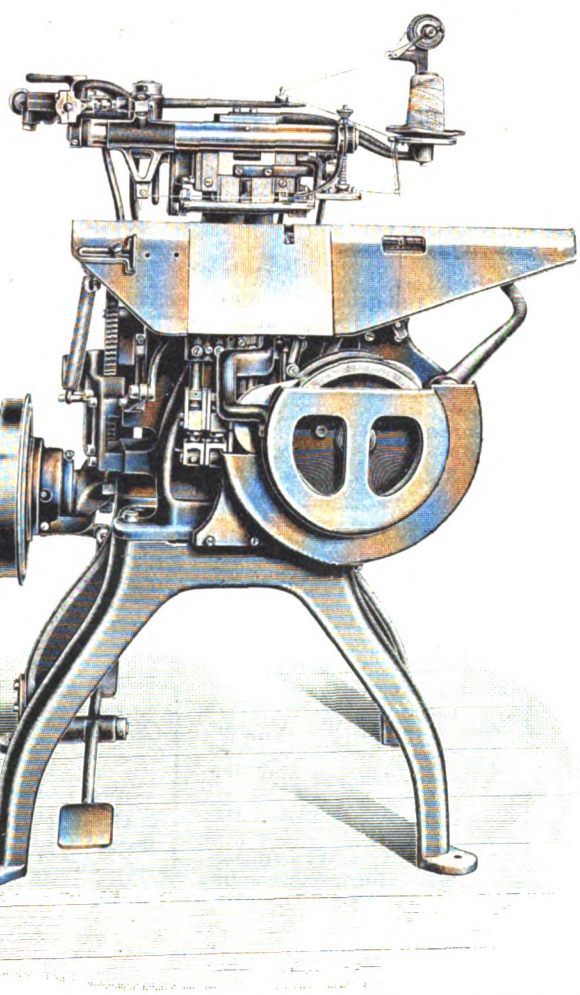
Printers at home and overseas who handle or wish to handle printing by offset methods would do well to bear in mind the name of J. and S. Eyres, Ltd., of Miles Platting, Manchester, who have often shown themselves able to help very materially in the provision of suitable equipment. Their speciality is the conversion of flat-bed direct litho machines into offset machines, the converted machines being adapted for use either for direct litho or for offset as may be desired. Messrs. Eyres tell us that they are prepared to prove that for short runs and as a proofing press the flat-bed machine is far more economical than the rotary. At the head of their business is Mr. James Hall, who has had over thirty years' experience in the printing machinery trade, and the firm's standing is to some extent indicated by the fact that there are at present over 250 machines at work in the British Isles which have been converted by them, as many as ten repeat orders having been received from one house. Of special interest to foreign and colonial readers is the section of their business in which Messrs. Eyres have had considerable experience in providing for the needs of oversea printers. This is the department dealing in the export of rebuilt machines. Messrs Eyres generally have on hand a few really first-class rebuilt machines of various makes, complete with offset equipment, suited for printing on paper or tin. These are well adapted to fill a need felt by many foreign and colonial printers.

Rotary Presses: Soldans, Ltd.

The successors to the well-known firm of Soldan and Co.—Messrs. Soldans, Ltd., of 44-46, Eagle-street, W.C.1—have in their managing director, Mr. O. Soldan, a man who shows sound judgment in the emphasis he places upon quality as the keynote of the product they supply. This is illustrated in respect of the "Vomag" rotaries which they bring to the attention of our readers in the advertising pages of this journal. This enterprising firm have established a high reputation for the quality of their products, and the many modern patents and labour-saving devices embodied on their machines are of immense value in achieving a first-class result. Great strength and durability is imparted to their machines by the specially toughened castings and hardened steel bearings employed. Many of their machines have been running for years not only in this country and in every European country, but also in American and all parts of the world. This high position has been obtained by the Vogtländische Maschinenfabrik A.G. by specialisation in this branch of printing machine manufacture, as they build only rotaries; but of those they build all types. A glance round the showrooms of Messrs. Soldans, Ltd., is very instructive. Amongst the machines shown is the "Record" fast-running, fine art, stop-cylinder machine, which is fitted with flywheel and main driving shaft mounted in ball bearings, cylinder check and pyramid ink distribution controlled throughout by micrometer screws. It is perfectly balanced, and will handle anything from the daily commercial job to fine

Digitized by Google

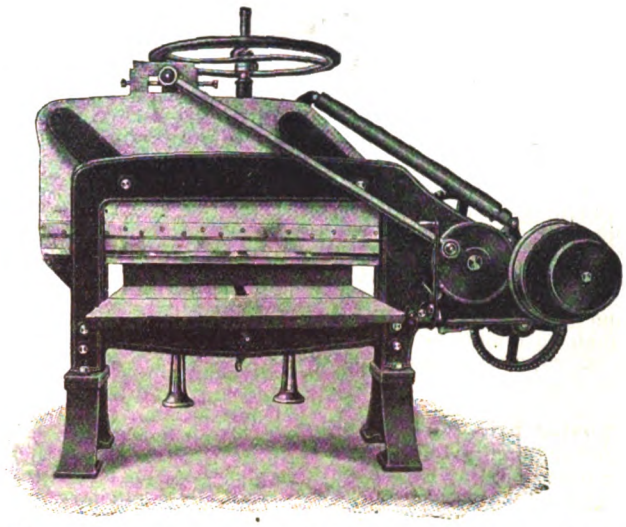
art colour work. The "Brilliant" heavy platen is also a sound machine. It has the modern camless roller carriage drive and every up-to-date feature looked for on a machine fitted to cope with the heaviest solids and the most delicate three or four-colour blocks. The



"Record" Stop-Cylinder Press: Soldans, Ltd.

"Baby" jobbing disc ruling machine is a marvel of engineering and compactness. Not only will it rule a double cap sheet at 3,000 per hour on feints, or strike in two colours at 2,000 per hour, but it will cut, crease and perforate the job at the same time if desired.

Machinery: R. Hurner, Ltd.



Messrs. R. Hurner, Ltd., inform us that they have lately succeeded in extending their field of operations, and every week many satisfied customers are added to their already large number of permanent clients, who appear to appreciate particularly the services received in the way of attention to small matters of detail. Messrs. Hurner supply all the Brehmer specialities, amongst which may be mentioned such machines as the Brehmer wire and thread stitchers, wire and thread book sewing machines, folding machines, boxmaking machines, glueing and gumming machines, pasting machines, etc. A useful machine upon which they are laying emphasis at present is the Brehmer thread and cord stitching and knotting machine, for exercise books, pamphlets, copy books, pads, calendars, etc. This machine, which we are able to illustrate herewith, will stitch such things as pamphlets, exercise books, pads and the like at a speed of up to 2,400 stitches per hour. The length of the stitch and the number of holes can be varied within limits; and if specially ordered up to $\frac{3}{8}$-in. in thickness can be stitched on this machine, which also makes a perfect knot using thread and cord. The production of this knot, which does not untie easily, is a strong feature of the apparatus. The machine can be supplied to produce one, two, three, four or five different sizes of stitches of 2 ins., $2\frac{9}{16}$ ins., 3 ins., 4 ins. or 5 ins. in length. The 2 in. stitch is the only one which has only two holes, all the rest having either two or three holes. Any thickness can be stitched on a standard machine up to $\frac{1}{4}$ in., either on the saddle, which is provided for stitching through the fold, or on the flat table, which is intended for stabbing through the side of the work. On this machine loops for hanging purposes can be produced without any alteration, and an arrangement for looping calendars, show cards, confectionery boxes, etc., with thick cord can be supplied if desired. Messrs. Hurner, Ltd., have an expert staff who are specially trained for the handling of Brehmer machinery.

Brehmer Thread and Cord Stitching and Knotting Machine.

Machinery: W. J. Light and Co., Ltd.

Of the many interesting machines introduced by Messrs. W. J. Light and Co., Ltd., one of the most recent and most notable is the self-clamp guillotine which we illustrate herewith. This patent guillotine, known as model ABS, is of heavy build, designed for power drive with friction clutch. It acts with shear and diagonal motions and effects ten to twelve cuts per minute. After each cut the knife stops automatically in its highest position. A notable feature is the patent spring self clamp which is exceptionally powerful and will hold the stock absolutely firm. The pressure range of the self-clamp is about $1\frac{1}{2}$ in. The pressure of the clamp can be decreased at will, which is very important when cutting printed matter. For very puffy paper the clamp is constructed with a special stroke for the pressbeam. The machine is remarkable for its extremely simple and practical construction. The use of heavy weights is done away with, and it is claimed that production can thus be doubled and trebled, as compared with guillotines working with press-weights. Even with this increased production, there is no shaking of the machine; nor is there any vibration when the press-beam is set on the pile of paper. The construction of the self-clamp obviates any breakage of the machine in consequence of incorrect setting. The cutting indicator, supplied with each machine, allows the operator to see exactly where the cut will come. The unexpended power of the clamp is utilised for raising the knife, and is part of the momentum of the machine. The balance of power resulting thereby enables the machine to be worked by hand for shorter cuts. Rapid and convenient working is possible, ensuring accurate clamping of the pile at all times. The patent combined shear and diagonal cutting motion saves both the machine and the knife, economises power, and ensures a better and easier cut. This combined shear and diagonal cut requires no adjustment, even after grinding the knife, as it is self adjusting. The machine is fitted with an improved friction clutch with loose flywheel and can be driven either from counter shaft or direct from electric motor. It allows of a most rapid and easy starting or stopping of the machine with the knife in any position.

Self-Clamp Guillotine, Model ABS: W. J. Light & Co., Ltd.

Process Supplies: A. W. Penrose and Co., Ltd.

This firm can now look back over a period of 33 years, and can claim to be the oldest process supply house in the world. During this period they have maintained their reputation for producing the highest class apparatus for the process engraver, lithographer, and kindred trades. A very marked improvement in camera construction is shown in their latest model, the "Empire" camera, which has a steel tubular base, rack and pinion movement, and is brought up to date in other minor details. This apparatus, with the all iron stand made of cold drawn rod and heavy casting, represents a perfect combination. As regards machinery, this firm now make ball-bearing routers, bevellers, saw benches, guillotines, etching machines, and, in fact, everything for equipping a first class shop. Great progress has been made in the polishing of copper and zinc, which formerly was in the hands of Continental and American manufacturers. Such strides have been made in

Digitized by Google

this direction that it has been found necessary to start a fully equipped factory in the North of London. It is claimed that this is the finest equipped works of its kind in England, and it is under the supervision of an expert and fully experienced staff. Then again, for the lithographic trade this firm has very much enlarged their graining shops, and the finest quality grained plates are being supplied, to the complete satisfaction of the most critical users in this country and abroad. A very important department of this complete organisation is the supply of specialised quality chemicals for all reproduction processes. The same care and technical insight are taken in the selection and packing to-day as was first inculcated by Mr. Penrose and Mr. Gamble, the founders. The firm has the advantage of qualified men and fully equipped laboratories for the making of proprietary solutions under brand names for process work and lithography. With their wide experience, and happy in the fact that they have many employees whose length of service covers a great number of years, Messrs. Penrose can assure their customers of getting a standard service of experts in all departments.

Printing Inks: Coates Bros. and Co., Ltd.

This well-known London firm of ink manufacturers report that perhaps one of the outstanding improvements they have been able to make recently is in a newspaper ink they are now manufacturing. This is a tone ink, giving on the half-tone blocks a soft double-tone blue-black which is very pleasing. Messrs. Coates tell us that the particular point about this new quality is that it is so much more economical than anything they have been able to produce previously, and they claim that it is no longer necessary for the large newspapers to use two inks, one a tone ink for half-tones and another where no process blocks are appearing. This new quality, being so very economical, is, we understand, cheaper in actual use than any other newspaper ink that Messrs. Coates have been able to manufacture.

Ink Reducer: Slater and Palmer.

We understand that this well-known London firm of printing ink manufacturers are meeting with much success in respect of their ink reducer "Palmink." This preparation is intended to help the printer who finds that his ink is not distributing properly, or the paper is "picking." A few drops of "Palmink" on the slab and rollers make stiff inks work clean and free and, whatever the paper, will help towards smooth, easy printing. Very neat and handy for those wishing to try "Palmink" is the complete bottle as sent out at 2s. 6d. each. The bottle is carefully packed in a box with sawdust, and is provided with a sprinkler. That is the form in which this article is sent out in small quantities, and hundreds of thousands of bottles have been sold since it was first patented. Messrs. Slater and Palmer supply the same form of package in quart size glass bottles (with sprinkler). The small bottle is 2s. 6d., the quart size 7s., it being of considerable economy to take the larger size. We learn that many printers in the country have in the course of time gone in for small bottles so as to have one available for each machine, and then have purchased from time to time one gallon quantities at 26s. per gallon; the stock is kept in the store room, in charge of some responsible individual, and as the small bottles require replenishing from time to time, that is done by the storekeeper or principal. Thus a further economy is effected, and there is no loss of time by the individual machinist having to go to the storekeeper on every occasion.

"THE "South and East African Year Book and Guide" for 1925, which is issued by the Union-Castle Mail Steamship Co., Ltd., contains much information suitable for the business man, the immigrant, or any with commercial connections with the great African continent. Within its nearly 1,000 pages the volume contains, amongst other useful matter, a gazetteer, statistics relating to imports and exports, and means of transport and communication. Advantage has been taken of the opportunities afforded by the British Empire Exhibition at Wembley to make any necessary amendments and innovations in the text. The immigrant or settler is given practical information on such subjects as immigration, acquisition of land, land laws and data concerning the more important industries of the continent. A useful atlas is included in the volume, the price of which is 5s. 6d. post free

New British Patents.

For the benefit of our readers we have arranged for any inquiries relating to Patents, Designs and Trade Marks to be answered, free of all charge, by a Fellow of the Chartered Institute of Patent Agents. Inquiries should be addressed, in the first instance, to the Editor.

THE *Swedish Timber Trades and Wood Pulp Journal*, which was established in 1885, has just celebrated its 40th anniversary with a special issue, which contains comprehensive international reviews of the industries covered.

Caxton Convalescent Home.

The annual meeting of the Board of Management of this very useful printing and allied trades institution was held at St. Bride's Institute, E.C., on Saturday last. Mr. C. J. Drummond, J.P., presided, supported by the treasurer, Mr. C. W. Bowerman, M.P., Messrs. W. F. France, J.P., C. E. Mason, J.P., and E. Briscoe, trustee.

The thirty-fourth annual report, presented by the chairman, was of a very satisfactory character, both from a financial point of view and as regards the number of patients admitted. Income reached £4,100, an increase of £486 on the previous year, due mainly to a large accession of penny-per-week subscribers. In addition, a legacy of £900 had been received, and invested to form an endowment fund. The debt on the War Memorial Wing has been reduced by £800, and since the close of the year the balance (£200) has been cleared off. The committee are making an effort to raise a fund to complete the building by adding the west wing in accordance with the original plans. For this purpose £560 has been already subscribed, and further donations will be welcomed.

The adoption of the report was seconded by Mr. C. W. Bowerman, M.P., and, after comments of a gratifying character from several members, was agreed to.

Mr. C. J. Drummond, J.P., was again elected president, Mr. C. W. Bowerman, M.P., treasurer, and Mr. S. J. White, secretary. Vacancies on the committee were filled by the appointment of Messrs. W. H. Greatwood (Art Reproduction Co.), A. Low (Hudson and Kearns), W. Tigg (Printing Department, Bank), and E. Tomkins (Wyman and Sons).

An interesting discussion on the convalescent work of the home, the need for the further extension of the building, the growing popularity of the institution with provincial printers, and the best way to make its advantages better known in the printing trades, took place.

Closing the meeting, in reply to a vote of thanks for presiding, the chairman expressed the hope that he would be spared many years to preside over the work of the Home.

Paper Mills Fire Brigade.

The Hemel Hempstead and John Dickinson Apsley Mills Fire Brigade held their fourth annual ball at the Guildhouse, Apsley Mills, recently. There was the usual display of fancy dress and the hall was tastefully decorated. The judges had a difficult task in making their decisions, which were as follows:—Ladies: 1st, Miss M. Hedger; 2nd, Miss D. Thompson. Gents: 1st, Mr. F. W. Lawrence; 2nd, Mr. Monzani. Home-made costumes: Ladies, 1st, Mrs. Martin; gents, 1st, Mr. S. W. Hancock. Mrs. F. G. Hawdon presented the prizes for fancy dress during the interval. The M.C.'s were 3rd officer H. B. Hobday and fireman J. Roberts.

Photogravure from the Printer's Standpoint:

METHODS AND MACHINES

By R. B. FISHENDEN, M.Sc. (Tech)

Intaglio printing is a process by means of which the impression on the paper or other material is produced from incised or engraved cavities filled with ink. In letterpress work the impression is derived from a raised surface, whilst in lithography both the printing and non-appearing portions are on the same level. Of the three processes mentioned, intaglio is, without question, the most interesting.

The artist-etcher using the intaglio method can produce results of incomparable beauty, whilst the same principle in commercial printing, and in combination with photography, provides the means to produce results of exquisite quality at speeds, even on cheap newsprint, exceeding those of the newspaper rotary. In addition, the process is equally applicable to the most advanced developments in colour printing.

Copperplate etching, aquatint and mezzotint, are all intaglio methods, and are usually described as the processes of the artist-etchers. Think for a moment of a vigorous etching by Brangwyn—the lighter tones are represented by strong lines, but these lines are not equal to the strength of those defining the shadow portions. An etching by Whistler, on the other hand, will be found to have the most delicate hair-lines in the lighter tones; or, again, a mezzotint by Cousins or Turner will show smooth tones possessing an infinite variety of gradation. In visualising the beauty of a mezzotint, from the rich velvety shadows to the minute, crisp high-lights, it is well to remember that these effects can be produced only by intaglio processes, just as the varying strength of line in the etching can be obtained in no other way.

Distinguishing Features of Photogravure.

In order fully to appreciate the characteristic quality of intaglio printing it is necessary to understand the essential differences between that process and letterpress, litho and litho-offset work. In both letterpress and lithographic methods every part that prints appears in equal strength, and the printing portions must consist of finite areas, lines or dots. In the reproduction of a photograph the component units of the half-tone block must all be equally black, the various intensities of tone being interpreted by the size of the dots representing those tones. In other words, to produce a variation in tone, black units of equal strength are provided, the variations being produced by changes in the proportion of ink-bearing surface to white paper. In intaglio, the printing cavities may be deep enough to carry a full strength of colour, or so shallow that they yield a proof showing merely a delicate tint. It has been sometimes said that in the case of copperplate etching all the lines are equally black; it will be seen, however, that considerable variations exist. The characteristic intaglio quality is due to the difference in the depth of the cavities.

Speaking of photographic methods, it is interesting to compare mezzotint and photogravure, which are distinctly analogous. In mezzotint there are minute cavities with an irregular grain; in engraving the plate this grain is scraped away to varying depths, thereby making the lighter tones. A photogravure plate has minute grains all over it, the intervening cavities varying in depth, thereby producing different depths of tone. In rotary gravure a ruled screen is used to form the grain.

Rotary intaglio printing is really a quite old process, and has been used by calico printers since 1785. For many years it has been utilised by wallpaper printers at speeds of 120 yards per minute for five colours in perfect register, and the runs extend to millions.

The above is the substance of lecture delivered before the London Central District Master Printers' Association on March 4th, as briefly reported in last week's issue.

On the subject of photo-mechanical intaglio work there are two processes to consider. The first of these is intaglio half-tone or inverse half-tone, which is similar to a half-tone block, but, instead of a raised surface, sunk dots form the printing plate. The depth of these dots is practically equal for every tone, and therefore they are of the same printing strength. A proof from an intaglio half-tone plate is similar to one from a half-tone block or a photo-lithograph, excepting that the softening effect of the intaglio impression will make the dots less distinct. Intaglio half-tone has several technical applications, the most interesting of these being its application to newspaper illustration in Germany in 1910.

Half-tone intaglio and photogravure etching differ widely in their essential principles. The former process is similar to half-tone relief etching, except that the printing parts are etched instead of those which do not print; such a method may be described as utilising a "perfect" or complete resist, in so far that the material which protects the metal from the action of the etching fluid does not, within the limits of the etching period, admit of any penetration. In photogravure etching, on the other hand, the "perfect" resist is substituted by a material that is only a partial resist; this substance is actually penetrated by the etching fluid at various stages of the etching, the shadows first and so on through the lighter tones until the high-lights are attacked; in this way an etched plate is produced possessing qualities similar in some respects to those of a mezzotint engraving.

Rotary Photogravure.

The rotary photogravure process is the direct descendant of the first process of photographic engraving of Henry Fox Talbot, the original account of which was published in 1852. He coated a copper plate with gelatine and a bichromate and exposed this to light under a photographic positive, the grain being produced by means of a gauze. The plate after exposure was etched, the result being an intaglio plate with cavities of varying depths to represent the tones of the subject. Niepce de St. Victor suggested the use of a resin grain in 1855, and later, in 1879, Carl Klic substituted the pigment process of J. W. Swan (now known as the carbon process), for the method employed by Fox Talbot, the dust grain being applied to the copper plate before the gelatine resist print; thus the method became known as the Talbot-Klic photogravure process. Klic, continuing his experiments in England, perfected a method of applying the process to cylinders, and interested Messrs. Storey Bros., of Lancaster, in the work. As a result, the Rembrandt Intaglio Printing Company, Ltd., was formed at Lancaster in 1895.

For a number of years the work produced by the Rembrandt Intaglio Printing Company was the cause of much conjecture among technical men, who endeavoured to ascertain the manner in which the prints were produced. The company realised that it was not possible effectually to protect their process by a patent, because the publication of the specification would have disclosed the essential points; they preferred to work it as a secret process, and in this way managed to preserve the secret for a number of years. Many suggestions were made and articles were published giving scraps of information. Technical progress continued until a number of firms became engaged in the work, and the author published in 1915 a collected account of a series of investigations into the process. It must, however, be universally admitted that the Rembrandt process still retains the first place for the exquisite quality that has been constantly maintained.

Producing Photogravure Cylinders.

The first stage in the production of a rotary photogravure cylinder is the photographic negative, and from this a laterally reversed transparency, or positive on glass, or film, is prepared. The positive is retouched with great care, an operation which replaces that of fine etching in half-tone block-making. The character of the finished result depends in a large measure upon the quality of the transparency and the skilful retouching. In the case of periodical work, the transparencies of various subjects are made up and placed in their pre-determined position on large glass plates. In work of this kind great care must be taken that all the transparencies match, otherwise their etching value will differ. The transparencies are then printed on a prepared paper, the coating of which is sensitive to light. The sensitive coating consists of gelatine made sensitive to light by immersion in a solution of potassium bichromate; this film afterwards becomes the etching resist. The paper is described as "carbon tissue," and contains a black or brown pigment; special forms of carbon tissue are made for photogravure, the bulk of which is supplied by the Autotype Company. The greatest possible care has to be taken in sensitising the tissue in order to produce uniform results.

The exposure of this film of gelatine on the paper to light under the positive causes a change in the gelatine, making it lose its solubility in hot water, the depth of the insolubility in the gelatine increasing with the amount of light action. In the portions corresponding with the high-lights, therefore, the depths of the insolubility will be the greatest, and this will gradually decrease until in the shadows there will be practically none at all. The carbon tissue is also exposed behind a special form of ruled screen consisting of clear cross lines on an opaque ground, the proportion of the white lines to the black portion being in the ratio of 1 to 4. The effect of this exposure is to form thin, dense cross lines on the tissue; in the etching process, these lines protect the metal and form the walls of the separate cells or cavities that constitute the printing surface. This honeycomb or cellular structure gives great strength to the etched surface, because the "doctor" (the purpose of which is explained in a later part of this paper dealing with machinery) is continuously supported and cannot dip into the cavities.

Photogravure Screens.

The ruling of the screen is usually 150 lines to the lineal inch, but its fineness has no appreciable effect on the ease of printing. On the Continent some work has been done, using a special type of grain screen. The screen itself takes various forms: in some cases engraved screens are used, and in others photographic copies; but the most convenient form is a film ruled screen made on the Continent.

After exposure, the tissue is immersed in water until the gelatine becomes flaccid, and in this condition it is transferred and squeegeed to the previously cleaned polished copper cylinder. The insoluble portions of the gelatine are near the surface of the paper; these are now in contact with the metal and the damp gelatine adheres to it. The cylinder is now revolved in a tank of water and the temperature raised to about 105 deg. F.; the effect of this is to soften the still soluble gelatine so that the paper may be peeled off. By gently laving with hot water the whole of the soluble portions of the gelatine are removed, leaving upon the copper the gelatine print consisting of a thick layer in the light tones, and a thin, easily penetrated layer in the shadows, covered in every portion with the thin screen lines. The gelatine coating on the cylinder is then dried, and all the edges that have not to be etched are protected with an acid-resisting varnish.

In order to minimise the stretching of the paper and consequent lack of register, and for other technical reasons, some forms of tissue may be immersed in a mixture of alco-

Digitized by Google

hol and water, instead of water alone. Methods have also been devised which enable the tissue to be mounted on the cylinder without wetting the paper; the dry tissue is held in position against the cylinder and jets of water are directed between the copper and the gelatine; the cylinder is then revolved and the wetted gelatine brought into contact with its surface with the film of water in between.

The Etching of Cylinders.

The etching of the cylinder is a process of considerable technical interest. The measurements made by the author show that the average thickness of the film in the shadow portions is 1/5,000 in., increasing to a maximum of 3/5,000 in. The etching is controlled by the differences in thickness of the various parts of the gelatine resist, the greatest difference not exceeding 0.0004 in. The etching mordant is a solution of ferric chloride usually treated with ammonia to make it suitable for its purpose. The cylinder and the resist are immersed in the solution of ferric chloride and rotated. After a short time it is noticed that the portion of the copper represented by the shadows turns black, indicating that the ferric chloride has penetrated the thinnest portions of the gelatine, proving that the etching of these portions has begun. If a weak solution of ferric chloride were used, the gelatine would be penetrated through all its different thicknesses in a minute or two, and the work would be rendered useless. The etching is controlled by starting the work with a strong solution—usually 40 deg. B.—and gradually reducing the strength of the etching baths until the high lights are penetrated. The duration of these baths must be decided by experience and the result that is required, and will vary between 25 to 45 minutes. It will be seen that the control of the etching lies in the relative time at which any particular tone is penetrated by the etching solution; this is exercised by the adjustment of the strength of the baths of ferric chloride solution, and is also influenced by their temperature.

In dealing with large cylinders, it is necessary to employ mechanical devices to enable them to be transferred readily between the etching baths of different concentrations.

In a well-organised establishment the schedule time to produce a finished cylinder having a surface 40in. by 56in. is forty-eight working hours from the photographs being received to the completion of the etching. This time includes the separate photographing of the illustrations on each page, and the retouching of the positives. This time could be improved upon for rush work, and, of course, a single subject on a small cylinder could be put through in a few hours.

Type Matter by Photogravure.

It was not until 1904 that type matter was regularly printed from photogravure cylinders, although authentic examples have been shown produced at an earlier date. Dr. Mertens was the proprietor of a patent taken out in 1904 for the reproduction of type matter and illustrations together from rotary intaglio surfaces. This patent was successfully fought in England in 1914, but it still holds in Germany, and royalties continue to be paid in that country to the patentees.

The etching of type matter upon a gravure cylinder presents no technical difficulties. In some cases the impression of the type is taken on the sensitive carbon tissue, which is dusted with bronze powder to make the impression opaque, and the tissue, after a suitable exposure to light, is transferred to the cylinder and etched. A transparency to be used for printing photographically on to the carbon tissue may also be prepared by taking an impression on translucent paper and dusting with bronze powder. The most satisfactory results, however, are usually obtained by preparing a photographic negative and a positive of the type matter, and printing from the latter on to the carbon tissue.

(To be Continued.)

A REPRINT of the sixth edition of "Printing, a Practical Treatise on the Art of Typography, etc.," by Chas. T. Jacobi, is now ready for issue. It is published by Messrs. G. Bell and Sons, Ltd. Crown 8vo., pp. xxiv+429. Price 10s 6d. net.

Trade Notes.

THE *Newcastle Chronicle*.—Arrangements for the change of ownership of the *Newcastle Chronicle* and allied publications are now complete. The new owners are registered as Newcastle Newspapers, Ltd., a private company, with a nominal capital of £100,000. Sir Arthur M. Sutherland, the late chief proprietor, intends to give £25,000 for division among the officials, staff and workmen in appreciation of their services during his five years of ownership.

MESSRS. R. W. CLARK AND CO., printers and stationers, Westgate-road, Newcastle-on-Tyne, needing larger warehouse accommodation, have acquired Fletcher's Buildings, 46-47, Elswick-road.

PARTNERSHIPS dissolved, of which announcement has been made during the week, include those between: W. T. Whitehead and F. R. Halliday, printers and photo engravers, at Red Lion House, Red Lion-court, Fleet-street, E.C.4, under the style of F. R. Halliday and Co.; and S. R. Kerr and E. Heathcott, type founders and engineers, at Canterbury Works, Canterbury-terrace, Balls Pond, N., under the style of G. F. Kerr and Co.

RATING OF MACHINERY.—Mr. N. Chamberlain (Minister of Health), in reply to Mr. Riley (Dewsbury) said in the House of Commons on Thursday that the whole question of the rating of machinery had been the subject of investigation by a committee, the recommendations of which were now under the consideration of the Government. He hoped to introduce legislation dealing with the matter in the course of the present session.

THE last lecture of the series arranged by the Stationers' Company and Printing Industry Technical Board was successfully held at Stationers' Hall on Friday, when the merits of the quill pen, the steel pen and the fountain pen were urged respectively by Messrs. Henry Hill, Wm. B. Mitchell and L. G. Sloan. Mr. Percy Barringer (president of the Stationers' Association of the United Kingdom) made a genial and entertaining chairman.

A MEETING of the Bradford and District Trades and Labour Council was held on Saturday evening for the purpose of discussing a proposal to establish a labour evening newspaper in the district. Delegates expressed themselves in favour of the project, and it was decided to circularise the various affiliated societies with the object of securing support. It was stated that between £75,000 and £100,000 would be necessary for the successful inauguration of the paper.

AT Aberdeen on Friday Peter Wilkie, carrying on business as a printer and stationer under the name "George Leslie," at 18, Adelphi, Aberdeen, was charged with 293 offences under the National Health Insurance and Unemployment Acts by failing to pay the contributions and stamp the cards of certain of his employees. Accused pleaded guilty, and admitted a previous conviction for a similar offence. He was fined £25, or three months' imprisonment. Accused asked time to pay, and the Sheriff granted a week.

IN the House of Lords on Thursday Lord Newton moved the second reading of the Advertisements Regulation Bill. Lord Desborough said that the Government viewed the Bill with favour, and if it reached the House of Commons in its present form they would take its further progress into most favourable consideration. The Bill was read a second time.

THE Parliamentary Press Gallery, at their annual dinner on Friday night at the House of Commons, received as their chief guest the Right Hon. J. Ramsay MacDonald, M.P., the Leader of the Opposition, who was accompanied by Miss Ishbel MacDonald. The Parliamentary Press Gallery also at this annual gathering bade farewell to Mr. R. S. Masson, the late chief of the Parliamentary staff of the *Daily Telegraph*.

MR. GEORGE B. GRIFFITHS, advertisement printer, of the *Westminster Gazette*, died suddenly on Sunday night. Mr. Griffiths had been on the staff of the *Westminster Gazette* over 30 years.

THE death is announced of Mrs. Mascord, wife of Mr. G. W. Mascord, general works superintendent of United Newspaper (1918), Ltd. Mrs. Mascord passed away after a very long and painful illness.

THE death occurred, at his residence in Sale, on Saturday night, of Mr. Barton S. Yates (53), a well-known Cheshire journalist.

Personal.

VISCOUNT HAMBLEDON is to take the chair on Saturday at a banquet to be held at the Hotel Cecil in aid of the funds for the self-contained flats for retired London printers, in connection with the Lloyd Memorial (Caxton) Seaside Home, Deal.

SIR ROWLAND BLADES, M.P., will preside at 1.30 p.m. on Saturday, April 25th, at St. Bride Institute, at the annual general meeting of the Printers' Pension Corporation.

LORD RIDDELL and Lord Provost Montgomery, Glasgow, are to be the guests of Glasgow Publicity at their annual dinner on Friday, March 27th.

MR. J. R. RIDDELL, Principal of the London School of Printing, delivered an interesting and instructive address on the subject of "The Training of the Printer" on Wednesday of last week, at the Caxton Hall, Salford. The meeting—held under the auspices of the Manchester and Salford District of the J.I.C.—was well attended, and the chair was occupied by Mr. Wildman. Following the address a lively discussion took place on many of the points that had been referred to by Mr. Riddell.

MR. W. J. MIZEN, the much-esteemed secretary of the North London Master Printers' Association, was made the recipient of a handsome smoker's cabinet on the occasion of the Association's annual bohemian concert on Tuesday evening.

THE presentation was made by Mr. Alfred Langley on behalf of the members. We hope to publish a fuller report of the proceedings in next week's issue.

BODMIN Town Council has extended congratulations to one of its members, Mr. A. Browning Lyne, editor and proprietor of the *Bodmin Guardian* series of newspapers, on his re-election as Bodmin's representative on the Cornwall County Council.

MR. ANDREW DICKSON, of Newcastle, has just celebrated his 85th birthday. Mr. Dickson is the oldest master printer in the city, and the head of the firm of Andrew Dickson, Ltd., of Hood-street, Newcastle.

MR. P. B. M. ROBERTS and Mr. R. Gray have been re-elected chairman and vice-chairman respectively of the Council of the Newspaper Press Fund.

MR. ROBERT WILLIAMS, secretary of the National Transport Workers' Federation, has been appointed general business manager of the *Daily Herald*, in succession to Mr. George Lansbury.

MR. T. GEDDES, director of the Pearlite Box Co., Ltd., is at present on a trip to South Africa.

MR. FRANK W. CLARKE (Gulf Pulp and Paper Co., Quebec) has been elected president of the Canadian Pulp and Paper Association.

MR. T. KITSON SLEDGE, the president of the National Union of Journalists, was on Saturday entertained at dinner by the Leeds Branch of the Union, and was presented with an inscribed smoking cabinet and a suit-case in recognition of his services to the Union.

MR. C. R. SEDDON, the president, will occupy the chair at the annual dinner of the Papermakers' Association, to-day (Thurs.) at the Connaught Rooms, and amongst those who have intimated their intention of being present are Sir T. Vansittart Bowater, Bt., M.P.; Major the Hon. J. J. Astor, M.P.; Mr. R. T. Nugent, director of the Federation of British Industries; Col. E. F. Lawson, D.S.O., and Mr. W. d'Leny (president of the Waste Paper Merchants' Association).

MR. OLIVER T. BREAKSPEAR, editor of the *Advertisers' Weekly*, has been appointed managing director of the Hong Kong *Daily Press* of which he was formerly manager.

THE late Mr. John Lane, publisher, a director of Messrs. John Lane (The Bodley Head), Ltd., left £15,211.

Christmas Card Publishers Dine.

Sir Adolph Tuck's Merry Party.

Gatti's Restaurant, King William street, Strand, was again on Wednesday last week the scene of one of those delightful annual dinners to which Sir Adolph Tuck is accustomed to invite members and friends of the Association of Publishers of Christmas Cards and Calendars. The function was, as usual, carried out in first class fashion, everything possible being done for the comfort and enjoyment of the guests. The whole of the proceedings—including the speeches, which were short and breezy—combined to make the evening a very pleasing and successful one.

The handsomely printed menu contained cross-word puzzles in connection with which a great deal of fun was forthcoming, and the cross-word craze was also featured in the presenting to each guest of a packet of Messrs. Raphael Tuck and Sons' new cross-word picture post cards.

Amongst those present were: Sir Arthur Conan Doyle, Sir Lawrence Weaver, K.B.E., Mr. Percy Barringer, Mr. Andrew Lyon, Sir Crisp English, K.C.M.G., Dr. Owen Lankester, Mr. Leonard G. Montefiore, Mr. A. Spottiswoode Ritchie, Mr. Claude Taylor, Mr. Herbert Bentwich, Mr. W. R. Codling, C.V.O., C.B.E., Mr. William McKenzie, Mr. G. Delgado, Mr. Louis Wolff, Mr. Graham S. Steel, Mr. Philip Samuel, Mr. Desmond A. Tuck, Mr. W. B. Flatau, and Mr. Harold Goodman.

In bidding his guests a very cordial welcome Sir Adolph Tuck said, with reference to the Association of Publishers of Christmas Cards and Calendars, that its progress in the short period since its formation was a matter of which they had every reason to be proud. The Association had gone from strength to strength, and had done much to assist their friends the retailers throughout the country.

Mr. Percy Barringer, proposing the toast of "The Association of Publishers of Christmas Cards and Calendars," kept his hearers in continual laughter with one of his witty speeches. Speaking in more serious vein, he congratulated the Association on the magnificent success of their campaign to popularise the Christmas card. Everywhere he went he heard remarks that Christmas cards were now better than ever, the sales better than ever, and the advertising arrangements better than ever.

A response was made by Mr. Andrew Lyon who, in the course of an entertaining speech, agreed that they were entitled to treat this toast more enthusiastically than usual as they were certainly making progress. Their advertising campaign was, he felt sure, revolutionising the trade. After some half humorous references to the small profits made by Christmas card publishers, he caused much amusement in very outspokenly criticising some remarks which he said he had seen in a trade journal and which conveyed the inference that publishers did not know what they wanted in the way of words on Christmas cards.

Response was also made by Mr. G. Delgado, who dealt particularly with the advertising campaign, emphasising the advisability of their giving all possible assistance to the retailer in his selling efforts. Mr. Delgado appealed to those publishers who had not yet joined to become members of the Association, and urged all who had joined to increase their efforts for the common good.

The toast of "Our Guests" was happily proposed by Mr. A. Spottiswoode Ritchie, brief responses being made by Sir Conan Doyle, Sir Lawrence Weaver and Dr. Owen Lankester.

The toast of the "Trade Press" was given in a very witty speech by Mr. Desmond A. Tuck, and response was made by Mr. A. E. Owen Jones who in clever and amusing fashion replied to Mr. Lyon's criticism of the trade journalist, not present, who had ventured to suggest the possibility of improving the wording of Christmas cards.

The last toast was that of "The Chairman" given by Mr. William McKenzie. Applause greeted his assertion that Sir Adolph Tuck was to-day the leading figure in their trade, and he went on to recall the early days before the formation of their Association and the work done by Sir Adolph in making their Association possible. He could see nothing that Sir Adolph had done that had not been done with high ideals, to benefit the industry at large. He concluded by paying a tribute to the high standards of production upon which Sir Adolph insisted, his efforts having always been not in the direction of depressing prices but of improving quality. Sir Adolph was to all of them a good friend, a wise counsellor, and a good comrade. (Applause)

During the evening a very enjoyable musical programme was provided by Miss Nellie Beare (soprano), Mr. Charles Treharne (baritone), Mr. Charles Hayes (humorist), with Mr. Will Vaughan at the piano.

Lloyd Memorial (Caxton) Seaside HOME.

Annual Meeting.

The annual meeting of this important trade institution was held on Saturday last at St. Bride Institute, E.C. Viscount Hambleden, in presenting the report and balance-sheets, congratulated the subscribers on the remarkable progress made since the last annual meeting. Not only had the Peace Memorial Wing been finished, but every bed in it had been fully occupied for many months. Although they still had a waiting list there was no delay in admitting any member even remotely connected with the printing, stationery and allied trades. The Home was now second to none, and when he was down at Deal last week he was satisfied that everything was done to secure the comfort of the patients using the Home. The annual report showed that practically the entire cost of furnishing the new Wing was met by donations from trade unions and other societies connected with the trade. No finer tribute to the value of the Home to the employees in the printing and stationery trades could be imagined than a testimonial such as this. On the death of Mr. W. J. Williams a legacy of £52 12s. 7d. has been bequeathed as a memorial to the late Matilda Williams, through the testator, Mr. W. T. Silence. Mr. Harry Lloyd contributed the handsome sum of £2,000, which has been invested and placed to the endowment fund. Over 3,000 persons had been admitted during the year, and some 2,000 new subscribers had been enrolled. The medical, specialists and sanatoria benefits amounted to £1,065 19s. 3d., showing the great use this was to subscribers. Under these circumstances the small railway allowance has been abolished. The entire list of subscriptions together with the balance-sheets have been certified as correct by a chartered accountant.

Altogether, he said, the year under review had been a remarkable one, finishing as it did with an appeal for funds to erect self-contained flats for retired London printers and those from the stationery and allied trades. These flats would contain four rooms and a bath-room and be let at small weekly rent commensurate with the limited income of such persons. It was a scheme both charitable and philanthropic, but not in any sense in competition with other charitable efforts made by similar societies or institutions. He hoped that the banquet at the Hotel Cecil next Saturday would provide sufficient funds to enable the committee to start building during the present year.

The election of officers for the ensuing year concluded the business of the evening, a hearty vote of thanks being accorded to Viscount Hambleden for presiding over the meeting.

Trade Union Matters.

IN accordance with a request from the Printing and Kindred Trades Federation of the United Kingdom the members of the National Union of Journalists have been balloted on the question of whether the following shall, or shall not be made a rule of the National Federation: "For the purpose of giving effect to the objects of the Federation, it shall be necessary for any affiliated union having agreements with an employers' association on wages, grading of districts and towns, hours and holidays, etc., on being approached by any employers' organisation, or themselves desiring to change any such existing agreement, to notify the Executive Committee of any such contemplated change. The Executive Committee shall then notify the affiliated unions of any such proposal received, and shall take any steps they deem desirable to secure unity of action and federated movements."

CHARGED at Barnsley with withholding £46 13s. 9½d., the money of the Barnsley branch of the National Union of Printers and Paper Workers, was Alfred J. Carr, paper worker. Defendant was treasurer of the branch. Mr. J. G. Tingle, secretary of the Union, said that defendant had made a frank confession that he had lost the money by gambling. The man's father offered to repay the money by an immediate instalment of £10 and monthly instalments of £2 The Bench accepted this offer and bound defendant over to be of good behaviour for six months. The father was also bound over in £10 as surety for his son's good behaviour.

SPECIAL PREPAID ADVERTISEMENTS

Payment is accepted, for advertisements under the following headings, on the basis of seven words to the line (minimum three lines):—

Situations Vacant, Agencies,
Machinery for Sale and Wanted,
Businesses for Sale and Wanted,
Partnerships and Investments,
Miscellaneous.

One Insertion	3/0
Three Insertions	6/0

For every line exceeding three lines **6d.**

Situations Wanted.

Under this heading operatives are granted a Special Rate for a minimum of three lines (twenty-one words):—

One Insertion	1/6

Trade Outlook.

REPORTS coming to hand seem to indicate a steady improving tendency in business. As yet, there is not much to shout about, but on the whole there is an encouraging absence of grumbling. It is felt that industry generally is on the move, and naturally the printing and allied trades will benefit. They are already doing so to some extent and there are prospects of still further orders coming their way if only no untoward interruption is allowed to occur.

* * *

Annual Conference.

THIS week the paper industry is taking stock of its position. On the two days, Wednesday and Thursday, several important conferences are being held. The proceedings of the Technical Section occupied attention on the first day. In view of the reports which are coming forward concerning the state of the paper market, rather more encouragement was to be derived from a review of the activities of the technologists than was possible from other fields of action. On the technical side there has been a full twelve months of useful work. The papers read at the various meetings have broken much new ground and have added greatly to the common knowledge. Members have attended the divisional gatherings in greater numbers and there has been keener interest in the discussions. A good deal of spade-work has now been performed, and the deliberations of the several divisions should begin to bear fruit. Signs of this could be seen in the programme for Wednesday's general conference, when the requirements of master printers in regard to the paper they use were presented by Mr. J. R. Riddell and Mr. W. J. Pollock. Both these gentlemen have had long experience in the printing industry and have formed firm opinions with regard to the material upon which they print. Their contributions afforded enlightenment for those who are responsible for the manufacture of the product, with consequent benefit to the selling side.

Printing Trade Crisis.

Strike Action in London.

Employers to Resist Union Attack.

A grave crisis has arisen in the London printing trade. The London branches of the Bookbinders' and Paper Workers' Union have given notice to all the employers in the London Master Printers' Association that the members—male and female—of this union are to withdraw their labour on Tuesday next.

There is danger of the dispute spreading throughout the country, as the Labour Committee of the Federation of Master Printers decided on Tuesday that the attack should be resisted by the whole strength of the Employers' Federation.

The matter at issue in the first place was the rate of wages to be paid on what are described as special machines which are also used in printing offices. Negotiations proceeded for several months, and while they were in progress members of the National Union of Printing, Bookbinding, Machine Ruling and Paper Workers employed by one London firm demanded payment of the rate which had been fixed for machines used mainly in periodical houses in London and declined to work any longer at a lower rate. They went on strike. The dispute was reported to the Joint Industrial Council for the industry, and first the Conciliation Committee and afterwards the full council met to consider the situation. Efforts were made to induce the strikers to return to work, but without avail, and the works of the firm are still closed owing to what is described as "the unconstitutional action of a section of the employees."

The Master Binders' Association of London—an organisation of employers engaged in letterpress and publishers' binding—met last Friday to consider the unconstitutional action of the strikers and gave the union formal notice that if the men concerned did not resume work the services of all other members of the union would be dispensed with. The reply of the union was the issue of strike notices (anticipating the lock-out) on behalf of all its London members, several thousands in number. The enforcement of the notices will, it is stated, virtually bring the general printers and periodical printers of London to a standstill.

The Labour Committee of the Federation of Master Printers, the national organisation, to which the Master Binders' Association of London is affiliated, met on Tuesday and decided to take up the challenge. It was resolved that as the attack on the London firms was entirely unjustified, it should be resisted "by the whole strength of the employers' Federation." The position of the other workers in the industry was considered. They will be made idle as soon as the strike notices take effect. It was suggested that the London employers should point this out to their workpeople. Special meetings of the employers' associations and alliances in the country are to be called immediately in support of the London firms.

AT the Adelphi on Tuesday Mr. C. Dillon McGurk, who is exhibiting woodcuts at the Little Art Rooms, demonstrated before a company of amateurs "how it is done."

INSTITUTE OF JOURNALISTS.—The Council of the Institute of Journalists visited Scotland fot the first time on Saturday, when a series of meetings was held in Glasgow. Mr. Peaker (London), president, presided, and grants were made for the education of orphan children of members. An invitation was extended for holding the annual conference at Cambridge during the last week of August. A special sub-committee was appointed to consider a proposal to define the status of the journalist and the creation of a definite qualification for the profession.

NEWSVENDORS' INSTITUTION.—Publishers, wholesalers and retailers of newspapers, magazines and periodicals, their families, friends and assistants are invited to participate in the proceedings at the annual meeting of the Newsvendors' Benevolent and Provident Institution, at Stationers' Hall, Ludgate-hill, on March 31st. The president, Lord Burnham, will preside. After the business members of *The Times* Musical and Dramatic Society will give a concert.

WEST AND NORTH-WEST

London Master Printers' Association

Three Addresses and an Exhibition.

An interesting and useful meeting was spent by the members of this Association on Monday, when addresses were given by three of the members as follows: Mr. H. W. Searle ("How a Small Printer Can Advertise"), Mr. F. A. Perry ("The Pride of a Printer"), and Mr. P. G. Crannis ("Bad Debts—a Printer's Problem"). The gathering, which was held at the Westbourne Park Institute, Porchester-road, W., was presided over by Mr. R. F. Hunger (president), and there was a moderately good attendance of the members. Among those present were Mr. Alfred Langley (president, L.M.P.A), Mr. E. G. Baker (assistant secretary, L.M.P.A.), and Mr. J. Johnson (organising secretary, L.M.P.A.). Prior to the commencement of the regular proceedings light refreshments were served, the services of Mr. J. Emlyn Jones at this point being much appreciated. It was during this preliminary period that an inspection was made of a comprehensive selection of printing specimens sent in by the members for inclusion in the competition to be held at the Agricultural Hall in May next. The various printing processes employed included litho, letterpress and art copper-plate work, and the following are amongst the firms sending in specimens for the competition: Messrs. Hunt, Barnard and Co., Ltd., A. S. Huth, R. F. Hunger, Westminster Press, A. Holdgate and Sons, Augener, Ltd., Langley and Sons, Morton, Burt and Sons, Sidders and Son, G. Pulman and Sons, Baxter and Ewin, Baines & Scarsbrook Ltd., and W. D. Baxter.

The minutes having been formally disposed of, the chairman called upon the first speaker to address the meeting.

A Small Printer's Advertising.

Mr. Searle proceeded to explain that the reason why he had decided to deal with the subject of "Why a Small Printer Should Advertise" was because he thought that the question had not in the past received sufficient attention. The subjects they generally had before them were most excellent ones and were handled by eminent speakers, but they did not altogether touch the difficulties experienced by the small printer. In their District Association, Mr. Searle went on, they had three different classes of business represented. First there were the large firms who were fully equipped for everything and for every class of work that might come along; secondly, there were the general printers who in varying degrees were able to execute practically any local work from a card to a poster or a volume; then lastly, there was the small man who was, by the way, in the majority of those represented in the District Association. It was to this last section that he wished chiefly to direct his remarks. Dealing with advertising, Mr. Searle considered that advertising by newspaper, by posters, and handbills and in other personal ways to be the best means for the small man to adopt. The speaker then went on to refer to the necessity of a small man specialising in some way or other. If he did not do this he stood a good chance of being squeezed out altogether. Apart from specialising, there were several ways in which one could approach likely customers. Amongst these he suggested showing customers the class of work he could place before them, and suggesting new ideas to customers regarding their requirements. He considered it far more satisfactory to have a small list of satisfied regular customers, than a large one where the customer flitted from one printer to another. While it was necessary for the larger firms to employ canvassers, he did not think it altogether advisable for the smaller ones to do so.

Mr. Searle then showed several specimens of printing that exemplified the work of a small plant. These consisted of handbills, fancy and plain blotters, envelope slips, or "stuffers," as they are called by the Americans. He finally dealt with the value to the small printer of the house organ. This means of advertising, he said, kept the small printer in touch with customers.

He contended that in all advertising one should put service before price, for if one started advertising cheapness one was likely to be left out when a customer required something better. He thought it should be a small printer's endeavour to make people think that he could do the work or supply the goods just as well as the large firms. However, he thought the small printer should know his limitations, and should not attempt a job that he could not do properly or in time. He advised them not to be afraid of telling their customer if the job was too big. Above all, the small printer should realise that good work constituted the best advertisement.

The Noble History of Printing.

Mr. Perry was next called upon to address the meeting, and presented a very able and interesting paper dealing with the history of printing from the early days of its inception. Mr. Perry commenced by saying that it was nearly always the custom of a printer to hide the fact that he was a printer from his fellows. There was no reason for this, he proceeded, because the printer had been the means of bestowing a far more beneficent influence on mankind in general than any craftsman in other sections of industry. He then went back to the genesis of the craft, and spoke of the connection of the printer with the very dim and early days of history. He next referred to the activities of John Cust, Coster, Gutenberg, William Caxton, Aldus Manutius, Christopher Plantin, John Day, and many others of those early times, and explained in an interesting manner the influence exerted for the good of mankind by these famous old printers. He also alluded to the difficulties printers had to contend with against the reactionary Church at that time. After expressing the belief that the Reformation was only made possible by the operations of the printer, the speaker dealt briefly with the work of Bodoni, Franklin Baskerville, William Morris and others. Progress had gone on throughout the ages, and the printer was largely responsible for it. The printer belonged to a great company, and should feel proud of his connections with the craft.

Bad Debts.

Mr. Crannis, the last speaker, in dealing with the subject of the recovery of bad debts, thought that the nature of the printer's business made him peculiarly liable to meet with bad debts. He had not the slightest doubt that since the War there had been more businesses started in the country that in any other similar period, and it was only reasonable to assume that of these more than the average number had resulted in failures. It was, however, very difficult for the printer to steer a clear course and avoid the failures that were always taking place, and the consequent possibility of the printer incurring bad debts. Mr. Crannis next briefly touched on the safeguards to be adopted in the shape of securing deposits, references, status inquiries, etc. In conclusion he mentioned the possibility of forming some kind of a "black list." Such a scheme he thought would not be costly and could be worked from headquarters.

Mr. Sidders, in opening the discussion on Mr. Crannis's address, spoke strongly in favour of the policy of the printer demanding prompt payment for his work in order to prevent the possibility of incurring a bad debt.

A member instanced the advantages secured by a "black list" that was in vogue in another branch of industry, and favoured its adoption by the master printer.

Mr. Langley thought the only way to avoid bad debts was to secure the money that was owing to the printer. With regard to some customers who brought work, if the printer wanted a gamble he would often take the work and run the gambler's risk of securing payment. As regards a "black list" such a thing was illegal, and for that reason was right out of the question. It was often the habit of the printer to give long credit—pretending to his customer that he did not want the money. Such a habit was to be deprecated.

Mr. Goss dealt with the difficulty involved in the recovery of bad debts, and remarked that if the printer was too particular in securing his money, he often ran the risk of restricting trade.

Mr. Baker mentioned the assistance members had derived from the Debt Recovery Section of the L.M.P.A.

Mr. N. E. Davis spoke strongly on the importance of printers insisting on prompt payment for their work.

Mr. J. R. Burt directed the members' attention to the desirability of sending in specimens of their work to be included in the forthcoming competition at the Agricultural Hall. He then advocated a scheme whereby the members of the various district associations could be protected against bad debts.

On the proposition of the chairman a very hearty vote of thanks was accorded to Messrs. Searle, Perry and Crannis for their interesting addresses.

Before the meeting was brought to a close, Mr. Baker drew the attention of those present to the latest phase of the trouble in the industry arising out of the bookbinders' dispute.

A FIRM of manufacturers' agents established in Cape Town, who already represent a number of houses for lines associated with the building trade, desire to secure agencies for glass paper, etc., for the whole of South Africa. (D.O.T., Reference No. 256).

IN consequence of representations from Canada and other quarters, and also of the fact that discussions with Australia are still proceeding, the New Zealand Government has postponed till October 1st the operation of the amended conditions in regard to the admission of goods under the British preferential tariff.

DURING the nine months ended September paper (other than printings) imported into New Zealand amounted to £386,086, against £430,277 in the similar period of the preceding year.

INDEX PRINTING CO., LTD.—Deposit on February 20th, 1925, of deeds (without instrument) of 34 and 36, Bangor-street, and stable and warehouse in Bangor-street, Bolton, to secure all moneys due or to become due from the company to Williams Deacons Bank, Ltd.

AUSTRALIAN ADVERTISING AGENCY, LTD.—Debenture dated February 28th, 1925, to secure £250, charged on the company's property, present and future, including uncalled capital. Holder: A. F. Hitchcock, 108A, Cannon street, E.C.

THOMPSON BROS. (PRINTERS AND STATIONERS), LTD. (Hounslow).—Debenture dated February 17th, 1925, to secure £180, charged on the company's undertaking and property, including uncalled capital. Holders: J. E. Thmopson and Mrs. C. Thompson, 31, Staines-road, Hounslow.

BUSINESS INDICATORS, LTD. (advertising consultants, etc., London).—Issue on March 14th, 1924, of £900 debentures, part of a series already registered. (Notice filed March 3rd, 1925)

SMITH BROS. (BIRMINGHAM), LTD. (paper and paper bag merchants, etc., Birmingham).—Satisfaction to the extent of £525 on February 23rd, 1925, of debenture dated February 3rd, 1922, securing £4,200.

BUCKS ADVERTISER CO., LTD.—Mortgage dated December 11th, 1922, to secure £2,700, charged on freehold property No. 5, Bourbon-street, Aylesbury. Holders: H. P. Bartlett, "Iona," Queen's-road, Cowes; and others. (Registered March 6th by permission of the Court.)

RECEIVER APPOINTED OR RELEASED.

JUPP AND MARTIN, LTD. (manufacturing, wholesale and general stationers, etc., Brighton).—A. G. White, of 14, Old Jewry-chambers, E.C.2, ceased to act as receiver or manager on March 3rd, 1925.

BANKRUPTCIES, etc.

Re WOMEN PUBLISHERS, LTD., 9, Aldwych-Chambers, 170, Strand, W.C.—The creditors and shareholders of this company (in liquidation) met last week at the Carey-street offices of the Board of Trade, Lincoln's-inn, W.C., when accounts were submitted showing unsecured debts £7,167, preferential claims £128, and loans on debenture bonds £1,000; the assets being valued at £1,091. The official receiver reported that the company was formed as a private company in September, 1923, with a nominal capital of £10,000, its objects being to acquire and carry on a business of publishers conducted by Miss Gladys Evelyn Gates, under the style of the Economic Press. Miss Gates was appointed managing director and editor in chief, under an agreement with the company dated September 14th, 1923, and received remuneration at the rate of £500 a year. The issued capital was £6,660. The company's business consisted of the printing and publication of a periodical known as *Everywoman*, the compilation of the Women's Year Book, and Women's Who's Who for 1924-25, and the training of pupils in literary work. Its activities, however, were hampered by shortage of working capital, and its business proved unprofitable throughout. A trading account for the period September 1st, 1923, to July 25th, 1924, showed a net trading loss of £6,351. In April, 1924, the directors were unsuccessful in their efforts to raise further working capital by the issue of shares, and debentures were subsequently issued. The publication of *Everywoman* ceased at the beginning of July, 1924, and on July 23rd, 1924, it was resolved that the company should go into voluntary liquidation. The failure was due to the fact that its organisation and projects were framed on too ambitious lines for its limited resources. The official receiver remained in charge of the liquidation.

A REPORT of the International Paper Co. relating to output statistics shows that the company and its subsidiaries produced in 1924 a total of 434,288 tons of various grades of paper. This is substantially under the total output for 1923, which reached the record figure of 537,927 tons.

Offset Printing Paper.

Problems that Face the User.

In a recent issue of "Printing" (N.Y.), there were given the views of a practical lithographer on some of the difficulties which arise in the use of offset printing paper.

It should be borne in mind that paper is made by human beings and that the character of the papermaker and his employer's policies are interwoven into the sheet as closely as the fibres themselves, and are no more easily removed. Any one of the different classes of paper from onion skin to blotting can be successfully run, but we cannot successfully run all of the brands in any one class. Needless to say that we usually find that the stock which gives greatest satisfaction is made by a man who has also made a study of our trials and tribulations.

Moisture Absorption.

Book papers and most bonds contain either chemical wood or ground wood, and it is this which gives the offset pressman the most trouble. You have noticed how a desk drawer will stick in damp weather owing to the wood having absorbed an undue amount of moisture from the atmosphere, which causes a swelling of the wood fibres and an actual increase in the size of the drawer itself. Grinding the wood, or cooking it until only the cellular matter remains does not seem to alter this characteristic of the fibre. As soon as the paper is subjected to the atmosphere of a pressroom where the humidity is greater than it was in the room in which the paper was made the wood fibres begin to absorb moisture and swell.

Now if every fibre in the sheet could be depended upon to swell at the same time the result would be merely an increase in the size of the sheet. The fibres, however, begin to take moisture from the edge of the sheet and work in towards the centre. Whether this is due to the sizing covering the surface of the paper allowing moisture to seep in at the edges before it does on the surface is a question which the writer cannot answer, but it seems likely. The result of this uneven swelling is a fluted edge where the grain runs parallel to the edge and a tendency to curl with the other dimension. You can make a demonstration of the foregoing by moistening the top and side of a letter head. This experiment will show, in exaggerated form, the action of the fibres.

Humidity in the Pressroom.

Of course, as long as the sheet is kept in the same degree of humidity it will continue to take in moisture from its edges, passing it along to the centre, until all of the fibres have absorbed the same degree of moisture. At this juncture all wrinkles caused from swelling will disappear and the sheet will have returned to a perfect parallelogram. It can now be run on the press without trouble. Usually a ten day period is sufficient for paper in racks to overcome the inequalities of moisture content in its fibres. Obviously, if it is left in stacks the pressure will prevent the lower reams from adjusting themselves at the same rate as the paper on top and the stock will not make a very satisfactory run. Please do not infer from this that paper cannot be taken direct from a stack and be run. There are many inexpensive papers, as well as fine grades, which seem to be made in just the right degree of humidity to permit them being stacked in your stock room for months without undergoing a change. The paper which acts best for you may be a Jonah for a lithographer in another town. The best papermakers cannot control the humidity in your pressroom, and the most expensive bonds sometimes behave worse than a ten cent. sheet.

Some pressmen refer to troublesome stock as "green." It is not green, in the writer's opinion, in the sense that it is too fresh from the mill. The trouble is that it has met with experiences on the way from the mill that have put the very devil in it. The next time you ride a long way on the train take account of the number of temperature changes, rainstorms, etc., that you encounter, and then try and imagine what effect these influences have on your paper when it travels over the same route. Your problem is to "bring it back" to the condition it was in when it left the mill and letting nature take its course seems to be a good solution.

"Bone Dry" Process.

It will be noticed that the writer has not referred to the application of heat during the process of racking. This might be called the "Bone Dry" process, as it drives out the moisture and renders the sheet as dry as it was when delivered from the machine. It accomplishes just the reverse of the absorption method inasmuch as it is a shrinking of the affected fibres only and not a normal swelling of all. It is obvious that if a stock that is to be used for colour work has a tendency to "go out" and that it is treated by the heat method that as soon as it has run through the press on the first colour it must be returned to the racks or it will go out again and the register will be off. With the absorption method only one racking is necessary.

Wrinkles.

Some may infer from the foregoing that racking is a cure-all for paper troubles. There is one kind of wrinkling, however, that no amount of racking can take out and that is the wrinkles put in at the mill. Fortunately, only a few of the so-called medium grades of bonds and some books have them. It is much better to use a sheet of small rag content which has been well made than a more expensive stock which was sold cheap because it was made fast. Very often you have found a cheap un-watermarked sulphite giving good production on one press and really good paper bucking up on another not ten feet away. The writer has not found any method of getting rid of wrinkles which have been fabricated into the paper.

Even though paper be thoroughly racked and put in condition before being placed on the feeder, there is often a great deal of trouble experienced through the paper stretching when it passes through the impression rolls. If the grain of the paper runs the long way the greatest dimension will have the greatest resistance to atmospheric and mechanical influences. There is another reason for having the grain running the long way which the writer thinks is a very good one. As the susceptibility to mechanical influence is greater across the grain than with it, it is obvious that there would be a greater tendency to stretch across the grain than with it. As the gripper edge is always the larger dimension, if the grain ran the long way, the paper would stretch around the cylinder. If, in colour work, the register was destroyed by undue stretch, or a change in atmospheric conditions occurring since the run was started, it could be brought back by laying several sheets of paper under the blanket, thus increasing its circumference and delaying slightly the impression away from the gripper edge of the sheet. If it is to our interest to have paper with the grain running the long way and we let our wants be known to the papermakers we will soon be better off.

Merton Board Mill, Ltd.

Receiver Appointed.

In the Chancery Division last week, Mr Justice Romer made an order appointing a receiver of the assets of the Merton Board Mill, Ltd., on the application of the Treasury Solicitor.

Mr. Carr, for the applicant, said his Lordship made an order last week for the compulsory winding-up of the company and this was a motion in a debenture holder's action.

His Lordship: The money is due and you got leave to proceed with this action?

Mr. Carr: Yes. The official receiver does not appear and the second mortgagee (an insurance company) does not appear, and I ask for the appointment of a named person as receiver.

His Lordship: The person who has been acting is still in possession?

Mr. Carr: Yes. I ask leave for him to act at once.

His Lordship: Is he going to manage the business?

Mr. Carr: Yes.

His Lordship: What is the company's business?

Mr. Carr: Manufacturers of cards and millboards. We shall have to sell the business, and the only question is whether we can sell it as a going concern.

China's Paper Market.

Demand for Foreign-Style Paper.

Emphasising the remarkable growth in the demand in China for foreign-style paper during the past ten years, Dr. Julius Klein, director of the Bureau of Foreign and Domestic Commerce, U.S.A., states that China's paper imports had increased from 32,352 tons in 1912 to an annual average of 80,022 tons during the last four years. The United States increased its share in this trade from 373 tons, or less than 0·5 per cent. of the 1913 imports, to an average of 9,186 tons annually since 1920, or for 1923 alone, to 8 per cent. of the total paper imports.

Foreign paper meets little competition from the domestic product in China, except in a few lines, such as wrapping paper and strawboard. American papers in most demand are the better grades, particularly of bond and bank-note papers. The fluctuating exchange conditions and the generally higher level of American prices have had a restraining effect on the sale of papers from the United States. Aside from these two factors, however, American papers enjoy a favoured position in the market because of their high quality and the accessibility of the Chinese market to the West Coast of the United States.

The Principal Factor.

Japan is the principal factor in the paper trade at present, particularly in the cheaper grades, because of Japan's advantage in its proximity and in the consequent lower freight rates and quicker deliveries. Germany and Italy, however, made notable progress in their paper imports during 1922 and 1923, Germany taking a considerable step toward regaining its pre war prominence, while Italy, negligible in 1913, supplied nearly 7,000 tons of paper, valued at £149,000 in 1923.

The class of foreign-made paper in most demand is a white, unsized news print, suitable for printing books, newspapers, posters and handbills. The paper is imported—largely from Japan and European countries—in bales of 12 reams, 500 sheets to the ream. It is essential that there be as nearly 500 sheets in the ream as possible, for the Chinese customer counts them and is dissatisfied if the number does not accord with the specifications.

Russian Paper Industry.

The production of the mills in the Central Paper Trust for the first quarter of the financial year ended with December was 16,806 tons of paper, or 92 per cent. of the average productive programme for 1924-25, 338 tons of carton or 114 per cent.; 10,573 tons of cellulose or 104 per cent., and 1,534 tons of wood pulp or 100 per cent. of the programme.

The schedule of production for the current year (1924-25) is higher on the average by 50 per cent. than that in the preceding year and 15 per cent. more than the output in the quarter terminated with last September.

A report of the industrial section of the State Planning Commission, comments on the growth of paper imports. Reference was also made to the fact that 25,765 persons were engaged in turning out a production corresponding to 68 per cent. of that in 1913, whereas in the pre-war it was only necessary to employ 21,700 workpeople for the 100 per cent. production. Costs of production, again, are high, being 5.3 roubles per pood of paper now, as compared with 3 3 roubles in the pre-war period.

Total expenditure on capital account in the paper industry for the present year is to be 5,677,000 roubles, mostly for the Central Trust. The total income is estimated at 7,310,000 roubles.

THE death has taken place at Greenhithe, of Mr. James, a highly respected employee of the Empire Paper Mills (1922), Ltd. He was formerly employed at the Darwen Mills of Messrs. Potter and Co., which were incorporated in the Wall-Paper Manufacturers, Ltd., and then transferred to Greenhithe 17 years ago, when the Empire Mills were completed.

MISS SARAH SCHOLES WRIGLEY, of The Wood, Windermere, daughter of the late Mr. James Wrigley, who died on December 26th last, left gross estate of the value of £134,021, with net personalty £133,199.

Paper in British West Indies.

The position which paper and stationery occupy in the markets of the British West Indies and other British possessions contiguous thereto is indicated in a report of the economic and financial conditions in those countries which has been prepared by Mr. J. L. Wilson Goode, H.M. Trade Commissioner. Issued by the Department of Overseas Trade, the report is obainable from H.M. Stationery Office, price 1s. 7d. post free.

In a summary of the state of demand for certain articles, with special reference to British trade, the following appears concerning paper and stationery: "In both these trades the question of price is of paramount importance and there is practically no demand for high-class productions. America has most of the trade in typewriting materials and pencils and Holland in strawboards, but in other lines cheap British goods are in fair demand, though many of them have to compete with job lines from other countries."

Paper (including playing cards) imports into Barbados in 1923 totalled £18,918, divided between the United Kingdom, £7,459; Holland, £5,771; U.S.A., £4,255; Canada, £713. The British figure is an increase on that of 1922, while the other three countries mentioned have lower figures. Of stationery other that paper, the United Kingdom supplied £3,847 of the £4,804 received.

British Guiana imported £35,094 worth of paper, supplies coming from the United Kingdom, £16,047; Holland, £10,981; U.S.A., £3,480; Canada, £2,140; Other Countries, £2,746. Only this country and Holland show increases on 1922. Most of the stationery came from the United Kingdom, namely £4,373 out of £5,934.

Trinidad and Tobago imported paper to the extent of £51,636 last year as follows: United Kingdom, £15,588; Holland, £15,995; U.S.A., £10,895; Canada, £4,851; Other, £4,307. Only Holland's figures were increased. England's share of the £16,044 worth of stationery other than paper was £11,265.

Jamaica's trade in paper, valued at £72,708, was distributed thus: United Kingdom, £21,780; U.S.A., £23,667; Canada, £12,004; Holland, £11,096; Other, £4,161. The United States and Holland were alone to show larger figures in 1923. Stationery other than paper imported amounted to £20,486, the United Kingdom being credited with £10,368.

A Watermark Speech.

At the staff dinner of Messrs. Wiggins, Teape and Alex. Pirie (Sales), Ltd., held recently at the Connaught Rooms, Mr. H. E. Poole (B. J. Ball, Ltd.), introduced into his speech, in replying for the visitors, an ingenious skit on the numerous watermarks held by the firm. This part of Mr. Poole's speech was as follows:—

The PERFECT ART of living lies in a capacity to meet our troubles (whether they be one or *3009*) with the strength of a HERCULES, so that, as the CONQUEROR of our fates, we shall prove ourselves EXTRA STRONG in overcoming them. So shall we stand four square to any complaints, come they from places so far apart as DEVON VALLEY or that distant land of the SOUTHERN CROSS. With manners HIGHLY SENSITISED and smooth as ALABASTER IVORY, sticking to our WHITE PARTNER like PIRIE'S GUMMED, we have fair dealing as the OFFICIAL BOND between us and our customers.

Thus from the land of the ROYAL BUCKS to those industrial centres of LANCASHIRE we shall prove that the ORIGINAL GOVERNMENT of our firm was along sound progressive lines, and BLOTTING out the memory of trade depression, we shall see to it that in the struggle for more and bigger orders we shall be the VICTOR. No MEDIUM success will satisfy, nor shall the FOOLSCAP be put upon our heads; but ROYAL—nay, DOUBLE ROYAL—will be the welcome accorded the W.T. & A.P. policy throughout the land. What do these magic letters signify? Surely nothing less than Well Tried and Approved Performance.

Coming to our directorare, it is an axiom of the firm to make HAY while the sun shines. In the conduct of affairs they neither BAR LOW nor high, but all are treated alike. When opportunity lies in the path there lies LAY to apture it; and the tenacity with which a olicy once settled is followed, is exemplified by the remark of one our Devonshire hands, "When we've gotten we'll HOLD'UN." It APIRIES to me that such a BOARD is the true INDEX of faith in our own future.

And then at last, when our LEDGER is balanced, and we are LAID to rest, we can thank those who WOVE the fabric of our business with such care; for they, with the strength of an ATLAS have carried the STANDARD for over a century. Their efforts have reached the high WATERMARK of success, as the LARGE POST (both town and country) daily testifies. Whether we have crossed the JORDAN or only the ST. LAWRENCE we have been through the MILL together; and while scorning to copy others, we are content to be the DUPLICATORS of our own success.

Paper Industry of Jugo-Slavia.

Although Jugo-Slavia possesses such wealth of timber, the manufacture of paper is limited to seven concerns, states the *Central European Observer*. Three of these have started operations only since the close of the war. Up to 1914 Serbia itself possessed no paper mills, but in 1918 the new Kingdom of the Serbs, Croats and Slovenes acquired the four that existed on territory previously belonging to the Austro-Hungarian empire. Practically all kinds of paper are made, but some of the raw material (cellulose) has to be imported, with the result that costs of production are increased.

The United Mills of Vevce, Gorcane and Medvode, with a capacity of 900 tons monthly, are the largest concern; the Radece Mills, turning out 50 tons of paper and cardboard monthly, are the oldest in the country. The only factory in Serbia proper is one recently erected by German engineers on Reparations account, in which the State has subscribed half of the capital. Other mills exist at Susak, Domzale, Zagreb and Slatka Gora. The total capacity is about 20,000 tons per annum, but consumption is under the pre-war level, and foreign competition, despite protective duties, plays a considerable rôle.

NATURE'S supplies must be paid for in nature's currency—work.

Offset Printing Paper.

Problems that Face the User.

In a recent issue of "Printing" (N.Y.), there were given the views of a practical lithographer on some of the difficulties which arise in the use of offset printing paper.

It should be borne in mind that paper is made by human beings and that the character of the papermaker and his employer's policies are interwoven into the sheet as closely as the fibres themselves, and are no more easily removed. Any one of the different classes of paper from onion skin to blotting can be successfully run, but we cannot successfully run all of the brands in any one class. Needless to say that we usually find that the stock which gives greatest satisfaction is made by a man who has also made a study of our trials and tribulations.

Moisture Absorption.

Book papers and most bonds contain either chemical wood or ground wood, and it is this which gives the offset pressman the most trouble. You have noticed how a desk drawer will stick in damp weather owing to the wood having absorbed an undue amount of moisture from the atmosphere, which causes a swelling of the wood fibres and an actual increase in the size of the drawer itself. Grinding the wood, or cooking it until only the cellular matter remains does not seem to alter this characteristic of the fibre. As soon as the paper is subjected to the atmosphere of a pressroom where the humidity is greater than it was in the room in which the paper was made the wood fibres begin to absorb moisture and swell.

Now if every fibre in the sheet could be depended upon to swell at the same time the result would be merely an increase in the size of the sheet. The fibres, however, begin to take moisture from the edge of the sheet and work in towards the centre. Whether this is due to the sizing covering the surface of the paper allowing moisture to seep in at the edges before it does on the surface is a question which the writer cannot answer, but it seems likely. The result of this uneven swelling is a fluted edge where the grain runs parallel to the edge and a tendency to curl with the other dimension. You can make a demonstration of the foregoing by moistening the top and side of a letter head. This experiment will show, in exaggerated form, the action of the fibres.

Humidity in the Pressroom.

Of course, as long as the sheet is kept in the same degree of humidity it will continue to take in moisture from its edges, passing it along to the centre, until all of the fibres have absorbed the same degree of moisture. At this juncture all wrinkles caused from swelling will disappear and the sheet will have returned to a perfect parallelogram. It can now be run on the press without trouble. Usually a ten day period is sufficient for paper in racks to overcome the inequalities of moisture content in its fibres. Obviously, if it is left in stacks the pressure will prevent the lower reams from adjusting themselves at the same rate as the paper on top and the stock will not make a very satisfactory run. Please do not infer from this that paper cannot be taken direct from a stack and be run. There are many inexpensive papers, as well as fine grades, which seem to be made in just the right degree of humidity to permit them being stacked in your stock room for months without undergoing a change. The paper which acts best for you may be a Jonah for a lithographer in another town. The best papermakers cannot control the humidity in your pressroom, and the most expensive bonds sometimes behave worse than a ten cent. sheet.

Some pressmen refer to troublesome stock as "green." It is not green, in the writer's opinion, in the sense that it is too fresh from the mill. The trouble is that it has met with experiences on the way from the mill that have put the very devil in it. The next time you ride a long way on the train take account of the number of temperature changes, rainstorms, etc., that you encounter, and then try and imagine what effect these influences have on your paper when it travels over the same route. Your problem is to "bring it back" to the condition it was in when it left the mill and letting nature take its course seems to be a good solution.

"Bone Dry" Process.

It will be noticed that the writer has not referred to the application of heat during the process of racking. This might be called the "Bone Dry" process, as it drives out the moisture and renders the sheet as dry as it was when delivered from the machine. It accomplishes just the reverse of the absorption method inasmuch as it is a shrinking of the affected fibres only and not a normal swelling of all. It is obvious that if a stock that is to be used for colour work has a tendency to "go out" and that it is treated by the heat method that as soon as it has run through the press on the first colour it must be returned to the racks or it will go out again and the register will be off. With the absorption method only one racking is necessary.

Wrinkles.

Some may infer from the foregoing that racking is a cure-all for paper troubles. There is one kind of wrinkling, however, that no amount of racking can take out and that is the wrinkles put in at the mill. Fortunately, only a few of the so-called medium grades of bonds and some books have them. It is much better to use a sheet of small rag content which has been well made than a more expensive stock which was sold cheap because it was made fast. Very often you have found a cheap un-watermarked sulphite giving good production on one press and really good paper bucking up on another not ten feet away. The writer has not found any method of getting rid of wrinkles which have been fabricated into the paper.

Even though paper be thoroughly racked and put in condition before being placed on the feeder, there is often a great deal of trouble experienced through the paper stretching when it passes through the impression rolls. If the grain of the paper runs the long way the greatest dimension will have the greatest resistance to atmospheric and mechanical influences. There is another reason for having the grain running the long way which the writer thinks is a very good one. As the susceptibility to mechanical influence is greater across the grain than with it, it is obvious that there would be a greater tendency to stretch across the grain than with it. As the gripper edge is always the larger dimension, if the grain ran the long way, the paper would stretch around the cylinder. If, in colour work, the register was destroyed by undue stretch, or a change in atmospheric conditions occurring since the run was started, it could be brought back by laying several sheets of paper under the blanket, thus increasing its circumference and delaying slightly the impression away from the gripper edge of the sheet. If it is to our interest to have paper with the grain running the long way and we let our wants be known to the papermakers we will soon be better off.

Merton Board Mill, Ltd.

Receiver Appointed.

In the Chancery Division last week, Mr Justice Romer made an order appointing a receiver of the assets of the Merton Board Mill, Ltd., on the application of the Treasury Solicitor.

Mr. Carr, for the applicant, said his Lordship made an order last week for the compulsory winding-up of the company and this was a motion in a debenture holder's action.

His Lordship: The money is due and you got leave to proceed with this action?

Mr. Carr: Yes. The official receiver does not appear and the second mortgagee (an insurance company) does not appear, and I ask for the appointment of a named person as receiver.

His Lordship: The person who has been acting is still in possession?

Mr. Carr: Yes. I ask leave for him to act at once.

His Lordship: Is he going to manage the business?

Mr. Carr: Yes.

His Lordship: What is the company's business?

Mr. Carr: Manufacturers of cards and millboards. We shall have to sell the business, and the only question is whether we can sell it as a going concern.

China's Paper Market.

Demand for Foreign-Style Paper.

Emphasising the remarkable growth in the demand in China for foreign-style paper during the past ten years, Dr. Julius Klein, director of the Bureau of Foreign and Domestic Commerce, U.S.A., states that China's paper imports had increased from 32,352 tons in 1912 to an annual average of 80,022 tons during the last four years. The United States increased its share in this trade from 373 tons, or less than 0·5 per cent. of the 1913 imports, to an average of 9,186 tons annually since 1920, or for 1923 alone, to 8 per cent. of the total paper imports.

Foreign paper meets little competition from the domestic product in China, except in a few lines, such as wrapping paper and strawboard. American papers in most demand are the better grades, particularly of bond and bank-note papers. The fluctuating exchange conditions and the generally higher level of American prices have had a restraining effect on the sale of papers from the United States. Aside from these two factors, however, American papers enjoy a favoured position in the market because of their high quality and the accessibility of the Chinese market to the West Coast of the United States.

The Principal Factor.

Japan is the principal factor in the paper trade at present, particularly in the cheaper grades, because of Japan's advantage in its proximity and in the consequent lower freight rates and quicker deliveries. Germany and Italy, however, made notable progress in their paper imports during 1922 and 1923, Germany taking a considerable step toward regaining its pre war prominence, while Italy, negligible in 1913, supplied nearly 7,000 tons of paper, valued at £149,000 in 1923.

The class of foreign-made paper in most demand is a white, unsized news print, suitable for printing books, newspapers, posters and handbills. The paper is imported—largely from Japan and European countries—in bales of 12 reams, 500 sheets to the ream. It is essential that there be as nearly 500 sheets in the ream as possible, for the Chinese customer counts them and is dissatisfied if the number does not accord with the specifications.

Russian Paper Industry.

The production of the mills in the Central Paper Trust for the first quarter of the financial year ended with December was 16,806 tons of paper, or 92 per cent. of the average productive programme for 1924-25, 338 tons of carton or 114 per cent.; 10,573 tons of cellulose or 104 per cent., and 1,534 tons of wood pulp or 100 per cent. of the programme.

The schedule of production for the current year (1924-25) is higher on the average by 50 per cent. than that in the preceding year and 15 per cent. more than the output in the quarter terminated with last September.

A report of the industrial section of the State Planning Commission, comments on the growth of paper imports. Reference was also made to the fact that 25,765 persons were engaged in turning out a production corresponding to 68 per cent. of that in 1913, whereas in the pre-war it was only necessary to employ 21,700 workpeople for the 100 per cent. production. Costs of production, again, are high, being 5·3 roubles per pood of paper now, as compared with 3·3 roubles in the pre-war period.

Total expenditure on capital account in the paper industry for the present year is to be 5,677,000 roubles, mostly for the Central Trust. The total income is estimated at 7,310,000 roubles.

THE death has taken place at Greenhithe, of Mr. James, a highly respected employee of the Empire Paper Mills (1922), Ltd. He was formerly employed at the Darwen Mills of Messrs. Potter and Co., which were incorporated in the Wall-Paper Manufacturers, Ltd., and then transferred to Greenhithe 17 years ago, when the Empire Mills were completed.

MISS SARAH SCHOLES WRIGLEY, of The Wood, Windermere, daughter of the late Mr. James Wrigley, who died on December 26th last, left gross estate of the value of £134,021, with net personalty £133,199.

Paper in British West Indies.

The position which paper and stationery occupy in the markets of the British West Indies and other British possessions contiguous thereto is indicated in a report of the economic and financial conditions in those countries which has been prepared by Mr. J. L. Wilson Goode, H.M. Trade Commissioner. Issued by the Department of Overseas Trade, the report is obainable from H.M. Stationery Office, price 1s. 7d. post free.

In a summary of the state of demand for certain articles, with special reference to British trade, the following appears concerning paper and stationery: "In both these trades the question of price is of paramount importance and there is practically no demand for high-class productions. America has most of the trade in typewriting materials and pencils and Holland in strawboards, but in other lines cheap British goods are in fair demand, though many of them have to compete with job lines from other countries."

Paper (including playing cards) imports into Barbados in 1923 totalled £18,918, divided between the United Kingdom, £7,459; Holland, £5,771; U.S.A., £4,255; Canada, £713. The British figure is an increase on that of 1922, while the other three countries mentioned have lower figures. Of stationery other that paper, the United Kingdom supplied £3,847 of the £4,804 received.

British Guiana imported £35,094 worth of paper, supplies coming from the United Kingdom, £16,047; Holland, £10,981; U.S.A., £3,480; Canada, £2,140; Other Countries, £2,746. Only this country and Holland show increases on 1922. Most of the stationery came from the United Kingdom, namely £4,373 out of £5,934.

Trinidad and Tobago imported paper to the extent of £51,636 last year as follows: United Kingdom, £15,588; Holland, £15,995; U.S.A., £10,895; Canada, £4,851; Other, £4,307. Only Holland's figures were increased. England's share of the £16,044 worth of stationery other than paper was £11,265.

Jamaica's trade in paper, valued at £72,708, was distributed thus: United Kingdom, £21,780; U.S.A., £23,667; Canada, £12,004; Holland, £11,096; Other, £4,161. The United States and Holland were alone to show larger figures in 1923. Stationery other than paper imported amounted to £20,486, the United Kingdom being credited with £10,368.

A Watermark Speech.

At the staff dinner of Messrs. Wiggins, Teape and Alex. Pirie (Sales), Ltd., held recently at the Connaught Rooms, Mr. H. E. Poole (B. J. Ball, Ltd.), introduced into his speech, in replying for the visitors, an ingenious skit on the numerous watermarks held by the firm. This part of Mr. Poole's speech was as follows:—

The PERFECT ART of living lies in a capacity to meet our troubles (whether they be one or *3009*) with the strength of a HERCULES, so that, as the CONQUEROR of our fates, we shall prove ourselves EXTRA STRONG in overcoming them. So shall we stand four square to any complaints, come they from places so far apart as DEVON VALLEY or that distant land of the SOUTHERN CROSS. With manners HIGHLY SENSITISED and smooth as ALABASTER IVORY, sticking to our WHITE PARTNER like PIRIE'S GUMMED, we have fair dealing as the OFFICIAL BOND between us and our customers.

Thus from the land of the ROYAL BUCKS to those industrial centres of LANCASHIRE we shall prove that the ORIGINAL GOVERNMENT of our firm was along sound progressive lines, and BLOTTING out the memory of trade depression, we shall see to it that in the struggle for more and bigger orders we shall be the VICTOR. No MEDIUM success will satisfy, nor shall the FOOLSCAP be put upon our heads; but ROYAL—nay, DOUBLE ROYAL—will be the welcome accorded the W.T. & A.P. policy throughout the land. What do these magic letters signify? Surely nothing less than Well Tried and Approved Performance.

Coming to our directorare, it is an axiom of the firm to make HAY while the sun shines. In the conduct of affairs they neither BAR LOW nor high, but all are treated alike. When opportunity lies in the path there lies LAY to apture it; and the tenacity with which a olicy once settled is followed, is exemplified by the remark of one our Devonshire hands, "When we've gotten we'll HOLD'UN." It APIRIES to me that such a BOARD is the true INDEX of faith in our own future.

And then at last, when our LEDGER is balanced, and we are LAID to rest, we can thank those who WOVE the fabric of our business with such care; for they, with the strength of an ATLAS have carried the STANDARD for over a century. Their efforts have reached the high WATERMARK of success, as the LARGE POST (both town and country) daily testifies. Whether we have crossed the JORDAN or only the ST. LAWRENCE we have been through the MILL together; and while scorning to copy others, we are content to be the DUPLICATORS of our own success.

Paper Industry of Jugo-Slavia.

Although Jugo-Slavia possesses such wealth of timber, the manufacture of paper is limited to seven concerns, states the *Central European Observer*. Three of these have started operations only since the close of the war. Up to 1914 Serbia itself possessed no paper mills, but in 1918 the new Kingdom of the Serbs, Croats and Slovenes acquired the four that existed on territory previously belonging to the Austro-Hungarian empire. Practically all kinds of paper are made, but some of the raw material (cellulose) has to be imported, with the result that costs of production are increased.

The United Mills of Vevce, Gorcane and Medvode, with a capacity of 900 tons monthly, are the largest concern; the Radece Mills, turning out 50 tons of paper and cardboard monthly, are the oldest in the country. The only factory in Serbia proper is one recently erected by German engineers on Reparations account, in which the State has subscribed half of the capital. Other mills exist at Susak, Domzale, Zagreb and Slatka Gora. The total capacity is about 20,000 tons per annum, but consumption is under the pre-war level, and foreign competition, despite protective duties, plays a considerable rôle.

NATURE'S supplies must be paid for in nature's currency—work.

Union Membership at Paper Mills.

Agreement at "Daily Telegraph" Works.

Following negotiations which have been in progress since September last on the question of union labour at the *Daily Telegraph* Paper Mills, Dartford, an agreement was reached last week between the National Union of Printing, Bookbinding, Machine Ruling and Paper Workers and the proprietors of the mills. The terms of the agreement are set out below.

Notices had been originally tendered on September 5th that if remaining non-unionists did not join the National Union, members of that Union would refuse to work with them. After an interview with the representatives of the proprietors it was agreed to suspend these notices.

Subsequently the National Executive Council of the Union instructed Mr. Wm. Ross to proceed to Dartford with the London Central Branch secretary, Mr. Geo. Larcey, and as a result it was agreed that notices be again tendered, to terminate on March 7th

Mr. Ross and Mr. Large (organiser of the National Union) attended at the mill gates on Monday, and there were certain abstensions from the shifts.

In the meantime Mr. Larcey had been carrying on negotiations in London, and notices were tendered respecting members employed at the *Daily Telegraph* offices in Fleet-street.

Eventually, after conferences in London and Dartford, the following draft agreement, which had been drawn up by Mr. Ross, was considered and accepted in its entirety:—

> It is hereby agreed between the representatives of the *Daily Telegraph* Paper Mills on the one part and representatives of the National Union of Printing, Bookbinding, Machine Ruling and Paper Workers on the other part:
>
> 1. That in future this mill shall be fully recognised as a trade union mill and that every employee other than craftsmen and those who were members of the Amalgamated Society of Papermakers at September 13th, 1924, must hold a card in the Union making this agreement and keep same clear of arrears.
>
> 2. That every worker who came out on strike shall be reinstated in the same position and that no victimisation shall follow.
>
> 3. To facilitate the collection of dues to this Union and avoidance of trouble through arrears of contribution a room shall be provided where the branch secretary and Father of the Chapel can collect the members' contributions weekly as they come on or leave work and that time shall be granted to these officials to be at such room or office to collect dues from members on each of the three shifts weekly.
>
> 4. In the event of the National Union of Printing, Bookbinding, Machine Ruling and Paper Workers not being able to provide a suitable man to fill a vacancy the card of an Amalgamated Society member with twelve months membership or over will be recognised.
>
> 5. Any grievance of any member or members must be reported to either of these branch officials, who, if they consider same requires discussion with the management shall request an interview for the purpose and report to the branch committee.

The agreement was signed for the proprietors of the *Daily Telegraph* Paper Mills by Mr. Philip T. Goldney, and for the National Union of Printing, Bookbinding, Machine Ruling and Paper Workers by Mr. William Ross, sectional general secretary, and Mr. A. Large, southern organiser.

We understand that the mill closed at midnight on Monday, but work was resumed at 6 o'clock on Wednesday.

DAVIES AND ROYLE, LTD., have been appointed selling agents (with the exception of London) for Carl P. Fues Papierfabrik A.-G., Hanau a/Maine, Germany. This mill are manufacturing high-grade qualities of glazed transparent greaseproofs, bleached, unbleached and coloured, unglazed bleached greaseproof papers, detail tracing papers, vegetable parchment substitute, waterproof export packing, etc.

Readers' Pensions Committee.

Annual Meeting.

The annual meetings of the Readers' Pensions Committee, which exists for the purpose of securing pensions for aged printers' readers and the widows of readers (through the agency of the Printers' Pension Corporation), was held at St. Bride Institute on Saturday last. There was a large attendance, with Mr. W. A. Perkins in the chair. About 30 new members were elected.

The chairman, in presenting the annual report, summarised some of the proceedings of the year, and commented shortly on the various matters mentioned in the report.

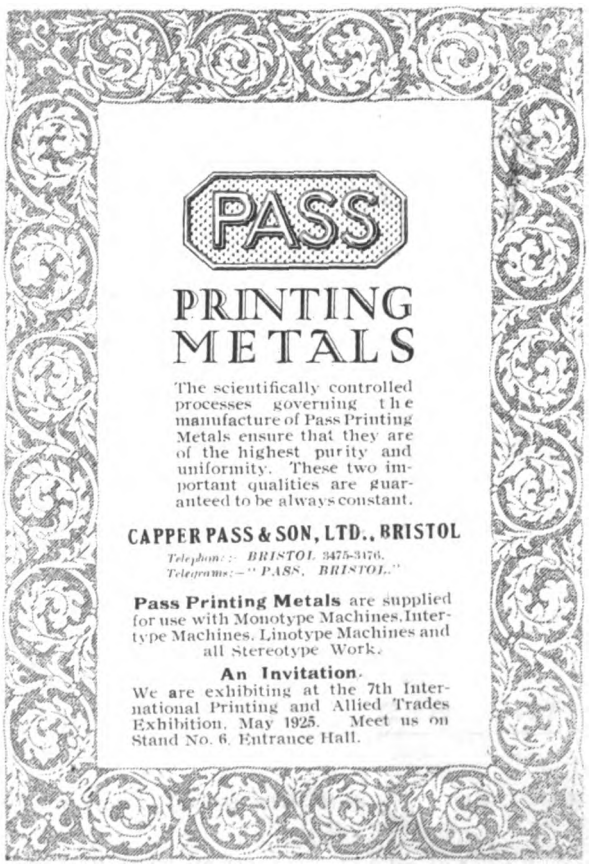
The report stated that the work of the Committee during the past year had once again had a considerable measure of success. "The annual dinner was held on October 18th at the Holborn Restaurant. The chair was occupied by Lady Newnes, who made an eloquent appeal and by her practical interest contributed largely to the success of that appeal. The subscriptions totalled £650, of which members contributed £136 17s. 6d., and to all the subscribers the committee tender their heartiest thanks. It has been possible to complete the formation of two pensions. No 17 has been named the 'H. M. Gurr Pension,' a well deserved tribute to the devoted service for so many years of the late secretary. Lady Newnes has, in addition to becoming a vice-president, consented to the association of her name with No 18. Col. E. Frederick Lawson, D.S.O., M.C, has consented to preside at the annual dinner, to be held at the Holborn Restaurant on Saturday, October 17th.

The financial statement showed that £642 had been added to the funds placed by the committee in the hands of the Printers' Pension Corporation on Pension account, the total sum to the credit of the committee now being £8,104 13s. 7d.

The report and balance sheet were unanimously approved, and the following officers were re-elected:—President, Viscount Burnham, C.H.; chairman, Mr. W. A. Perkins; trustees, Messrs. J. Chandler and J. Randall; treasurer, Mr. A. C. Sealey; hon. secs., Messrs. P. J. Greene and Robert Harris; executive committee, Messrs. J. H. Bedford (who acts as hon. collector), E. Alford, A. C. Cook, C. Curley, H. C. Golding, E. A. Groves, J. A. Moore, H. S. Temple and C. J. Tyrer; auditors, Messrs. W. F. France and E. Wiggins.

It was agreed that the chairman should be authorised to sign in favour of the alterations of bye-laws proposed by the Council of the Printers' Pension Corporation.

Edwards Dunlop & Co., Ltd.



The election of Mr. James M. Dunlop, chairman and managing director of Messrs. Edwards Dunlop and Co., Ltd., as president of the Sydney Chamber of Commerce was made the occasion for the presentation to him of his portrait in oils. The presentation was from the staff at the head office in Sydney and its branches in Melbourne and Brisbane.

Mr. C. T. Clarke presided over the gathering of directors and employees, and the presentation was made by Mr. B. D. Goodwin, one of the directors in Sydney, who referred to the affection and esteem in which Mr. Dunlop was held, to his business qualities and his great ability and loveableness of character. Mr. Goodwin pointed out that it was no small thing for any man to be able to inspire affectionate regard in the hearts of his fellowmen over whom in the ordinary course of his business he must be called upon to exercise authority. He trusted Mr. Dunlop might be long spared to work in the interests of the company.

Mr. William P. Dunlop, who by-the-way has been elected treasurer of the Sydney Rotary Club, also took a prominent part in the function. The portrait which was executed by Mr. Norman Carter, a foremost Australian artist, is an excellent likeness, and has now been hung in the board room of the company

---

THE number of persons on March 2nd, 1925 on the registers of employment exchanges in Great Britain was 1,237,700—1,635 more than a week before, 102,958 more than a year ago.

News-Print Competition.

Lord Rothermere and Anglo-Newfoundland's Handicaps.

An interesting side-light on the manufacture of news-print in Newfoundland was thrown by Lord Rothermere recently, when presiding over the annual meeting of the shareholders of the Anglo-Newfoundland Development Co., Ltd., in London.

After mentioning that the extension to the mill was now nearly completed, and that the new paper machine was expected to be in operation by April, his Lordship mentioned that the profits of the company were at present entirely derived from three contracts entered into with the Associated Newspapers, Ltd., the *Daily Mirror* Newspapers, Ltd., and the Associated Scottish Newspapers, Ltd. At the expiration of these contracts—which have another five years to run—the company would have to sell its products on the open market. The future market for the greater part of the company's product, he indicated, would undoubtedly be the United States, which consumes more news-print than all the other countries of the world put together.

Unexpected Fall in Price.

The history of the company in the past two or three years, except for the contracts mentioned, would have been very disappointing. There had been a steady, and quite unexpected, fall in the price of paper, and at the present time Scandinavian news-print was being offered in London at £16 10s. per ton.

Although a considerable reduction had been effected in the cost of manufacturing news-print at Grand Falls, it was not in any way equivalent to the fall in the market price of paper that had taken place. Less than two years ago, when the directors decided to proceed with the installation of a further paper-making machine, not only was the price of paper much higher than it was that day, but the indications pointed, in their opinion, to a rise in the price rather than to the fall which had taken place. Despite very efficient management at the mill and the use of up-to-date machinery and methods of manufacture, the mills of the company in Newfoundland were to-day unable to make paper and deliver it to the market as cheaply as Canadian mills.

Lord Rothermere went on to refer to two very severe handicaps with which the company were faced in producing paper in competition with Canada. In Newfoundland there were heavy import duties on many materials and machine supplies used in paper-making. These duties were estimated to amount to nearly two dollars per ton of paper. He hoped that the Newfoundland Government might direct its attention to this matter, as these duties were certainly prejudicial to the papermaking industry in Newfoundland.

Transport Handicap.

The second handicap related to the transportation difficulty. In practically four months of the year, from January to May, it was impossible to make shipments of paper from their port in Newfoundland to American or British markets, or when possible at all during that period, in only very limited quantities at a prohibitive freight cost. They had always thought that in some way or another shipments could be maintained for nearly the whole of the year, but experience had shown that this was not possible.

Much effort had been expended with this end in view. Last year a special steamer, the ss. Geraldine Mary, designed to cope with ice conditions, was launched. This steamer had so far fulfilled their anticipations in regard to lengthening by a few weeks the navigation period at the company's port. But, despite such efforts, there was still a matter of some four months when shipments were impossible.

In the case of a Canadian mill the paper was rolled on to railway cars and sent away daily. In Newfoundland the interruption to navigation not only meant the storage of several months' production of paper in Newfoundland, but it meant a similar storage at the point of delivery in order to maintain regular daily or weekly deliveries to its customers.

Altogether these handicaps, inclusive of the duties, represent, in Lord Rothermere's opinion, from eight to ten dollars per ton on the cost as compared with a Canadian mill. A mill in Canada, selling its product at the price which it cost them merely to make and deliver it, would be making a handsome profit and a good return on its capital, but, of course, many mills in Canada could make more than $10 per ton profit.

News-Print Rivals.

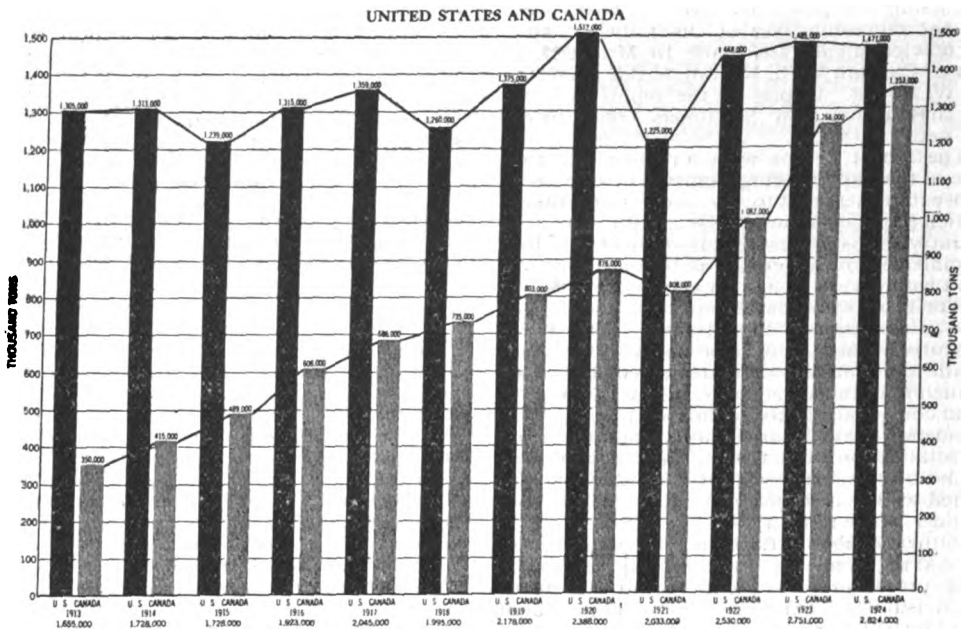
Canada Steadily Overtaking the United States.

A new continental record of 2,900,000 tons of news-print paper production was made in North America in 1924, with Canada as the determining factor in the increase over the previous year. The United States mills made 1,471,000 tons of news-print in 1924, a decrease of 14,000 tons from 1923 and of 40,000 tons from the high mark of 1920. Canadian news-print production amounted to 1,353,000 tons, an increase of 87,000 tons from 1923 and 54 per cent. more than in 1920.

The one modern news-print mill in Mexico made a little over 11,000 tons, and a similar mill in Newfoundland contributed 65,000 tons to the continental total, which exceeded 60 per cent. of the world production of this essential commodity.

With the production of news-print paper in Canada only nine per cent. behind that in the United States in 1924, admirers of the Dominion anticipate that the rapidly rising curve of Canadian tonnage will soon cross the stationary line of United States news-print manufacture.

The United States still holds its place as by far the greatest paper consuming nation the world has ever seen. With only a few thousand tons of domestic news-print exported in 1924, the publishers in the United States used nearly nine-tenths of the Canadian production, in addition to 156,000 tons imported from Europe. The consumption was 50,000 tons in excess of the record-making total of 1923 and 28 per cent. more than in 1920, the latter in its turn being a record to that date. On a per capita basis, news-print consumption in the United States has grown from four pounds in 1860 to sixteen pounds in 1900 and to fifty pounds in 1923 and 1924.



The recognised directory of the trade lists more than 22,000 newspapers in North America at this time, with an increase of nearly 200 in number during the past year. About ten per cent. of the total listings are daily newspapers, and the English language dailies in the United States have circulations amounting to 33,000,000 copies of the daily issues and of more than 22,000,000 copies of the Sunday issues. During the past five years the dailies have increased twenty-five per cent. in circulation and the Sunday newspapers forty-two per cent. Upon examination of the United States newspapers which have circulations in excess of 100,000 copies each, we find that the daily issues averaged twenty-eight pages in 1924 and the Sunday issues 103 pages, contrasted with twenty-three and seventy nine pages respectively in 1920. The most marked characteristic of the metropolitan newspaper to date has been its steady increase in size and circulation. There is now a copy of a daily newspaper published for every three and one-half inhabitants in the United States, or more than one for every family, which shows the far-reaching daily newspaper habit.

The total volume of newspaper advertising in 1924 was practically the same as in 1923 and in 1920. Periodical advertising, while three per cent. more in space filled in 1924 than in 1923, was still fifteen per cent. below the high mark of 1920.

News-print paper production in North America has increased at an average rate of nearly seven per cent. compounded annually for the past twenty-five years. The new mills and additions to existing mills now under construction or planned for will bring the capacity of the North American industry up to 12,000 tons daily in 1926, unless some mills should find it more profitable to change to other types of operation.

NEWS PRINT PRODUCTION 1913-1924

UNITED STATES AND CANADA

* Abstract of report made by R. S Kellogg, Secretary, at the annual meeting of the News-Print Service Bureau in Montreal, January 30th, 1925.

The Scottish Paper Trade.

Mr. W. A. Dewsnap (Messrs. Davies and Royle) recently returned from a short visit to Scotland, during which he surveyed the paper market in that area. He found the paper trade fairly active and moving steadily, if slowly, forward. This progress was rather preferred to any suggestion of a boom, which would create instability in trading conditions.

Prices were found to be firm, with a tendency to rise. No complaint was made, however, either in regard to quotations or the demand which prevails for papers generally, although, of course, a growth in demand will be appreciated.

In regard to kraft paper requisitions are rather for the cheaper grade of material.

A general feeling of gratification prevails in Scottish trade circles over the recent formation of the British Association of Colonial and Foreign Paper Mill Agents. It is felt that the Association is going to be of real service in paper trade organisation. Efforts are being made to get the outstanding agents in Scotland to become members of the Association.

Mr. Dewsnap visited the offices of Messrs. Costa and Cuthill, in York-place, Edinburgh, and was very much impressed by the complete equipment to be found here. An old mansion has been transformed into handsome and commodious headquarters for the company, and the furnishing is complete in every detail. Among the modern devices introduced is the dictograph telephone system, which connects all departments, and which, by the way, is to be installed in the London offices of Davies and Royle at Old Swan-lane.

Canadian Paper Company's Affairs.

According to a Vancouver message, the Montreal Trust Co., trustee for the bondholders of the Whalen Pulp Paper Co., have made an application to the Court for the judicial sale of the assets of the company, which are valued at $7,829,000, against liabilities of $10,153,000. The Whalen Co. is one of the largest debtors of the defunct Home Bank of Canada, it is added.

British Papermaking Technology.

Important Report by a Board of Education Inspector.

There was recently issued by the Board of Education a very comprehensive and useful report on technological education in England for the papermaking industry. The report was prepared for the information of the Board by one of H.M. inspectors, and it is correctly thought that it might be of interest and use to those engaged in the industry as well as to those who are concerned with the development of technical education in papermaking. The writer of the report had opportunities of discussing the problems involved with prominent representatives of the industry, and acknowledgments are made to Mr. Arthur Baker, Captain W. E. Nuttall, M.B.E., and Mr. A. W. Foster. Copies of the report may be purchased from H.M. Stationery Office, price 6d. net.

The report begins with a reference to the size of the papermaking industry in comparison with others and to the great importance which paper occupies in the activities of the country. It is pointed out that without paper commerce, education and public administration would soon come to a standstill.

The history and development of the industry in England is then traced. The main features of the later developments of the paper trade are summarised under three headings, which refer to the increasing use of machinery and continual improvements in the plant, a tendency towards larger mills and increased specialisation, and the gradual recognition, especially since the war, of the aid which applied science first and chemistry second would render to the industry.

Other sections of the report deal with educational requirements of the industry, the existing provision for education and a general criticism of the existing educational provision and instruction in papermaking for the wholesale paper trade, the wholesale stationer, the printer, etc.

The report closes with the following summary of the chief recommendations:—

(a) There should be in this country one or possibly two centres for the most advanced instruction and research in papermaking. These centres should be:—(1) Manchester, for the Lancashire, Yorkshire, Derbyshire and Cheshire area; and perhaps (2) London, for Kent and the Home Counties.

(b) It is desirable that as far as circumstances permit, those desirous of occupying the higher posts in the industry, especially in the larger mills, should have three or four years' full time training at a technical college or institution of university rank.

(c) Part time courses.

(i.) As far as is practicable, the existing single classes in papermaking should be replaced by grouped courses in chemistry, engineering and papermaking.

(ii.) All boys entering the mills at or about 14 to 16 should be encouraged to attend preliminary courses in English, mathematics, drawing and elementary science in an evening continuation school for two years. Preferably, where practicable, "time off" might be allowed, for, say, two half days per week, for juvenile employees to attend similar courses in the day time.

(iii.) After attending an evening continuation school, suitable grouped courses in engineering and/or chemistry and papermaking should be attended in a local technical school, if possible, for three or more years, the exact nature of the course depending upon the special section of the mill in which the student is employed.

(iv.) For adults with insufficient preliminary education, or for students unwilling to undertake the lengthy courses referred to in (iii.) above, modified courses are suggested.

(v.) The establishment of classes in papermaking in certain districts, *e.g.*, Yorkshire, Lancashire (Darwen or Blackburn), Hertfordshire, Buckinghamshire, where no instruction is now provided and where a fair number of students might reasonably be expected. These classes might perhaps in some cases be intermittent, *i.e.*, held say for one or two sessions and then abandoned for three or four years.

(vi.) The establishment of advanced instruction (evening or part-time day classes) in papermaking, in a few centres, *e.g.*, Manchester, Dartford, with the provision of travelling facilities for qualified students from neighbouring districts to attend the classes.

(d) Scholarships.—If and when financial conditions permit, scholarships with maintenance grants should be provided enabling the most promising students in evening classes to attend full time day courses for two or three years at a technical college or other institution providing highly specialised instruction in paper technology.

(e) Certificates.—The establishment of a grouped course certificate, definitely recognised by the industry, testifying to training and attainments in engineering and chemistry as well as in papermaking.

(f) Local Advisory Committees.—Where possible, local advisory committees, with representatives of the trade, including workpeople, should be formed in connection with each centre providing instruction in papermaking and allied subjects.

(g) Reference Libraries.—The formation of reference and lending libraries containing the standard books and trade journals connected with the industry, in mills situated in those districts where the students are not within reasonable reach of a public library.

Papermaking in Tasmania.

Progress of the New Project.

Definite progress is being made with the project to establish a paper mill in Tasmania, and the Tasmanian Parliament has passed legislation on the subject.

This new measure is described as a Bill to encourage the manufacture in the State of wood pulp and paper and to authorise the granting of certain rights and concessions to the Amalgamated Zinc (De Bavay's). It sets out that the company proposes to form a company, having as one of its objects the erection of a factory and works upon lands in the vicinity of Burnie for the manufacture of wood pulp and paper. The measure is to be administered by the Hydro-Electric Department of the State. Water rights from certain rivers can be granted to the company by the Minister of Mines and a lease of a strip or strips of land not exceeding a chain in width across the foreshore of Emu Bay, and opposite the lands on which the industry will be conducted, may be granted to the company.

The company is to have the right to take timber for 15 miles on either side of the west coast line, and pay 1s. a cord for pulping wood and ordinary rates for milling timber, no exemption being made as to any kind of timber. Where the net profits amount to above 8 per cent. per annum the royalty can be increased by £5 per cent. for every £1 or fraction of £1 per cent. by which the profits exceed 8 per cent., but the royalty is not in any case to exceed 2s. 6d. a cord of 128 cubic feet of timber.

The company will have rights over an area 70 miles by 30 miles, of which it already holds 17 miles in length. It is stated that the capital involved in the venture will be £500,000.

At the half-yearly meeting of the shareholders held in Melbourne on November 21st last, Mr. W. L. Baillieu referred to investigations regarding the possibilities of establishing a paper pulp and news-print industry, and said that the magnitude of the project meant that much effort had to be expended before the prospects could be gauged with such certainty as to justify the board in making a definite recommendation to shareholders. The directors, he said, had good warrant for regarding the advantages, which it was not politic to specify, assured to them, which would do much to facilitate the finances and make the proposal more attractive than the ordinary onlooker was able to appreciate.

We understand that two representatives of the company are at present in this country engaged upon a series of tests on a commercial scale with timber sent from the other end.

DEVON VALLEY PRIMROSES.—Once more there comes to hand a delightful reminder of the approach of spring in a bunch of Devon Valley primroses, sent with the compliments of Wiggins, Teape and Co. (1919), Ltd., from their Devon Valley Mill, Hele. Accompanying the gift is a little vellum slip bearing a sketch of a Devonshire farmer, with the caption: "Thur be tu guid Demshur things beginning with a p. Yurs one of em. Us makes tother. 1925."

Drying Boards.

Some useful observations on the process of drying boards are given by Mr. D. Manson Sutherland, Jun., in the course of an article in the *Paper Trade Journal* (N.Y.). The problem of drying boards flat and quickly has engaged the attention of the board industry for many decades, and although progress has been made, the best solution remains to be found.

The earliest types consisted of circulating warm air into a chamber in which the boards were hung or placed in racks or trucks. The length of time required for complete drying depended on thickness of the sheets and volume and temperature of the air circulated, but buckling was unavoidable.

Various methods of heating and circulating on through the tunnel or compartment have been used, and improvements in efficiency have been obtained, but buckling has continued to be troublesome and a serious loss.

Vacuum dryers have been used for drying boards ranging from 0·187 and upward, but even the low temperature that is possible by this process does not overcome buckling.

Continuous driers in which the boards are passed between a series of rolls in a chamber heated with steam coils and hot air circulation give good results as far as buckling is concerned, but the cost of this apparatus is high and consequently not available to the average board mill.

Systems using breathing heated plates have been tried with some degree of success, but a perfectly flat board is difficult to produce.

Case Hardening of Surfaces.

In drying problems considerable stress has been given to case hardening of the surfaces, and many claims have been made that apparatus now available eliminates this difficulty, but such result can only be obtained by reducing temperature and thus lengthening the drying period. Practically all machines on the market seek to remove the moisture as soon as it evaporates from the board, although some claim to retard this in some manner until the drying is partially completed, but again this can only increase the drying time.

A method of drying sheets of pulp by means of superheated steam in direct contact with them demonstrated that temperature as high as 700 degs. F. could be used without injury to the fibres, providing air, *i.e.*, oxygen, was excluded. High temperatures containing moisture seemed to have no harmful effect and dried sheets in a few minutes, where hours are ordinarily required, but the cost of the apparatus and need for skilled operation has so far prevented commercial application.

Obviously the higher the temperature used in drying the quicker the operation will be, but the difficulty of preventing case hardening and overcoming other obstacles mentioned have appeared to be insurmountable.

New Process Recently Patented.

After many years of study, experiments and practical working, a new process has recently been patented which gives promise of revolutionising methods of drying boards.

This process consists of applying steam heat at 100 lb. pressure or less by means of cast iron plates on each surface of the board, giving a maximum temperature on the surface of the plates of approximately 290 degs. F.

The moisture is removed by enabling it to pass between the interstices of a fine wire mesh, which is placed in between the board and the steam heated plates. The temperature in the plate insures uniform evaporation over the entire surface and the edges dry after the centre because the moisture must pass over the edges to escape, thus the effect is the direct opposite to existing types.

Furthermore the plates are kept tightly against the board, so that a perfectly flat sheet is produced.

Board manufacturers will also realise that this process does not invoke the use of air fans or any operating mechanism, except when the machine is opened for the removal of dried boards and loading of wet sheets. A wire mesh as fine as 65 per square inch can be used, thus avoiding any surface marks which might be detrimental in some cases.

This type of dryer can be designed for travelling wires so as to easily load and unload large and heavy sheets without marring the surface, and can also be built vertically to economise on floor space.

This type of dryer will dry a sheet of 0·250 thickness made of mixed paper containing 50 per cent. moisture, in 30 minutes, and other thicknesses in proportion.

Paper in New Zealand.

United Kingdom's Share in a Growing Trade.

Some useful information concerning the New Zealand market for paper and stationery is contained in a report on the economic and commercial conditions in the Dominion to August, 1924. It is prepared by Mr. N. Elmslie, H.M. Trade Commissioner, and issued by the Department of Overseas Trade. (2s. 1d. from the Stationery Office).

Dealing with paper, the report says: The value of the imports was 50 per cent. greater in 1923 than in the previous year, and of this larger trade United Kingdom producers obtained 51·8 per cent., as compared with only 39 per cent. of the smaller 1922 trade. This satisfactory improvement is chiefly due to the great progress made in supply of printing paper, and to a minor extent to the increased share obtained of trade in paper hangings and writing paper. The total imports in this class, and the shares of some of the supplying countries, is shown in the following table:—

Country of Origin.	1922.	1923.
United Kingdom ...	£284,217	£568,123
Australia	7,949	16,139
Canada	338,864	343,441
United States ..	42,695	61,609
Other Countries ...	55,758	107,563
Total... ...	£729,483	£1,096,875

"Vegetable parchment" is being imported in increasing quantities for packing butter; imports in 1923 were 22,613 cwt., valued at £61,703, as compared with 8,511 cwt., valued at £24,597, in 1922. Belgium is the chief supplier, but Norway, Sweden, France and Italy all obtain a fair share of the trade. The United Kingdom supplied only 135 cwt., valued at £438. Imports of "Cardboard, millboard, corrugated board, etc.," were valued at £105,939, of which £24,218 was of United Kingdom origin; the United States were the largest suppliers, with the Netherlands and Australia also prominent. The share of this trade secured by the United Kingdom appears to be decreasing. Imports of "Paperhangings" increased from £62,636 in 1922 to £89,473 in 1923, of which £67,052 or 75 per cent., was of United Kingdom origin, a marked improvement on the 63·7 per cent. of the trade secured in 1922. Canada supplied most of the remaining trade.

"Printing paper" imports were 415,991 cwt., valued at £522,291, as compared with 317,958 cwt., valued at £385,236, in 1922. Of the total, 194,091 cwt., valued at £274,838, was of United Kingdom origin, and 219,487 cwt., valued at £242,536, was Canadian. In the 1923 accounts, for the first time, imports have been sub-divided into "News print" and "Printing paper, other"; the greater part of the Canadian paper comes under the first heading; of the "other" paper, 82 per cent. of the 166,393 cwt. imported was of United Kingdom origin.

In "Wrapping paper," of a total import of 45,174 cwt., valued at £81,348, the United Kingdom share was only 3,089 cwt., valued at £6,037; trade is being lost to Canada, who this year supplied over 75 per cent. of the whole.

Imports of "Writing paper" of all kinds were valued at £155,231, of which £140,375 was of United Kingdom origin. The percentage of the trade obtained—90 per cent.—is the highest yet attained since the import returns have been kept by "country of origin," probably in consequence of the preferential treatment accorded by the 1921 Tariff.

Stationery.

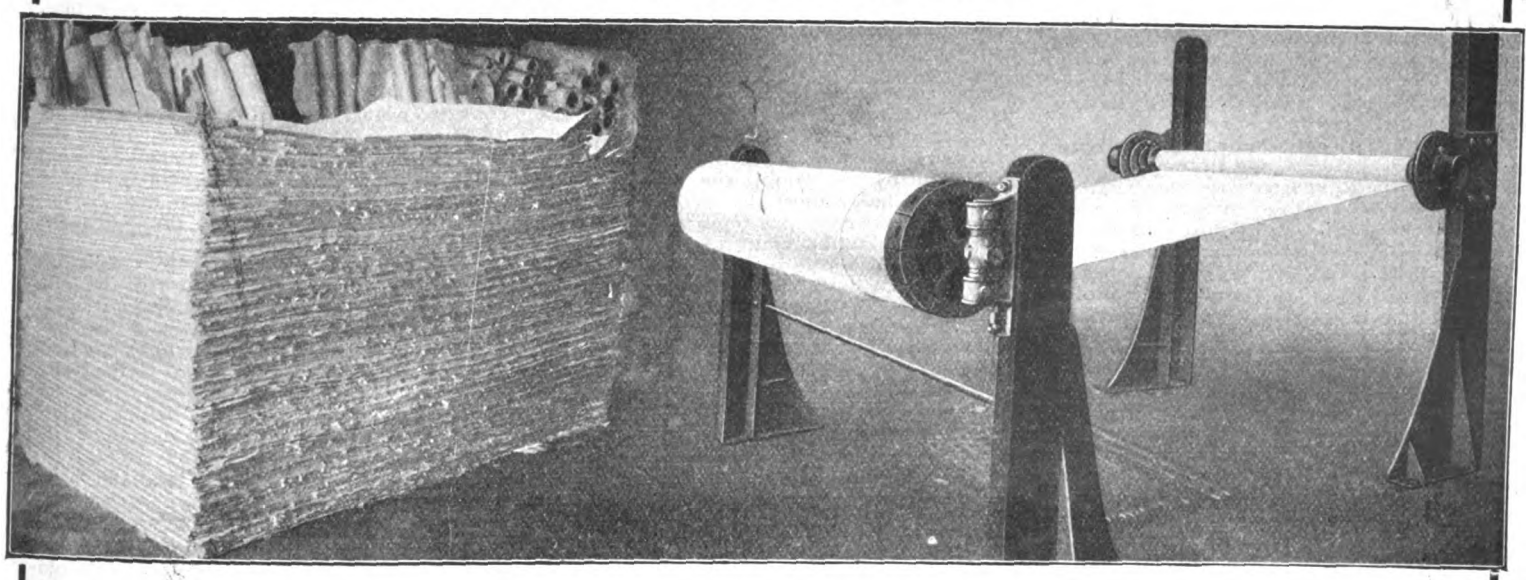
Imports of stationery and the shares of the more important supplying countries are shown below:—

Country of Origin.	1922.	1923.
United Kingdom ...	£499,616	£609,863
Australia	99,013	92,534
Canada	8,211	14,019
United States ...	87,239	107,000
Other Countries ...	8,411	10,636
Total... ...	£702,490	£834,052

The share of the trade in this class secured by United Kingdom producers increased from 71·1 per cent. in 1922 to 73·1 per cent. in 1923, and is now not far below the pre-war level.

"Books, papers and music, printed, n.e.i." is the most important heading in the class, and of imports valued at £473,939 United Kingdom producers supplied £366,992; the United States and Australia are still supplying a larger proportion of the trade than they did before the war. In "Calendars and show cards" goods of United Kingdom origin were valued at £14,895, out of a total of £26,076. "Envelopes" imported are almost entirely of United Kingdom origin, less than 6 per cent. of the imports, valued at £33,732, being from other sources. In "Handbills, circulars, etc.," the United Kingdom does not show to advantage, only £4,240 out of a total of £23,581 being credited to her. The more energetic advertising methods of the United States and Australia are reflected in the import figures, which are £11,849 and £6,116 respectively.

In the general groups "Manufactured stationery" and "Stationery n.e.i.," the position is more satisfactory. Out of total imports valued at £96,970 and £106,341 in the two groups, United Kingdom producers supplied £74,350 and £76,271. In the first group, which is subject to the higher duty, the percentage of trade obtained—76½ per cent.—is higher than it was in 1914; in the second the recovery is not quite so good, and the United States still holds a larger share of the trade than formerly.



Test for Water Resistance.

In connection with development of specifications for papers made waterproof with asphaltum, additional work has been completed by the Bureau of Standards, Washington, regarding the test for water resistance. A modification of this method was evolved, however, which gives good results. It consists in folding the paper box-shape, filling with water and placing on the surface of a piece of ground glass. Any moisture penetrating the paper appears on the surface of the ground glass and makes it transparent. Some waterproofed papers which showed transudation of water in a few minutes by this method, remained standing indefinitely under a water column without showing evidence of water penetration.

THE cost of living is not a thing in itself but consists of the compensation of all the people who do anything for us.

LOVE'S PAPER RECOVERY MACHINE.

Patented (No. 144485) by Joseph Love.

THIS Machine has been invented for the purpose of speedily recovering the small quantities of paper left on centres or spools which are thrown out from Printing Machines, etc. (commonly known as "Reel Ends"), so that it may be cut into suitable sizes by the Guillotine.

CHIEF ADVANTAGES:

1.—No spindles, bars, or cones are required, the reels being kept in position by a patent spring device thus saving time and labour in loading and unloading.
2.—It occupies a space of only six feet on the run, and is quite noiseless.
3.—The power required is such a small amount that it can be driven from any existing shafting
4.—Centres of any kind or width can be worked on the machine.
5.—It can be run at the high speed of 500 feet per minute, and will recover approximately 3 tons of paper per day.
6.—It can be constructed to suit all requirements in the off-cut trade, and is equally valuable to Printers or in Paper Mills.

Pulp and Paper Census.

Official Statistics Concerning the Canadian Industry.

There has recently been published by the authority of the Canadian Minister of Trade and Commerce, the Hon. Thomas A. Low, M.P., the results of the census of production taken of the Canadian pulp and paper industry in 1923. The contents of the booklet, which runs to 81 pages, have been prepared by the Dominion Bureau of Statistics, Forest Products Branch, the statistics being collected and compiled during 1924 for the calendar year 1923. The information has already been published in part in the form of separate preliminary reports, but the complete information is now presented in one volume, and is printed both in English and French.

Some history and a description of the processes of pulp and paper manufacture are given in a foreword. From this we learn that the first paper mill in Canada was established at St. Andrews in Quebec in 1803, while in 1825, at Crook's Hollow, was erected the first paper mill in what was then Upper Canada. What is claimed to be the first wood pulp mill in the Dominion was erected by Angus Logan and Co. at Windsor Mills, Quebec, about 1870. The Riordons were among the first to manufacture ground wood pulp, and in 1887 Charles Riordon installed the first sulphite mill at Merritton, Ontario. In the census of 1871 pulp mills are not mentioned, but in 1881 five mills were reported with a total capital of $92,000, 68 employees, and an output valued at $63,300. In 1891 there were 24 pulp mills, and at the present time there are 43, together with 32 combined pulp and paper mills and 35 mills equipped for manufacturing paper only.

The statistics which follow very clearly demonstrate that the pulp and paper industry in Canada has increased steadily in importance since its first inception in 1803. If the total net value of production for the entire industry be considered as the sum of the value of pulp wood exported, pulp exported and paper products manufactured, then the maximum was reached in 1920 with a total of $224,414,131. There was a decrease in 1921 followed by increases in 1922 and 1923, when the total was $188,642,109.

A table of total gross production shows that in the case of paper the increase was from 1,214,951 tons in 1920 to 1,589,303 tons in 1923; in the case of pulp, production was 1,960,102 tons in 1920, and by 1923 it had risen to 2,475,904 tons. Total production of pulp wood in 1920 was 4,024,826 cords, and after a relapse in the following year the figure rose to 4,654,663 tons in 1923. With regard to values, the total for the three classes of material in 1920 was $334,987,904, and in 1923 it was $294,282,408, smaller figures having occurred in 1921 and 1922.

Coming to total net production, the figure in 1920 was $224,414,131, and in 1923 $188,642,100. Pulp wood exported rose from 1,247,404 cords in 1920 to 1,384,230 in 1923. Pulp exported was 819,985 tons in 1920 and 875,358 tons in 1923. Paper production figures are as follows: 1920, 1,214,951 tons; 1921, 1,018,947; 1922, 1,366,815; 1923, 1,589 303.

Plants Reporting.

The report goes on to show that there were 110 mills reporting in 1923, as compared to 104 in 1922. Forty three of these were pulp mills, 32 combined pulp and paper mills and 35 were mills making paper only. There were a number of changes during the year. Four new pulp mills started operating, three in Ontario and one in Quebec. One new pulp and paper mill started operating in Quebec, and two paper mills in British Columbia. One paper mill in Ontario resumed operations after being idle in 1922. One pulp mill in New Brunswick and two in Ontario began to manufacture paper as well as pulp. Only two mills which operated in 1922 were idle in 1923, one a pulp mill in Nova Scotia and the other a paper mill in Quebec.

All the principal statistics, including those relating to capital, employment, operating expenses, raw materials and products, show increases from 1922 to 1923, and these increases are fairly general throughout the provinces, with the exception of Nova Scotia, where decreases are due to the fact that one mill less was in operation.

A table reviewing the pulp production from 1908 to 1923 shows an increase in the output of mechanical pulp from 278,570 tons in the first year to 1,419,547 tons in 1923. The figures for chemical fibre are 84,500 tons in 1908 and 1,012,092 in 1923. Values are only given from 1917, and it is shown that in the case of mechanical the increase since that year is from $25 918,811 to $37,587,379 and in the case of chemical fibre from $38,374,191 to $60,674,518.

Groundwood pulp formed 57·3 per cent. of the total production in Canada, making up almost half the total in British Columbia and over half in Ontario and Quebec. Of the chemical fibre, unbleached sulphite was the most important, forming about a quarter of the total for the Dominion and from a fifth to a third in each province. Sulphate or kraft fibre formed 9·1 per cent. of the total, being fairly important in Quebec and New Brunswick and less important in Ontario and British Columbia. Bleached sulphite made up 7·7 per cent. of the Dominion total and was the most important pulp made in New Brunswick, where it formed 44·6 per cent. of the total. It was also important in British Columbia and Ontario. Soda fibre is made only in Quebec.

Ontario and Quebec are the principal provinces concerned with the production of pulp, Ontario being responsible for 35·4 per cent. of the total output and Quebec for 50·2 per cent., British Columbia with 8·8 per cent., New Brunswick 4·5 per cent., and Nova Scotia 1·1 per cent.

Over half the pulp production in Canada is made in combined pulp and paper mills for their own use in papermaking. One third is made for export and the remainder is sold to paper mills in Canada. Almost three-quarters of the groundwood is made for own use and almost a quarter for export, less than 3 per cent. being made for sale in Canada. All the soda pulp is made for own use. In the case of unbleached sulphite over half is made for own use and over 40 per cent. for export. Over 60 per cent. of the bleached sulphite is made for sale in Canada and a third for export. The sulphate or kraft pulp is made for export to the extent of 72 per cent. and for own use to the extent of over 20 per cent.

Paper Production.

Production of paper in Canada since 1917 is reviewed and a concise table sets out the exact figures. News-print production increased from 689,847 tons ($38,868,084) in 1917 to 1,251,541 tons ($93,213,340) in 1923. The increase for book and writing paper is from 48,141 tons ($9,310,138) in 1917 to 76,789 tons ($13,582,195) in 1923; other wrapping paper 50,360 tons ($5,646,750) in 1917 to 84,912 tons ($7,666,174) in 1923; boards 54,080 tons in 1917 ($3,543,164) and 130,582 tons ($8,480,233) in 1923. Production of other specified paper products rose from 11,261 tons ($1,382,205) in 1917 to 45,470 tons ($5,042,488) in 1923. The corresponding figures for total paper production are: 1917, 853,689 tons ($58,855,258); 1923, 1,589,303 tons ($127,984,370).

With a few exceptions there was a steady annual increase in paper production of all classes from 1917 to 1920. A general decrease in all classes took place in 1921, but was followed by substantial increases in 1922 and 1923. During the period the production of news print has almost doubled, the production of paperboard has more than doubled and the production of miscellaneous papers has increased fourfold. The increases with book, writing and wrapping papers during the period have been from 60 to 70 per cent. and the increase for all classes has been over 80 per cent.

News print paper has formed about 80 per cent. of the total production of paper in Canada since annual paper statistics were first collected. It forms over three quarters of the total paper production in all four paper-making provinces. Paper boards are next in importance, contributing over 8 per cent. of the total for Canada. This product forms over 13 per cent. of the total in Ontario. Wrapping paper forms over 5 per cent. of the total for Canada and comes second on the list for Quebec and New Brunswick. Book and writing papers form only 4·8 per cent. of the tonnage production, but come second on the list for value production on account of their high average value per ton.

While Quebec leads in pulp production, Ontario heads the list in the manufacture of paper, furnishing over 45 per cent. of the total. Ontario leads in the production of book and writing paper and paperboards and also produces a large proportion of the news-print. Quebec and New Brunswick together lead in news print, wrapping and miscellaneous paper production.

Increases in production were general with all classes of paper throughout the four paper producing provinces, except that in Quebec and New Brunswick a slight decrease in wrapping paper was reported. The greatest proportionate increase was reported for book and writing papers, with other substantial increases for news-print and boards, the greatest increase in actual quantity being, of course, with news-print. In Quebec and New Brunswick the production of all classes of paper, except wrapping paper, is increasing more rapidly than in Ontario.

Mr. Frank W. Clarke.

Visit of President of the Canadian Pulp and Paper Association.

An interesting visitor to this country is Mr. Frank W. Clarke, the recently elected president of the Canadian Pulp and Paper Association. We believe this is the first time that a president of the Association has ever paid a

Photo. Notman, Montreal.

MR. FRANK W. CLARKE.

visit to the United Kingdom while holding office. Mr. Clarke is one of the most progressive men in the pulp and paper industry of the Dominion and is the youngest president that the Canadian Association has ever had.

It is understood that Mr. Clarke is here to consult with Lord Rothermere and his associates on the business connected with the newly incorporated Anglo Canadian Pulp and Paper Co., Ltd., which is shortly to build a large news-print mill near the city of Quebec, Mr. Clarke being the Canadian executive of the company.

A resident of Quebec City, Mr. Clarke has for many years been connected with the pulp and paper industry and has had experience in all its branches. He is president of the Gulf Pulp and Paper Co, with which he has been connected for over 17 years, and of the North Shipping Co. He is also a director and one of the founders of the Clarke Trading Co. and the Clarke Steamship Co., a director of the Labrador Fisheries, Ltd., the Anglo-Newfoundland Development Co. and the South Shipping Co.

PAUL SABEL AND CO., LTD. — Interesting changes have recently taken place in the old-established firm of Paul Sabel and Co., Ltd., 26, Upper Thames street. It may be recalled that they were the first to import foreign paper when duties were abolished many years ago. The present firm represent some of the most important mills on the Continent, making all classes of paper, and their export trade is always increasing to every part of the world through these various agencies. Mr. Victor A. Moss and Mr. Leslie H. Sherrard, who as young men have been associated with the firm for some years, have become directors and will help very closely in the general conduct of the business, in conjunction with the present directors, Mr. P. P. Sabel and Mr. H. J. Sherrard. With this help on the directorate the business, which has developed considerably of recent years, will do so more than ever.

STANDARDISING MACHINERY

USED IN

The Paper Consuming Industries.

Specialisation Urged on the Part of Manufacturers.

The book mentioned in the footnote is dedicated by its author to the memory of his father, who was an advocate of standardisation in advance of his time. The principal contents were first presented as a dissertation to the Technical High School of Berlin, and are now reproduced, with editorial alterations and additions, at the request of many interested persons.

The author is a grandson of Karl Krause, and now head of that famous Leipzig firm of builders of machines used in the industries utilising paper as their raw material. The example cited and the opinions expressed are naturally drawn from his life-long experience in that business, and, indeed, the work forms a fairly comprehensive catalogue of the Krause products. It is none the less valuable as a contribution to the problem of the standardisation of machinery, and the author has made liberal use of the work of other German authorities in this field.

The author arranges standardisation in three divisions, viz., (1) Normung, (2) Typung and (3) Specialisierung, which we may state as:—

(1) Standardisation of the basic elements,
(2) Classification of the completed structure,
(3) Specialisation in manufacture, or division of work.

His remarks do not deal with the paper-making machine, for he uses the words "paper machines" in its widest sense, embracing every machine which makes or treats paper in any form whatever. Tables which are given clearly show how wide are the ramifications and how diverse the types, but he insists strongly upon the need for an agreement amongst makers as to limiting the forms of the complete machine so as to include the absolute necessities only and to types which are proved to be generally applicable.

He points out that in the graphic industries there is already a considerable amount of standardisation. The compositor's case, type founts, etc., have long been made to fixed standards generally accepted. But standardisation of paper sizes is of decisive importance, and is only now beginning to gain ground, since wearisome discussions have overcome many obstacles. The committee of the German graphic trades and the committee of Germany industry have adopted the "din" sizes (Deutsche Industrie-Normen) which are arranged in four categories, of which category A is preferably used. A tabulated statement of this system is contained in the appendix.

The author's ideal is an industry so organised that each firm would make only one type of machine, or where the demand would not justify such a close specialisation, only a limited number of types, and that within its sphere each firm would make a standardised machine not only in its general form, but in all details, and that such details where used by other makers would conform to the same standards.

Such an arrangement would conduce to increased production and result in a cheaper product.

The Association of German Envelope Machine Makers, has already attained a pretty thorough organisation on these lines; each firm makes only one or two types of machine, and the buyers (envelope makers) send their orders through the Association so that the various makers receive only large orders for machines. Each maker is allotted a definite proportion of the entire turnover of the industry, and where in any year a maker's share falls short he is compensated by the Association.

He would standardise also such details as the business getting literature, cost estimates, quotations, etc., and examples are given. But he recognises the necessity for a certain amount of flexibility, and in particular would give complete liberty of manufacture to the inventors of new and patented devices.

The author gives the most practical proof of his faith in that his own firm has now specialised without coming to any agreement with other makers. It has cut out the production of several machines which it formerly made, such as calenders, calender bowls, length, cross and angle cutters and hydraulic presses. By simplifying the types of the other machines the 940 models which were made in 1914 were reduced to 392 in 1921. These are divided into three lists A, B and C, of which those in A are in greatest demand, and a comparison of this with the 1914 catalogue shows a reduction of models equal to 78 per cent. This concentration has enabled them to effect further economies by producing new properly standardised designs adaptable to many purposes.

The problem bristles with difficulties, but in this well printed book it is set forth clearly and in much detail. It is a comprehensive presentation of the case for standardisation, classification and specialisation in the machine building industry, applicable to other countries although written specially with the object of rendering German industry still more efficient.

Origin of Playing Cards.

Mr. Edward Cunningham, of Messrs. Chas. Goodall and Son, who has devoted years to the study of playing-card history, has put forward an ingenious theory as to their origin, briefly as follows: The ancestors of cards, he says, were a kind of chessmen, which, for the sake of portability or cheapness, were painted on disks, usually of ivory. The game of chess originally, as now, represented two armies in conflict *in the open*, the movements of each army being wholly visible to the other. Once flat chessmen were evolved, however, the use of *concealed* armies became possible. The resemblance to cards of chess played in this manner is obvious, and no development of the game would be more natural than dispensing with the chequered board and using the card-chessmen for a game of chance as a relaxation from the game of skill for which they were primarily intended.—*Morning Post.*

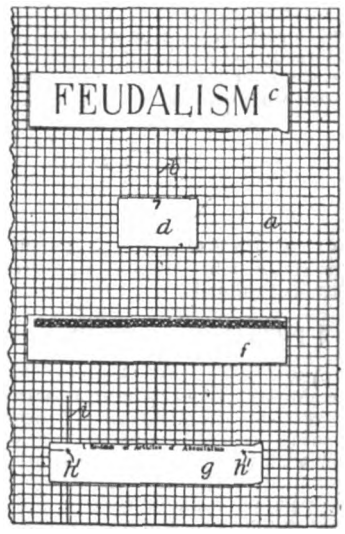
New Inventions

Damping and Inking, Etc.

In printing machines of the kind having inking or damping rollers mounted in forks or supports carried in pivoted sockets, and eccentric studs or elements for adjusting the sockets about their pivots, as patented by Mr. A. B. Evans, the eccentric studs are provided with lock nuts, etc., for clamping the sockets in adjusted position. The brackets on which the sockets are carried may be pivotally mounted upon the machine frame. The rollers *a*, contacting with the forme *d* and with a rider roller *h* in fixed bearings, are mounted in forks *b* carried in sockets *c* adjustably pivoted at c^1 to brackets *e* adjustably pivoted to the frame *f* of the machine. Screws b^1 and lock nuts b^2 permit the contact of the rollers *a* with the forme *d* to be adjusted. The

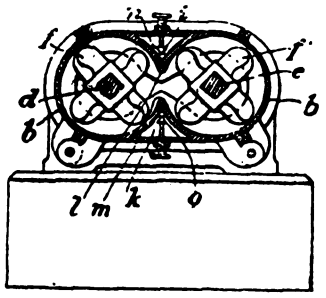


sockets *c* are adjustable about the pivots c^1 to vary the contact of the rollers *a* with the rider roller *h* by means of rotatable studs *g* screwed into holes in the brackets *e* and having eccentric portions g^1 engaging enlongated holes c^2 in the sockets *c*. The studs have squared ends g^2 for turning them, and are secured in adjusted position by lock nuts g^3. Mr. Evans has also patented an invention that relates to continuous or composite designs printed by offset cylinders *e* receiving the designs from plate cylinders *a*, *b*, fitted with detachable plates *c*, *d* for printing a half of the design. If desired more than two printing cylinders may be arranged to print smaller fractions of the design than a half

the printing cylinders being so arranged that a complete design is printed on the cylinder *e* The cylinder *e* may co operate with a further offset cylinder *f*, or direct with an impression cylinder as *h*, or two cylinders *e* may coact to print designs on opposite sides of the material.

Preparing Originals for Printing.

An invention by the Polygraphische Ges. relates to the process of preparing originals of type matter for the production of printing surfaces described in the parent specification, the correct portions of the first sheet and the strips bearing the corrector lines or groups of lines are stuck on to a support *a* provided with vertical and, preferably, also horizontal lines to facilitate the proper grouping of the parts with respect to strips bearing titles, page and chapter numbers, and borders. Preferably one of the vertical lines *b* is more pronounced than the others so that a symmetrical arrangement of the titles, numbers, and borders can be readily effected by first folding the strips such as *c*, *d*, *f* so that the ends of the printed matter upon them coincide, and then forming a central crease which is caused to coincide with the line *b* when the strips are stuck on to the support. The first portion such as *g* of the sheet bearing the ordinary type matter is similarly creased and applied and one or more lines *i* in alignment with the registering marks h^1 is marked on the support to form a guide in assembling the remaining portions. The lines on the support are preferably blue so that they will not be reproduced when the assembled original is photographed through

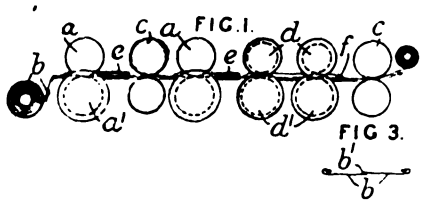


a yellow filter, and blank spaces for advertisements are preferably covered with plain paper prior to the taking of the photograph.

Paper Disintegrator.

In a patent for a paper shredder or disintegrator, the trough or well of the machine is provided with a heating device, as shown in the accompanying illustration.

The two shafts, d and e, are equipped in the usual manner with stirring or kneading paddles, f. While heretofore hot water only has been admitted with the paper to be disintegrated, the interspaces i k, between the two halves of the trough, are formed into



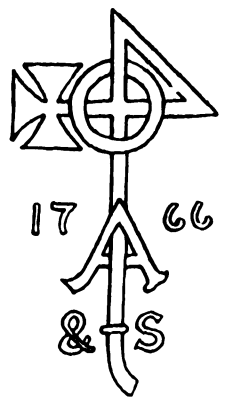
chambers, into which steam is admitted by which the trough is heated for its entire length. In order, however, to allow of the admission of steam or hot water to the paper stuff at any desired point in the length of the trough, the steam chambers i and k have, at I and m, apertures that can be closed, when desired, by means of the compression screw valves, n and o. The temperature in the machine can therefore be regulated within the widest ranges and the use of power thereby effectively reduced.

In place of the heating chambers, or in addition to them, heating pipe coils can be disposed in the trough, between the turns of which the beating paddles can work.

Reinforcing Paper Strips.

A device for producing reinforcing folds in a paper strip b for use as a bandage, etc., comprises flanged rollers a^1 co-operating

with plain rollers a, scrolls e for doubling down the edges of the strip, and grooved rollers d co-operating with ribbed rollers d^1 which in conjunction with a folding blade f produce a fold b^1 in the middle of the strip as shown in Fig. 3. Pairs of plain rollers c are employed for pressing the folds. A patent application in respect of this device has been made by Mr. B. B. Schwertzer.



New Trade Marks.

454,543. Musical publications. Percival Edward Mendham, 6, Green's End, Woolwich, London, S.E.18; merchant.—December 15th, 1924. (To be Associated. Section 24.)

Registration of this Trade Mark shall give no right to the exclusive use of the word "Everflat."

453,036. Gummed paper made wholly in Great Britain. Charles Morgan and Co., Ltd., 182 to 184, High Holborn, London, W.C.1; wholesale stationers.—October 24th, 1924. (To be Associated. Section 24.) (By consent)

Registration of this Trade Mark shall give no right to the exclusive use of the numerals "1766" or of the letters and abbreviation "A & S."

455,089. Paper (except paper hangings), stationery and bookbinding. Adlard and Son and West Newman, Ltd, 23, Bartholomew-close, London, E.C.1; printers and publishers.—January 6th, 1925.

Clondalkin Paper Mills.

It is reported in the Dublin Press that a Mr. Scher has purchased the above mills, with the property attached to same, and efforts are being made to have a company formed to reopen the concern for the manufacture of newsprint, box-boards, etc.

It will be remembered that these mills, which were connected with Charles Marsden and Sons, had been closed down for a considerable period prior to the troubles of the Becker group of companies, owing, it was alleged, to labour difficulties.

It is rumoured that the mills and property, said to have cost about £300,000, have been sold by the Liquidator to the party named for £45,000.

The reported purchase is significant, perhaps, in view of the fact that the question of further tariffs being imposed on other manufactured goods entering the Irish Free State is under consideration by the Government. However, the wholesale stationers, printers and others are up in arms at the prospect of any duty being imposed upon what they consider their "raw material," namely paper.

Carbon Black.

According to a recent official report, the possibility of manufacturing carbon black from oils by an electrical process, which posseses advantages over the methods of securing this important industrial material from the incomplete combustion of natural gas, has been demonstrated as a result of experiments conducted by the United States Department of the Interior, at the Pittsburgh Research Station of the Bureau of Mines. Carbon black is a finely divided, sooty pigment obtained by causing the yellow flame of methane, or natural gas as it is often called, to impinge while burning with an insufficient supply of air against a cool metal surface. The substance is of wide utility, being employed in the making of paper, printers' inks, automobile tyres, etc.

The importance of these from the industrial point of view will be manifest and great interest attaches to the experimental work in progress. In the course of investigating the effects of high-voltage electrical discharges through hydrocarbons it was noted by the chemists of the Bureau of Mines that under certain conditions natural gas could be decomposed and carbon black produced. The effects of these changes were then studied. The object aimed at in the case of natural gas was to secure the recovery of a larger part of the carbon content of the gas than is now possible by other methods.

About 25 per cent. of the present output of carbon black in the United States is used in printing and allied trades. About 20 per cent. of the U.S. production is exported, large quantities going to England, France and Germany for rubber compounding and being sent to Japan and China for ink, paint and enamel manufacture.

"If Works Committees were formed in every engineering works in the country less would be heard of restriction of output," says Mr. L. E. Mather (Messrs. Mather and Platt, Ltd.).

NO. 38½ MACHINE.

The machine works with double thread and no cuts are made in the section. Tape, ⅛ or ¼ in. cord or canvas can be used if required. End sections are securely fastened by thread, and do not require pasting. The distance between the stitches, as well as the length of same, can be very easily adjusted. The needles are straight and strong—therefore cheap. Strong construction. Simplicity of adjustment, and minimum upkeep.

NO. 23 MACHINE.

The machine will stitch single sections through the fold, or bind books of several sections by stabbing them through the side. All gauges of wire from 30 to 24. Only one adjustment for various thicknesses. The wire is supplied on spools. Also machines of the same type for stitching work up to ½-in. thick.

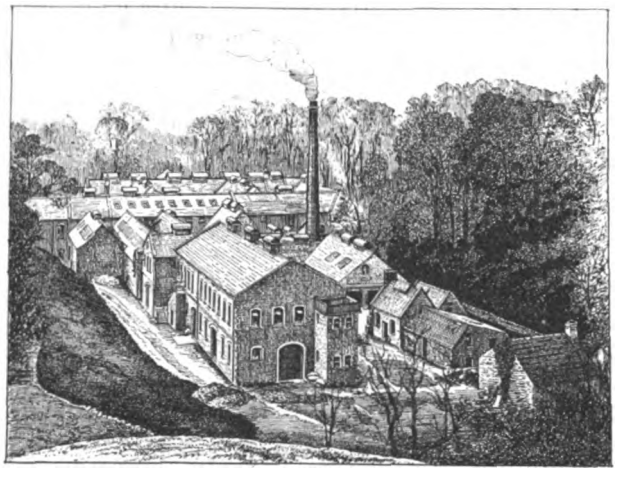
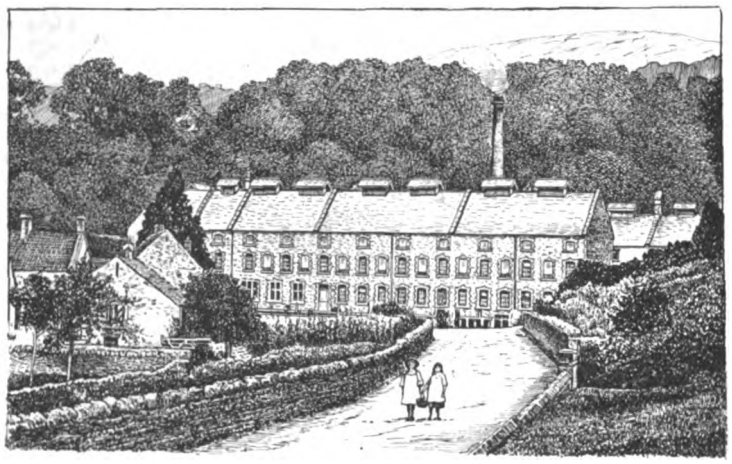
Making Hand-Made Paper for Over Three Centuries.



At Wookey Hole Mill in Somerset, now owned by W. S. Hodgkinson and Co., Ltd., hand-made papers have been produced since 1610. A representative of the *British & Colonial Printer & Stationer* had the pleasure of being conducted over this quaint old mill, which is almost hidden in a valley and surrounded by the Mendip Hills.



One of the natural resources which has helped to give Wookey Hole products the reputation which they enjoy is the unique water supply, which is obtained direct from the source of the River Axe. The rain collects high on the hills above, percolates through the soil and rocks some miles away, finally to appear through a natural cave, which is immediately behind the mill. The time taken to reach the cave is estimated at about 24 hours, in which period it has been rendered practically pure by filtration. This is a great advantage, since it is essential that a mill turning out a good class of hand-made paper must have immediately at hand an ample supply of pure water.

It is interesting to record that in an Indenture dated January 12th, 1610, it is stated that the Wookey Hole Mills, together with all lands, water resources, weirs, etc., were sold to a Mr. James Goodwyn for the sum of £100. At this period there were several mills grouped together under one roof. When the property was conveyed to Mr. Goodwyn, one of the mills was converted into a paper mill, and gradually the whole of the buildings were devoted to this purpose. The mill continued to produce a high-class hand-made paper under the ownership of Mr. Goodwyn. The property subsequently changed hands and came into the possession of a Sir William Doddington. There followed further changes of ownership, Mr. William Sampson Hodgkinson purchasing the mill early in the 19th century. Soon after this the mill was burnt down and the necessity of rebuilding fell upon Mr. Hodgkinson, who added greatly to the capacity and the efficiency of the mill. Whilst the rebuilding operations were in progress Mr. Hodgkinson turned his attention to the village, building houses for the workpeople and erecting a school. Under the Hodgkinson regime the mill has more than doubled in size, and the inhabitants of Wookey Hole have increased from 50 to the present population of over 600.

Messrs. W. S. Hodgkinson's hand-made products are well known to consumers by reason of their distinctive watermarks, and they are further classified as to sizes of the paper made, which range from foolscap to double elephant, special sizes being made if specified. Amongst the varieties produced at Wookey Hole Mill mention may be made of printings, bank note paper, account book papers and drawing papers. In the matter of drawing paper, Messrs Hodgkinson are making great strides. The quality of the W. S. H. brand is now recognised and the paper is becoming more and more popular among users of this class of product.

It may be mentioned that the mill equipment was installed by Alfred Sheldon and Sons, papermakers' engineers, Wells, Somerset.

TWO VIEWS OF THE WOOKEY HOLE MILLS.

Italian Paper Market.

During recent weeks the paper market in Italy has been very active and prices tend to rise. The needs produced by the abstinence of buyers during last summer have brought about a favourable situation for paper mills which have heavy orders in hand and are reluctant to accept others for immediate delivery. It is certainly dangerous to accept existing prices for delivery on very distant dates as it is not possible to make forecasts. The Germans are endeavouring with increasing efforts to capture the Italian markets, but consumers turn to the home industry, which offers great advantages.

Defects in Paper.

Some of the Troubles Experienced by Printers and Their Cause.

Wrinkles of two kinds are often found in shipments of paper. The dry wrinkle is usually made on the rewinder of the machine, and is caused by unevenly calendered paper. The wet wrinkle from a crooked draw at the wet end of the machine is very troublesome and sometimes hard to detect, because it is so fine that it is hardly distinguishable. The best way to overcome troubles from this source is to be positive that all " wet " draws are perfectly straight, showing no inclination to wrinkle. Unclean felts will sometimes cause paper to draw unevenly from one press to another. So will uneven paper-carrying rolls.

Light or thin edges on the sheets cause the printer a great deal of trouble, and the papermaker at times finds it very difficult to overcome this defect on the paper machine, especially when making a sheet which fills the machine to its extreme width. A careful adjustment of slices is one remedy and use of steam in the stock to make it spread more evenly on the wire. "Slow" stock will always cause thin edges, and it is sometimes necessary to put bricks or some other object on the apron board to change the flow of the stock on to the wire, so as to direct as much of the flow as possible towards the edges of the sheet. The wire shake also has an influence on the edges, the longer the stroke of the shake, the more the stock is thrown from the edges of the sheet. A short, rapid stroke of the wire shake is best when this trouble is present.

Sizing Problems.

The sizing of the paper is very important, and very often a slight difference causes difficulty in the printing of the sheet. Book paper manufacturers are inclined to make their papers harder sized than is necessary. Most of the jobs upon which this grade of paper is used in printing require fast drying and the inks used are usually prepared for soft-sized papers.

Having the paper too hard sized also has a tendency to produce curling troubles, which are very detrimental to good printing.

Drying of paper is very important. The writer has seen some very serious troubles arise from uneven drying, which was caused by dryer felts which had become wet in spots. There was no felt dryer on the machine, and when some parts of the dryer felts became wet, they produced paper that would not lie flat.

Bonds and Ledgers.

Most of the above comments on the defects in paper have to do with book papers, but are applicable in most instances to other grades, though, in the manufacture of bond and ledger papers, somewhat different requirements cause defects in the manufacture of the paper that are not present in the making of the other grades. Bond papers must have hardness and rattle. They must be hard sized, good colour and of special surface or finish. The tub sizing of these papers is a very important part of their manufacture and requires very close attention. Some very reliable animal glues are procurable at present, and the papermaker has been relieved of much difficulty in being able to have a dependable glue. The density and temperature of the glue must be carefully regulated and maintained at a desired point, and when the paper is to be loft dried, all kinds of trouble are apt to follow if the tub sizing and drying of the paper in the loft are not carried out uniformly.

Bond papers must lie perfectly flat, and some manufacturers have found it necessary to sacrifice some of the desired hardness of the paper in order to fulfill the printers' call for a paper that will not turn up on its edges. The writer has known of rejections of perfect bond papers as far as all qualities, excepting that of lying flat, were concerned.

Two of the most popular medium priced bond papers on the market, and the most satisfactory to printers, are papers that do not have the rattle or feel of a real bond paper, and yet they meet all requirements, and are free from most of the complaints that printers turn in on these grades of paper.

Dirt specks and spots are prohibitive in bond papers of the better class, and this means that mills making such grades of paper must be ever on the alert in seeing that cleanliness in the mill and material used comes first in all things. The fine dirt usually comes from water or water pipes. Despite the most complete filtration system, all of the water cannot be properly cared for. From the time the water leaves the filters it must pass through pipes on its way to the beaters, washers and machine, and these pipes accumulate dirt, which is conveyed by the water to wherever it goes. To overcome this condition as much as possible, the water being furnished into the beaters is run through felt and wire screen, but in many instances the water used on the paper machine is not, and some of the dirt specks originate from this source.

Keeping machine clothing in good condition will do much towards making paper uniform in quality. It is reasonable to believe that the same felts when new will give a different character to the paper when they have been run for some time and become filled up; therefore, any appliance that will help to keep felts in good condition is bound to be an improvement.

Importance of Packing.

Next after the quality in manufacturing paper comes the packing of it, and this should be carefully done in order to give the stock proper protection. Many of the complaints that come to the mill represent things that happen through poor packing. No one has yet discovered a method that will properly protect the top and bottom reams of a bundle or case of paper, and the waste from this source is a very great annoyance to the buyer.

When all is said about defective paper and the cause of same, we all realise that just so long as the human element in manufacture must be depended upon, we will have repeats of these complaints, but they can be done away with, to a great extent, if we can put the various methods in making under mechanical control. In papermaking this is impossible in many instances, and therefore we must continue to hammer away at the same old job of doing the best we can. We can do a lot towards improving present conditions by securing the co-operation of the user of paper. Papermakers and the men who use their product are not close enough together on questions affecting each others' welfare. Printers should visit paper mills and papermakers should never miss the opportunity of seeing paper printed. Some day this will be realised, and then we can look for improvements over present conditions.

Insulating Paper.

In the course of an article in the *Manchester Guardian Commercial* on the manufacture of electrical cable-making at the works of a prominent Manchester firm further evidences are given of the important part paper plays as an insulating material. After briefly describing the use made of rubber as an insulating material for lighting purposes, the writer goes on to state that another great branch of output is the paper lead-covered cable generally used for power purposes. The conductor is lapped with a paper di-electric, which is impregnated with an insulating compound before it is applied to the conductor.

In the making of dry-core or air-space cables for Post Office telegraph and telephonic work, the paper lapping is not impregnated, but is applied to the conductors with some looseness, with surrounding lappings of string as separators. These cables in complete form contain a great number of other small wires, and each wire is contained in its own special colour of paper lapping.

Envelope Makers & Manufacturing STATIONERS.

Annual Meeting of the Employers' Federation.

Mr. J. Leonard Spicer presided on Mar.6th at the annual general meeting of the Employers' Federation of Envelope Makers and Manufacturing Stationers, and amongst those present were:—Messrs. Frank Appleton, C. Brooks, J. B. Browne, R. S. Dove, R. H. Frost, James Gallie, G. Hamilton, F. G. Hawdon, T. Owen Jacobsen, G. H. Marshall, H. A. Mead, C. M. Oliver, S. Reed, S. E. Sandle, Walter Shaw, H. J. Totman, Stanley Welch and H. F. G. Wood.

Annual Report.

The seventh annual report, which had been circulated to members in advance of the meeting, mentioned that during a period of striking political changes in this country and disturbed conditions all over the Continent of Europe, manufacturers of envelopes and stationery in Great Britain had continued with the development of the industry to meet the new conditions. In a reference to rates of wages and conditions of employment, it was stated that the relations between the Federation and the trade unions continued to be of a satisfactory character. It was claimed by the Council that the work of the Federation in reference to the Railways Act had been of great value to the members.

Postal Matters.

A reference was then made in the report to the fact the International Postal Convention last year had adopted the resolution of the postal authorities in this country re-admitting into the international post the two-piece type of outlook envelope. The report also mentioned with satisfaction that the postal authorities are more than satisfied with the success attending the "strong recommendation" issued in regard to "Trap" envelopes, in which result the Federation played a part, and that the Post Office fully appreciates the assistance given to its efforts by envelope manufacturers.

On the subject of freight rates to India the Council reported as follows:—Orders for stationery from India having been cancelled solely on the ground of the difference in rates of freight from United Kingdom ports and Continental ports to India, representations were made to the London Conference. As a result a concession was obtained for cheap commercial envelopes shipped from United Kingdom ports. Considerable pressure was exerted to obtain like concessions on all stationery, but so far the attitude of the Glasgow and Liverpool Conferences had rendered these efforts nugatory. Individual members can do much to educate the lines loading from these ports as to the need for lower rates of freight.

Under the heading of the Irish Free State, mention was made of the difficulties experienced by members with regard to consignments to destinations in the Irish Free State, under the headings of statistical stamp required on customs entries, high cost of delivery to inland towns, and Merchandise Marks Act. In regard to the latter item, the council had received a report upon the action of the Free State Customs authorities in stopping consignments of stationery entering Irish ports from Great Britain, on the ground that each envelope or piece of stationery should be marked "Made in England."

The Chairman, in moving the adoption of the report, emphasised the important part that the Federation was playing in the councils of the employers' organisations of the country. Conditions had been such as to provide the Federation with continued opportunities for service. Mr. Spicer went on to speak of the vast amount of work, in one form or another, which was performed by the staff and mentioned the great efforts which were involved in order to safeguard the interests of the Federation. During the two years he had occupied the position of President, he had been surprised and gratified at the way in which his industrial being had been the constant care of Mr. Armstrong and his assistants. It was difficult to compute in pounds, shillings, and pence the cumulative effect of the steadily growing efficiency and influence of the Federation, but he assured the members that whatever subscription they paid into the Federation it was a very sound investment.

Mr. H. A. Mead seconded and the report was unanimously adopted.

Recovering from the Slump.

The report of the treasurer, presented by Mr. Appleton, mentioned that although the total amount of subscriptions received was still below that received in 1921, the amount received for 1924 was greater than that received for 1923, whilst that in its turn was greater than that received in 1922. The basis of subscription being the number of persons employed, the figures indicate and reflect the gradual recovery of the industry from the slump conditions.

The New President.

Mr. Spicer said it was with the greatest pleasure that he proposed Mr. T. Owen Jacobsen as President of the Federation for the coming year. Mr. Jacobsen had taken a lively interest in the doings of the Council, and was very regular in his attendance. The interests of the Federation could not be placed in safer hands.

Mr. J. B. Browne, as Mr. Jacobsen's nearest competitor, seconded the motion, which was cordially adopted.

Mr. Jacobsen, after suitably acknowledging his election, proposed that Mr. F. G. Hawdon be elected to the office of Vice-President. Mr. Hawdon, he observed, had done good work for the Federation right from the beginning.

Seconded by Mr. Oliver, the resolution was carried unanimously, and Mr. Hawdon appropriately acknowledged the compliment conferred upon him.

On the motion of Mr. James Gallie, seconded by Mr. W. Shaw, Mr. Appleton was re-elected Treasurer.

Thanks to Mr. Spicer.

Mr. Appleton, in proposing a vote of thanks to the retiring President for his extraordinarily able conduct of the presidential duties during his two years of office, observed that the members of the Federation could not allow that opportunity to pass without expressing their appreciation of Mr. Spicer's valuable services.

Mr. R. S Dove seconded the resolution, which was carried with enthusiasm.

Mr. Spicer, in reply, said his term of office had been a happy time, and the work, though intense, was interesting. There was a sympathetic atmosphere in the work of the Federation which assisted one to work well.

Mr. F. L. Cayzer.

Retirement After Nearly 50 Years in the Paper Trade.

In view of the closing of the voluntary liquidation of James Spicer and Sons, Ltd., which was necessitated by the amalgamation of that company with Spicer Brothers, Ltd., Mr. F. L. Cayzer, who was appointed joint liquidator, has suggested to his managing directors that it might be a suitable opportunity for him to terminate his period of nearly 48 years in the Spicer service. The board have acquiesced in Mr. Cayzer's proposal and have made the pathway clear for him by granting him a pension in appreciation of his past services.

Mr. Cayzer will, therefore, resign his directorship of the company at the end of the present financial year, namely March 31st next, and will then close his long business career with the good wishes of his fellow directors and all those he has been associated with for so many years.

Few men in British paper trade circles are more widely known or more highly respected than Mr. Cayzer, who has been identified with most of the social and public movements of his time. During his close upon half-a century with Messrs. Spicer, he represented them in many capacities and always with strict integrity and marked efficiency. When he started as a boy of 16 the firm of James Spicer and Sons had been established some 12 years, the founder breaking away from Spicer Bros. in 1865. Mr. Cayzer's services to the company ranged from office boy to director. Early in his long career he went out on the road and carried the name and fame of Spicer to town and country. He has had charge of selling and buying departments, and has even represented the firm abroad, going to Australia for a term. Later he became secretary, and he held this honoured position for several years. Finally, when in 1922 the business of James Spicer and Sons was amalgamated with that of Spicer Bros., under the style of Spicers, Ltd., he joined the board of directors.

On the social and benevolent side of the paper trade Mr. Cayzer has been a conspicuous figure. He was W.M. of the Papyrus Lodge in 1915-16, and is at the present time treasurer. He is also a Pastmaster of the Royal Thames Lodge and has been through the chair of the Old King's Arms Chapter.

He was elected President of the Stationers' Social Society in 1904, is now one of the Trustees, and has always been regular and conscientious in the discharge of his duties as member and officer.

Another direction in which Mr. Cayzer has exerted himself has been in connection with trade and other exhibitions. Last year, it may be remembered, he was chairman of the Exhibitors' Sub-Committee for the Paper, Printing and Stationery Section of the British Empire Exhibition.

After all these activities, Mr. Cayzer is entitled to rest from his labours, and he and Mrs. Cayzer will go into retirement at Bognor with the best wishes of "troops of friends."

"GOLDFILM" BLOCKING FOIL

(IN ORANGE, LEMON AND SILVER SHADES)

Made by an entirely New and Patented Process. A boon to all users of Gold Leaf, Foils, &c.

FRANCIS J. Connolly LTD UNION WORKS 60 PARK ST. S.E.1

MARINONI-VOIRIN

The Oldest Firm of Lithographic Machine Builders in the World

FRANCIS J. Connolly LTD UNION WORKS 60 PARK ST. S.E.1

PRINTING TRADES' EXHIBITION : 1925

WE are exhibiting MORE Advanced Offset Machines on our Stand No. ONE, Entrance Hall, at the 1925 Printing Trades' Exhibition, Agricultural Hall, Islington, London, N. 1, from May 16th—30th.

These Exhibitions are landmarks in the history of the Printing Trades and at the coming Exhibition we shall show the most modern labour-saving machines—from the Medium sized Single-Colour Offset to the large Perfecting and Two-Colour Machines. Marinoni-Voirin have been associated with all the improvements in Lithographic Printing Machinery since they built the first Flatbed Lithographic Machines.

Particulars of these Offsets and other Interesting Machines will be published later.

Our general catalogue is yours on request.

Organisation in the Paper Trade.

Important Propaganda Meeting of the National Association of Wholesale Stationers and Paper Merchants.

A special meeting was summoned by the National Association of Wholesale Stationers and Paper Merchants at the Cannon-street Hotel, London, on February 25th, the object being to introduce the facilities and advantages of the Association to a larger number of those interested. There was a very large attendance. Mr. A. Dykes Spicer, president of the National Association, was in the chair.

The president, in opening the proceedings, said the meeting had been called for the purpose of strengthening and reinforcing the distributing and stockholding interests of the paper trade. He outlined in detail the negotiations which had been and were being carried out with the English and foreign makers and paper mill agents and the printers on the subject of trade relationships and trade customs. Naturally a great deal of smaller work had been done and that went along regularly. The vital point, however, was that the members of the distributing trade had not had the courage to sink themselves and their varied interests in the common pool of organisation and progress. Mr. Spicer made an appeal to those who were not members of the Association to join its ranks. This was certainly the day for the big battalions, he said, and it was only when numbers were present that anything notable could be accomplished.

A Strong Association Necessary.

Mr. F. M. Carson said: I was reminded only the other day on looking at my calendar to "Let a trouble tarry till its own day comes." It is because we feel that the day of our trouble has not only come but has been with us too long that we ask you to come here to-day, and it is a great pleasure to us to see so many of you present. It seems to me, gentlemen, that it is absolutely essential that this organisation of ours should exist. We have from time to time in the history of our trade small associations formed in various parts of the country with the idea of trying to get some organisation into what is unfortunately a very unorganised trade. These associations have done a certain amount of good, but they have all failed from the main point of view when we came to deal with the bigger aspects that we have to face from time to time. We want to get an association of the greatest possible numbers and efficiency. As the chairman has pointed out, we have had occasions when we have been within an ace of getting our recommendations carried by the various bodies we have approached, and yet at the last moment we have failed by reason of the impression on the minds of those with whom we were negotiating that our numbers were not sufficiently strong to justify the taking of what might be to them a very serious step.

I am afraid that there has been an impression given in certain correspondence which has appeared in the trade papers recently that this is a new association. You will have seen from the brochure in your hands that we are celebrating our 21st birthday. Our youth has gone by; we have now attained the region of manhood; we have been allowed the "key"; and it is our desire that we should turn that key so as to open up a place of greater freedom and profit than we have occupied at all events for the last few years. We have got this to consider, that if we were an association designed or desirous of doing good only to our own portion of the trade—well, I for one should not be able to come here this afternoon and speak to you with any earnestness of purpose. It is because I do feel that if we can establish some form of organisation in our trade we shall be benefiting not only ourselves but the whole trade in which we are engaged that I am venturing to make this appeal to you to-day. It is quite easy to realise that the almost stupid competition which is going on in the trade to-day must react not only on ourselves but in the last degree upon the mills who are our friends and the suppliers of the commodity we sell.

The Chairman has given us a brief resumé of some of the work that we have undertaken during the last few years and he has dwelt upon just one or two of the larger aspects of the case. But there has been a very great deal of work done in addition to the negotiations to which he has alluded, and he will forgive me if I mention one or two of the directions in which this work has been carried out.

Useful Activities.

The conferences both with the mills and with the printers have done good in certain definite respects, but over and above this I am quite sure that we havecreated an atmosphere which, especially in such a time of difficulty as we are encountering to-day, will enable us if we are strong enough in ourselves to make such arrangements as will be for the general good. In addition to those negotiations, we have carried out others with the railway and shipping companies. Only the other day we had a meeting with representatives of all the railway companies to see whether there could be a better and speedier handling of goods. We also approached certain of the foreign shipping companies. In our export business we were faced with an arrangement on the Continent whereby paper was shipped on weight instead of on measurement rates. We have been successful in a sense in obtaining concessions from the shipping companies so that at all events some classes of goods can be taken on weight rates instead of on measurement rates.

Then we have an Inquiry Department which is of the greatest possible value. I suppose we have in that department records of 25,000 or 26,000 firms in this country with whom you are dealing every day. The information that we have, which is not only obtained from the usual channels, but is supplemented by our own actual experiences with these firms, has been of the greatest possible service.

We are desirous also, if we possibly can do so, of establishing some Court of Arbitration. Disputes will arise, and when all the efforts made in the ordinary way to settle matters by friendly negotiation have failed, the only thing left is an appeal to a court of law which is costly and slow. If we can get our kindred associations together we shall be able to form a Court of Arbitration which will enable us to settle the bulk of disputes in a friendly way.

I do not believe that the paper trade as a trade is in the same category as the very large majority of trades in this country. The paper trade is a trade of necessity, not of a trade of convenience.

Sales and Prices.

In certain trades of convenience increased sales can undoubtedly be obtained by reduced prices, but paper is such a useless article in itself that no one except of necessity will buy it. I say this because I feel that the increased competition caused by unnecessary salesmanship is not increasing the bulk of paper sold, but only decreasing its selling value. I have had the opportunity in the course of the last few months—and I should like to pay a tribute to the courtesy given me in this connection—of examining the details of the gross profits upon which some of our businesses are run, and I do not know whether you are going to agree with me from your own experience, but I have found in the course of the last three or four years that the proportion of gross profit on which we are supposed to run our businesses has been lowered by something like 6 or 7 per cent. Now, gentlemen, if you take those figures as being more or less accurate you will find that you are in this position: to day is not a day when you can honestly go to your workmen and reduce wages, because we do not find that the cost of living has been reduced. We are either having to keep up our establishments and pay the wages we used to pay on this reduced gross profit, or else we have—what is equally annoying to us—to reduce our staffs to the lowest degree compatible with bare efficiency. I am speaking from experience and from information given to me, and I suggest to you that that state of affairs is pretty nearly correct, and that you will find if you examine closely the figures of your own firms that they are not very different. It is essential, therefore, if this business is to continue to be a profitable business that those concerned should fall in line with the main current of business in this country. We find that other businesses are organised as closely and efficiently as they can be, and it seems to me rather a pity that we should be one of those trades which have not exhibited any particular power or organisation.

There is only one way out of the difficulty. In my own share in negotiations with various bodies, I have heard it said: "We believe your argument to be sound, but you are not strong enough to carry it through." Well, we have asked you to attend here to-day in order that we may appeal for your co-operation. I am going to suggest to you that if you feel after the arguments used this afternoon that you are in general agreement with the work of the Association you should support a resolution which will presently be moved expressing that agreement and pledging those present to support the work we have undertaken.

Fundamental Basis of Success.

Mr. H. Bradly said: I am very pleased to see such a representative gathering to-day of wholesale stationers and paper merchants. My firm have been members of this Association since its birth, but I am sorry to say that Mr. Walter Howard, who has always been our active representative, is now laid aside by illness, and his absence is deeply regretted.

We are all naturally deeply interested in the success of our trade, which is an integral and essential branch of the paper industry of this country, and I am very sensible of the honour in being asked to address you to-day, when I am sure there are many here who could do it so much better. My business, however, has always been my hobby, and I hope that my views on some part of our programme, which has been formed from a very varied experience, may be a little helpful in fostering your interest in the welfare of this Association.

The fundamental basis of our success, as just mentioned by our chairman, must, of course, rest chiefly on our sources of supply—the papermaker at home and abroad—and it is in that connection that I would like you to give me a hearing. I think that the conditions in each case are so similar that it will simplify matters if I treat them as one.

It is idle to contend that our arrangements with the makers are working at all smoothly, and our friendly relations with them are suffering in consequence. I believe this opinion is also shared by the makers, and as I know so many of them, they will understand that anything I may say, is in no sense antagonistic to them.

The trouble all arises from one thing—no ordered method of distribution—which has created an internecine and disorganised competition between us. In the main, this goes back to the great slump which occurred in 1921. It was entirely unforeseen, and there were no means then existing of providing against it.

I am convinced, however, as I mentioned at a similar meeting to this, held recently at Manchester, that if there had been any proper understanding between a strong National Association and the Papermakers' Association before, during and immediately after the war, that these conditions and their evil effects would not have been nearly so bad as they have been and are to-day.

In 1921 the merchants were heavily loaded with stocks bought at high prices, caused by what we now know to have been an artificial demand, and which drove us all to buy, naturally enough, to protect ourselves on a rapidly rising market. This temporary boon came very quickly to an end, and we were all left with these large stocks.

I was interested in papermaking at that time, and my mills had a waiting list of orders of anything between 10,000 and 20,000 tons at prices to be fixed when deliveries could be definitely promised. When the slump arrived these orders became so much waste paper, and the mills were left high and dry for want of business to keep their machines running. So much for the makers' position at that moment. They had bought large quantities of high-priced pulp and the merchant had equally large stocks of high-priced papers.

At this late stage, it is useless to discuss what might have been done, because there was such a total lack of cohesion between either section of the trade, and such arrangements as were then made were not of sufficiently universal application to have been really effective. I do not believe that our associations on either side were sufficiently strong or united to at all adequately control the situation.

Everyone was fighting for his own hand,

Digitized by Google

and the maker went along the line of least resistance, and sold his paper to anyone who would buy it, not to the merchant only, but to the jobber, and even to the consumer. The mills in their anxiety to keep their work-people employed, and to turn their materials into money, sold paper at prices far and away below the figures at which the merchants had bought their stocks. Mill stocks went past the merchant, leaving him landed, and he eventually had to make such terrific allowances for depreciation that in many cases his financial resources were considerably weakened. I do not think even to this day that the makers realise how unfairly this state of things reacted on those who had been their best customers. So much then for the merchants' position, and it may be said that they have not long since been able to rid themselves of the incubus of these old stocks.

Having seen so much of the question from both sides (and that is largely why I am speaking to you to-day), I have to agree that the makers' financial position was affected too, but it does seem to me that the policy then pursued—I am speaking broadly and generally, of course—was extremely shortsighted, and more than anything else responsible for the chaotic conditions to-day. Not only are a great number of mills selling direct to the printers or using thinly veiled disguise of an intermediary at 1¼ per cent., but they are also selling to the consumer, the printer's customers, a practice not only unfair to us all, but equally unfair to their brother makers.

Manifold Competition.

Thus there is a manifold competition. The mills who need only compete amongst themselves have also the competition of the merchant and the printer, and through them the importation of foreign qualities. The result is that the maker of any quality in particular instead of having a dozen competitors, probably all friendly to each other, has created a hundred, or it may easily be a thousand more.

We have heard much of the shortcomings of the stationer, but he must be acquitted of most of the blame when he has to face conditions such as these. The stockholder, who I contend a wholesale stationer or a merchant must be, is as essential to the maker as to the printer. It is only he, carrying, perhaps, a couple of hundred varieties of paper in his warehouse—in the case of my firm this means between 2,000 and 3,000 different items—who can accomplish an economic distribution of the makers' products. And to contend that a merchant's overhead charges can be met by such part of his purchases as actually pass through his warehouse is as illogical as it is unsound.

Now the mills are largely carrying stock too. By standardising their products (which could be better effected in collaboration with the merchants), they can produce more cheaply, but what is the use of that when any saving is completely lost by the ridiculous competition I have referred to.

It is simply a policy of opportunism, and with good trade these stocks would mainly disappear. As it is, these mill stocks are largely a duplication of the merchants' stock and the amount of capital tied up in this overlapping, with unnecessary warehouses, double handling and freight and overhead charges, is enormous. This competition between the maker and the merchant means that such costs come out of the profits of one or the other, and certainly not out of any additional price.

Complementary to that is the placing on the market by the home mills of a monthly production of over 100,000 tons, when probably that market can only absorb 80,000 or 90,000 tons. Cutting prices does not dispose of the balance, but merely weakens or reduces the price of the whole. More pulp than is justified is bought and the maker forces the cost up against himself, whilst he is depressing the price of his manufactured paper. That, gentlemen, is exactly the position to-day.

The whole effect of the present system recoils on the mills themselves, and the merchant, who is doing the donkey work, cannot turn over his stock a sufficient number of times to cover his overhead charges, and leave a working margin of profit.

I say that the present system has failed and, strangely enough, it applies equally to both home and imported papers.

I wonder how much longer the stationers of this country are willing that this state of things should continue, and I wonder how long the makers are willing to go on pauperising themselves and their customer by such "Monte Carlo" methods?

It may be said that I have laid too much stress on the makers' responsibility, but whichever way I turn in reasoning the matter out I am inevitably brought back to it.

The makers may retort: What of your Association and its strength? I must agree that when I was on the mill side there was not a sufficiently representative body to deal with, and one felt that there could be no assurance that agreements entered into between the two parties would not be torpedoed from outside. The Association is stronger to-day, but I think I have said enough to show, firstly, the need of a really strong National Association, and secondly, that it must be fully and absolutely representative.

Control and Discipline.

One of our members at Manchester recalled the old days of Control with which I was intimately connected, and also reminded me of the way I ticked him off when I was a Government official. Yet he proposed a return to that Control—as being the lesser of two evils, I suppose.

No, what we have to do to-day is to control and discipline ourselves. Independent action by sectional or local organisation cannot have the weight, and we must unite our forces to get a sufficient move on this waterlogged ship of ours.

I would remind you that over 350,000 people in this country are directly interested in the paper, printing and allied trades; and I do not know of any other industry, so largely of concern to the nation as a whole, that is carrying on in such a precarious manner.

We want every stockholder to become a member of this Association. By doing that he is doing something to help, as it is only numbers which count. We can then go to the makers and say: Here is a large and responsible body who is prepared to help you in bringing order and method out of this madness. Such action will be, I am sure, of the greatest assistance to the other side as well. They are waiting for us, but it must be all of us, and all of them.

Obviously to safeguard and promote the interest of us all, we must all join hands in one National Association, and we shall then find the papermaker willing and ready to give us a square deal. Each association would strengthen the other, and out of the after-

CAPACITY

THE profit earning value of a composing machine depends upon its capacity.

The Intertype operator can have twelve faces at his disposal without leaving his chair.

When it is necessary to change a magazine it can be removed and another one substituted in less than ten seconds.

These are some of the advantages which make the Intertype the most profitable machine of its class, and account for its outstanding success.

We can easily show you how the Intertype can increase YOUR profits.

Send for

math of the past, an industry would be in existence of which we should all be proud, which we certainly are not to-day.

Then, having obtained our material, construction would commence. Ideas and method would be put forward and hammered into shape by both producer and distributor. The producer produces and the distributor distributes what is necessary and eliminates the unnecessary.

Surplus pulp, surplus paper and surplus stocks are no longer with us, but the necessary requirements of the trade producing the necessary revenue for us and our workpeople, and especially for the reconstruction of many of our mills which badly need it. It is only by such combined effort that waste, overlapping and duplication in every branch can be eliminated; and it is entirely to that that I look for profit, as I am a whole-hearted believer that cheap paper is what will bring success to the industry in the long run.

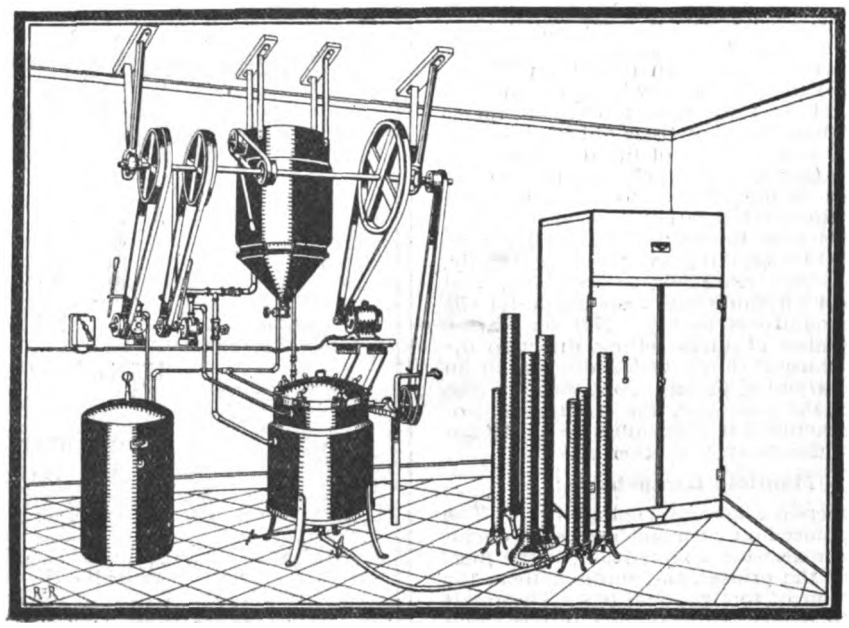
It is up to the maker to cease being a wholesale stationer or to come out into the open and declare himself as both. He will find that in supporting an economic method of distribution through the stockholder, and making it impossible for anyone who is not to unfairly compete—that he has only then to provide capital for his own business, and by limiting the competition to a strictly necessary dimension that his profits are not being needlessly frittered away. The merchant can then get into his stride again. He can get on with standardisation, which will be of untold benefit to the printer, the maker and himself.

We have the friendliest relations with the Master Printers' Federation, and it is up to us to strengthen ourselves in every way possible and prove our ability to give them service all the time. I won't go into the details of standardisation to-day, but would just mention that a strong agreed policy in this matter will cut out wastage, reduce stocks, improve quality, reduce costs and eliminate a mountain of unprofitable detail.

One other item in our programme I would refer to, and that is arbitration, briefly referred to by Mr. Carson. Disputes will happen, but I am optimistic enough to venture a hope that if the scheme I have outlined once gets going such things will largely disappear. Legal process is always costly and never satisfactory, and I am sure that our members will welcome a method by which these questions can be settled in a friendly way. Our idea is that our Executive (with power to co-opt) should form a panel from which two members with knowledge of the grade in dispute would be drawn and that we should approach the makers and the agents' associations to provide similar panels. This should form a very practical method of voluntarily dealing with such questions with a minimum of time and expense. I think that this would also appeal to the master printers and other allied traders, with whom it could work in conjunction. Gentlemen, I ask you for your strongest support of our Association and would ask you to use your influence with any of your friends who may not be present to-day.

At the conclusion of these three speeches, the audience were invited to take part in the discussion.

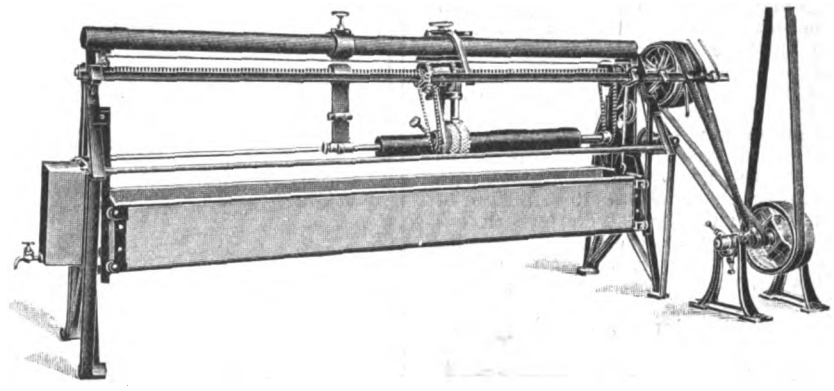
Resolution of Support.



Mr. A. P. Burt said that it was with very great pleasure that he saw so many members of the trade present on that occasion, and he did hope that there would be a practical outcome of that meeting. The very best efforts of the Association had had much smaller results than they desired, simply because of the lack of members. It was always the cry of those on the other side in the negotiations that the Association was not sufficiently representative of the trade. Therefore the interest shown by the very large attendance that afternoon was all the more gratifying and hopeful. It was the strong desire of the Council to welcome into membership the smaller firms down to the very smallest of those who were legitimately occupied in stockholding. Every additional member was of service to the Association, and he hoped that none of those with small stocks would think that they were not wanted. They were wanted just as much as the bigger people. This applied especially in the Association's dealings with the British mills, and with foreign mills. He then proposed the following resolution: "That this meeting of paper distributors is in general accord with the aims of the National Association of Wholesale Stationers and Paper Merchants and pledges itself to support the Association."

Pneumatic Book Printing—Mass Production. Regeneration and Roller Casting Apparatus,

ALSO



Vacuum Plants for Roller Casting Works for daily productions of 50-5,000 kilos (1¼ cwt. - 5 Tons).

Over 400 in use. First Class Testimonials Received.

MAX SADOWSKY, **Machine and Apparatus Builder,**

96, PRINZEN STRASSE, BERLIN, S.42.

Telegraphic Address: "SADOWGUSS."

AGENTS WANTED IN ALL PARTS.

Mr. Sydney Spalding seconded the resolution. He urged that the resolution should be carried not only in that room but outside by each person who had been present engaging himself to further the work of the Association in every way possible. If once a member joined he would find that there were a great many questions on which he could be very helpful, and every member so joining represented an accession of strength.

Mr. L. F. Bate said that most of the prosperous traders in this country were associated, and that a considerable degree of their prosperity was due to the fact that they had associations and that their interests were focussed in one central point in the shape of an association whose work it was to collate and bring together the interests of the trade as a whole. Almost alone among the trades they as distributors had not an efficient organisation, and consequently in any negotiations they were in the unfortunate position of the corn which was ground between the upper and the nether millstone, and sometimes they were "ground exceeding small.' Wherever there was an association of interests, those interests should form an organisation, where the general good could be furthered. He had listened carefully to the discussion and he had not heard that any dire results would follow in the case of anyone through joining.

The President then put the resolution and asked that it might be supported not only by a show of hands, but by enrolment in the Association.

The resolution was carried unanimously.

A HOLIDAY POINT.—The Newport branch of the Typographical Association asked the executive council for advice in reference to a holiday claim at an office where the weekly half-holiday was taken on a Thursday. The members concerned were of opinion that they should receive a half-day's holiday in lieu of the half-day they had lost in consequence of Christmas falling on a Thursday. The council decided that no claim could be made for a half-day's holiday, as the members had received a full week's wages.

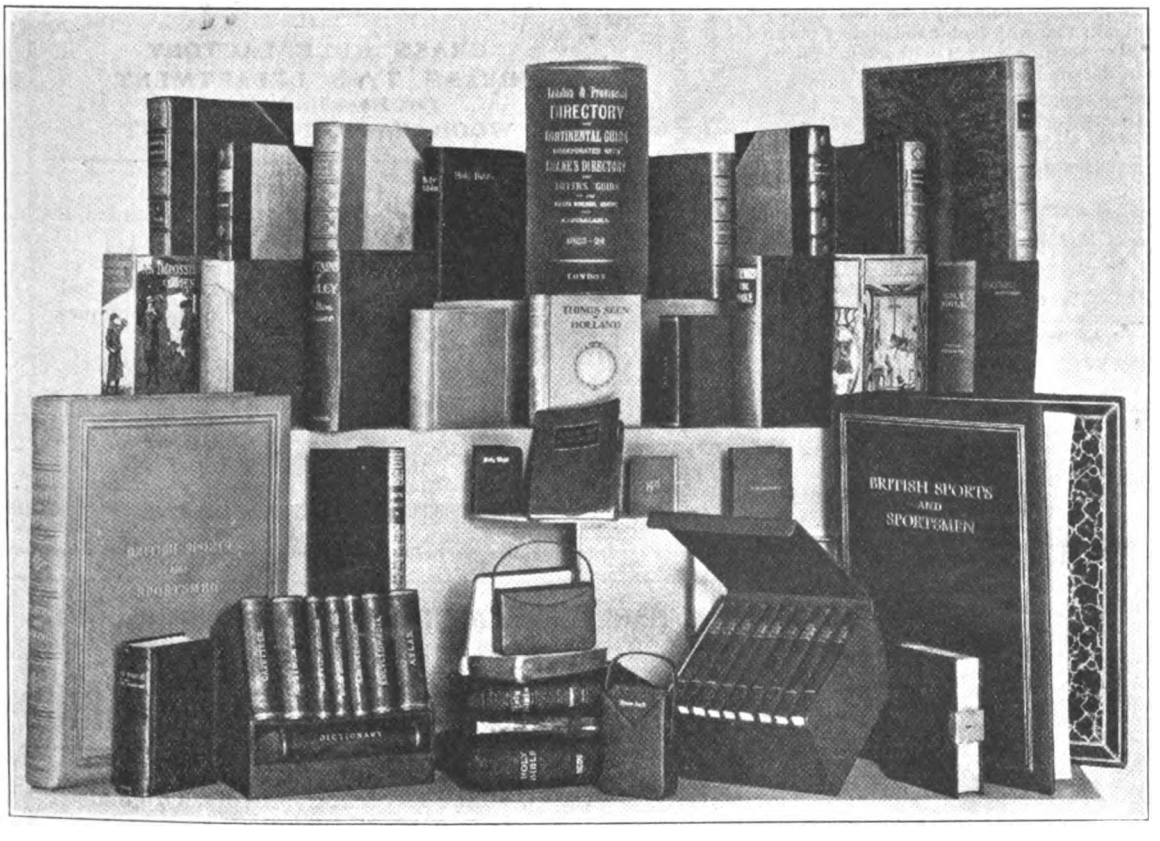
AN AID TO EFFICIENCY!

A Typical
Push Button Station.

The Electric Drive has played no small part in the wonderful efficiency of the modern printing plant, yet by a specialised knowledge of its application it can be made to play even a greater part.

For over 12 years we have exclusively studied and applied the electric drive to printing machinery, large and small, and have utilized this experience in the design and manufacture of our gear.

Our Driving Equipments embodying Full Automatic Control (Push Button Box illustrated) are designed to obtain the very best out of the driven machine, and to cut out the waste motion and needless attention of the machine-minder in operating electrical apparatus about which he is ignorant.



FOOLPROOF—RELIABLE—and THOROUGH THROUGHOUT these equipments are a most positive aid to increased machine-room efficiency.

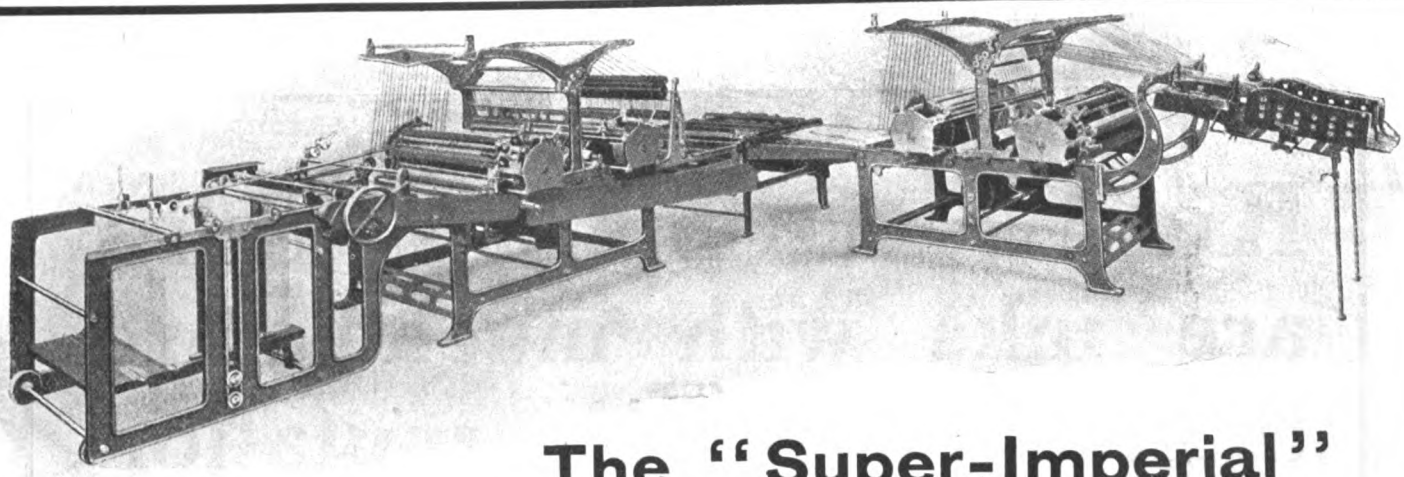
Kidd's Printing Inks are inks with much more than a century's reputation

Progress has ever been Kidd's watchword. No real improvement in ink manufacture during all those decades has been neglected by them, so that their inks to-day represent ink making at its best.

In their price list you will find inks for Letterpress, Litho, Offset Litho, Tin Plate Printing, Relief Stamping, Photogravure, and a number of other purposes—all at that strictly moderate price which has invariably characterised Kidd's Inks.

ARE CAST TO LAST

If you cast your own rollers do it with the celebrated "J.K." composition. It is made in strengths to suit all climates.



There are no rollers anywhere made of finer composition or with more modern appliances, consequently there are no better rollers.

When you want your rollers re-cast they should be sent to the works, 419, Old Ford Road, London, E.3, not to Wine Office Court, nor to Birmingham. If you send them by rail they should be packed in boxes suitable for their return.

JOHN KIDD & CO. LTD.

The "Super-Imperial"

Four-sider Disc Ruling Machine.

For Feint Lining only or Feint Lining and Striking 2, 3 or 4 Colours on both sides of Sheets, both ways, at one operation.

With Latest Model Ream Feeder attached, Patent Pile Feeder, or Patent Pile Suction Feeder, with Single or Duplicate Tables.

This Machine will rule both sides, both ways, at one operation, at the rate of 10 to 15 reams per hour, according to size of sheets.

Improved Patent Turn Table and Latest Style Layboy with Back and Side Joggers, included with machine. The "Bailey" Patent Rotary Perforator Attachment, and Shaw's Patent Sheet Cutter can be attached.

A large supply of Discs and Spaces and Disc Rods, and full compliment of Accessories supplied with each machine.

Two Horse Power only required to drive Machine and Feeder, either from Shaft or direct from separate motor. **One Drive** only necessary.

This Machine is very fast, and saves time and labour in handling paper. A very good class of work can be obtained.

We can add Patent Turn Table to our Single Sider Disc Machines and well-known Striker Pen Ruling Machines, for Feint Lining only or Feint Lining and Striking, on one side of the paper **both ways at one operation.**

For Hand Feeding only or with any of our different classes of Feeders attached. We can supply machines both for Hand Feeding and with Feeder combined.

THE BRITISH & COLONIAL PRINTER

FOUNDED 1878. AND STATIONER PUBLISHED WEEKLY.

WITH MONTHLY SECTION FOR THE BOOKBINDER.

The Recognised Organ for Printers, Printers' Engineers, Wholesale and Manufacturing Stationers, and Makers of Machinery and Appliances for the Paper Bag, Envelope, Box-making, Bookbinding and all Paper and Board Consuming Industries.

VOLUME 96. NUMBER 13. [REGISTERED AS A NEWSPAPER.] LONDON: MARCH 26, 1925. EVERY THURSDAY. PRICE TWOPENCE.

Printers' Costing Problems.

VIII.—Interest on Capital as an Item of Cost.

In view of the increasing necessity for the adoption of up to date and scientific methods of printing-house management, an expert in the subject of printers' costing is contributing a series of articles to this journal. The present article is the eighth of this series, and others will follow at intervals. Questions and discussion are invited.

The Master Printers' Federation Costing System lays it down as a principle of great importance that interest on the capital *employed in the business* should be treated as an item of expense. The words in italic should be noted particularly.

Around this topic much wordy warfare has raged, much ink has been spilled, and many heads have been shaken in disapproval or nodded in agreement. It can be stated, however, that opinion is steadily veering round to the interest inclusion point of view.

A Printing Custom.

This principle has by custom been established, at any rate in so far as the printing and allied trades are concerned. It may also be taken for granted that any organisation of trades setting up a standard system of costing will be obliged to recognise the importance of including interest as cost.

Careful Discrimination Needed.

Many persons do not discriminate between interest on capital and profit, but there is a wide gulf between them. One is the reward of waiting, the other the reward of working—one is passive, the other active. Interest on capital is as much a cost as are the wages of labour.

A Distinction and a Difference.

There is a delightful simplicity about some of the opponents to the inclusion of interest as a cost. They will readily agree that a loan, no matter its nature, is entitled to interest, and resent any suggestion that interest on an overdraft is not a cost. They fail to see any relation between capital borrowed to overcome a financial stringency or to meet the requirements of an exceptionally large contract, and that already in use by the firm. In effect both sorts of capital are borrowed by the business and it matters not a whit whether lent by Tom Jones who owns the concern or Richard Knight who has a superfluity of wealth, but has no active connection with the firm. Once invested, no matter the origin, capital in business flows along the same channels, renders the same services, and has no dual identity.

What the Lender Expects and Usually Gets.

Every lender not only expects interest on his capital, but endeavours to lend only in such quarters as will also safeguard and maintain that which is lent. If Jones had lent his concern £20,000 and borrowed from Knight another £20,000 at 5 per cent. interest, there is no profit until Knight has received £1,000

Rented versus Owned Property.

Interest on capital has a bearing on the cost of production in many directions. Let us examine the question of rent. There are many concerns occupying premises which, whilst associated, do not belong to one owner. The business may have started in rented premises, but expansion has followed on hard work and an opportunity has presented itself of purchasing the freehold of adjacent premises. Is it conceivable that the work done in the older section shall still be charged with rent and that in the newer section escape scot free? Would it be fair to take the former rent and distribute it over the whole of the extended floor space? It is illogical. Therefore, what is to be the basis of the charge as rent for the freehold section?

What is Rent?

If it may be assumed that Knight's £20,000 was used to buy the premises, we have at once a charge of £1,000, to which must be added such other charges as repairs, insurance, depreciation, and Schedule A Tax. It may be taken for granted that where premises are owned it is not safe to use a figure on a lower basis than 10 per cent. on the value of the buildings as the figure for an inclusive rent.

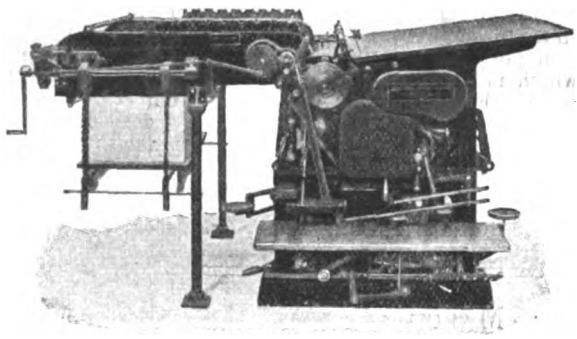
Capital Value Necessary for Comparison.

A further argument for the inclusion of interest is that of the importance of comparative figures. Take the composing-room as one illustration. How can a comparison of the merits of hand composition be made with those of mechanical composition unless cognisance is taken of the value of the plant to be used? Let it be assumed that each hand compositor needs type, fixtures and fittings to the value of not less than £250, and that his wages for 32 chargeable hours are £4, and that a monotype installation including metal, etc., runs up to about £1,300 with a wages bill of say £8 6s. for 40 chargeable hours, how can a comparison be made unless the capital expenditure is recognised?

How Some Businesses Run under a Handicap.

The whole of the factors, both of cost on the one hand and production on the other, have to be carefully weighed, and in the weighing the man who overlooks the necessity of securing a return on his investment as a first cost is handicapping himself heavily before he starts the race and will certainly lose it.

Some Illustrations.



Take another instance: Here is a quad-demy Miehle engaged on a good average quality of work from one month to the next. It is hand-fed and whilst speeded up to 1,500 revolutions produces a steady 1,000 per hour on long runs. If the wages for the feeder are £3 15s. per week what advantage would be secured by the addition of an automatic feeder, assuming the output were raised by 25 per cent.? The omission of interest on the additional capital value would make it impossible to compare figures to advantage.

A further instance might be quoted. Take an ordinary platen capable of being fed by a junior say at £1 per week. If it is thought to be an advantage to substitute an automatic platen calling for superior skill or closer attention, how shall it be proved to be a good proposition unless capital value is taken into account along with wages paid, and increased output? (The figures and machines mentioned are to be taken as illustrations only).

Take the questions of holding stocks of material and the amount of outstanding debts. These, while differing in form, are still capital items, and their effect on business cannot be realised unless interest is debited against them as a cost.

L&M
OFFSET LITHO ROTARY
WITH PILE DELIVERY.

FEED SIDE OF THE L&M OFFSET LITHO ROTARY WITH PILE DELIVERY.

This is a two-revolution press—a very desirable feature in a machine for colour printing in dead register. The printed sheets are delivered face up on the pile clear of the machine at a convenient height for examination. The plate cylinder is of large diameter, which facilitates perfect inking, damping, and manipulation of the plate. The damping mechanism is placed below the plate cylinder, so that splashing of water does not affect any other part of the machine. The ink distribution is highly efficient. A combination mechanism automatically trips the impression cylinder, inking rollers, ink-ductor, and water-ductor rollers. The machine attendant can fully control the press without leaving his seat.

It is built with Pile Delivery, but can be supplied with an ordinary delivery board if desired.

This Offset Press is built in three sizes:—

Machine No.	Size of Sheet.	Size of Design.
	in. in.	in. in.
No 1	37½ x 52	37 x 52
No. 2	33½ x 45½	33 x 45½
No. 4	25 x 37	24½ x 37

LINOTYPE & MACHINERY LTD.
9 KINGSWAY, LONDON, W.C.2

The Point of Application.

Every opponent of this principle agrees that interest on capital is a just charge; the disagreement arises on the point of application. If, however, it is left out of cost the margin for profit must be increased to secure it; if it is made an item of cost it is more certain of realisation, particularly in any industry in which competition is keen or which is the victim of seasonal variations in demand.

How Confusion has Arisen.

Like depreciation, this question of interest on capital has been confused in some minds by the relationship of the balance-sheet to imperial taxes. Taxes are levied on the reward for waiting as well as on the reward for working. But neither the official allowances for depreciation nor the merging of interest on capital into so-called profits for taxing purposes can prevent any business from putting into its costs an increased amount for depreciation or for interest on its capital.

How the Courts Define It.

The Courts recognise and define the position quite clearly when they say that a claimant is entitled to his expenses, his interest on capital and something for his adventure, commonly called "profit." Let the distinctions be marked.

A Suggestion Worth Consideration.

It is strongly urged that the Profit and Loss Account should be so constructed as to show the proper proportion earned by waiting (capital) and earned by working (profit). If this course were adopted it is to be feared that many businesses would find that "working" was inadequately paid, and that an equivalent return could have been secured by going on to the "waiting" list and letting others have the responsibility of working and worrying.

A CONFERENCE between the National Association of Wholesale Stationers and Paper Merchants and the British Association of Colonial and Foreign Paper Mill Agents was held recently at the offices of the former association. Various matters of mutual interest were discussed.

FILM OF BOOK PRODUCTION.—Ancona, Ltd., 37, New Oxford-street, London, W.C., announce to their participants that, resulting from their activities in connection with the Ancona film, the first British film on the making of a book has been produced for the University Press at Oxford by the Federation of British Industries. Part of this film by arrangement with the Oxford University Press, will form a section in the Ancona Film, "The Birth of a Book," which is to show the *rôle* of author, publisher, bookseller and mechanical production, and which will in the F.B.I. series of films secure a world-wide distribution via Messrs. Gaumont. As there has been, however, some delay in the production of the Oxford Film, the Ancona film has been correspondingly held back. The Ancona special exhibition motor car will show the film in the following places on the dates given: Macclesfield, May 4th to 8th; Sheffield, May 11th to 14th; Bury, May 18th to 22nd; Hanley, May 25th to 29th; Stoke-on-Trent, June 2nd to 6th; Burton-on-Trent, June 8th to 11th; Shrewsbury, June 15th to 18th; Wallsall, June 22nd to 25th; Leamington, June 29th to July 3rd; Worcester, July 6th to 9th; Newport, July 13th to 18th.

Photogravure from the Printer's Standpoint:

METHODS AND MACHINES

By R. B. FISHENDEN, M.Sc. (Tech.)

(Continued from page 198.)

The cylinders for photogravure printing were originally specially hardened copper tubes similar to those used by calico and wallpaper printers. It is found, however, that it is not possible to produce tubes of sufficient uniformity, and for this reason they have been discarded in favour of cast-iron cylinders having a copper surface prepared by electrolytic deposition. For this purpose a cast-iron sleeve is employed ¼in. in thickness, and on this the copper is deposited to a thickness of ¼in. The weight of a cylinder 56in. long by 40in. circumference, after depositing, is approximately 3½ cwt.

Electro-Deposition.

Great progress has been made in the method of depositing cylinders during the past ten years, and they now come from the depositing baths with a remarkably smooth surface. To prepare the deposited cylinders for use, a slight turning is removed on a lathe, and the cylinders are then accurately ground with a special stone on a polishing lathe until the surface is reasonably smooth; when they are of the correct circumference, the surface is finally polished by means of a special kind of charcoal.

In the earlier type of printing machine the cylinders were forced on slightly conical solid iron mandrils the shape of the insides of the cylinders corresponding to that of the mandrils, keyways prevented the cylinders rotating independently of their supports. The usual present method is to use expanding mandrils in place of the conical ones formerly employed, the former being found to be more convenient and satisfactory in practice.

In periodical printing it is necessary that the cylinders should always be of approximately the same diameter, in order that the size of the printed sheet shall retain its standard dimensions; in most sheet-fed rotaries, too, the mechanical construction of the machines does not permit of any considerable variation in the diameter of the printing cylinders. It is found, however, that some latitude is allowable from the standard requirements; thus, in the case of cylinders 40 in. in circumference it is usual to have the cylinders turned and polished when they come from the depositor to a circumference of 40¼ in., and to continue printing from them until the circumference is reduced to 39¾ in. The depth of a photogravure etching, from the author's measurements, is 0.04 m.m., ($_{6\frac{1}{2}5}$ in.), but owing to possible faults in the resist, it is found necessary to remove $_{3\frac{1}{2}}$ in. in circumference—approximately equal to $_{2\frac{1}{0}0}$ in. of copper removed; this allows for sixteen etchings on one cylinder before it is necessary to deposit.

Plates for Use on Cylinders.

To avoid the use of heavy cylinders, Mr. Ruddiman Johnson suggested that thin copper plates should be stretched round specially prepared iron cylinders, and the joints bridged with special filling-in pieces. This idea has recently received practical application in machines designed by Messrs. Penrose and by Messrs. Pickup and Knowles. The etched plates can be prepared without the complicated appliances necessary in dealing with heavy cylinders, and probably their use will be found less expensive than deposited cylinders. It is, no doubt, advantageous to be able to store thin copper plates for future use, whereas it would be economically impossible to store expensive etched cylinders.

Photogravure Machines.

Photogravure machines may be divided into several classes: simple web rotaries, flat-bed machines, sheet-fed rotaries, offset-gravure machines and newspaper or periodical printing machines.

The rotary intaglio printing machine in its basic form is of remarkably simple construction. Such a machine consists of an engraved cylinder supported horizontally upon its mandril, which is driven by suitable gearing. Underneath the engraved cylinder a roller is arranged covered with gelatine composition, or velvet, or other fabric. This roller is in contact with the engraved cylinder, and revolves in a trough of suitable fluid printing ink. As the engraved cylinder is rotated, a film of ink is applied uniformly to the surface and the cavities. The surface of the engraved cylinder is cleaned by a steel knife edge or "doctor" disposed parallel to and about level with its axis; the excess of ink drops from the back of the doctor into the ink trough. The pressure of the doctor upon the engraved surface is adjusted in some convenient way. In order to avoid uneven wear, and to remove any solid impurities in the ink which might scratch the copper surface, mechanical devices are provided to cause the "doctor" knife to traverse laterally, parallel with the engraved surface.

Above the engraved cylinder is a pressure bowl, or impression cylinder, covered with a coating of partially vulcanised rubber. The web of paper to be printed is brought between the two, and sufficient pressure applied to secure a solid impression. The pressure bowl revolves by friction contact and is not driven. A machine of this simple construction is capable of producing prints of the highest quality, and if of sufficient strength may, under suitable conditions, be run with satisfactory results at a speed of 10,000 an hour. With a normal quick-drying ink the printed reel may be passed almost immediately through the slitter and delivered as sheets, or it may be re-reeled to be dealt with later.

The wear on the copper cylinder due to the doctor is extremely small, and is much less than in calico or wallpaper printing, because the doctors that are used in the newer processes are much thinner: the normal thickness is from 9/1000ths in. to 12/1000ths in., whilst in some cases the steel is only 5/1000ths in. in thickness. The tempering of the steel is of importance, as well as the setting or grinding of its edge. The steel doctor is suitably supported on the machine with a heavier steel backing-up piece behind it, which allows ¼ in. to ½ in. of the thinner steel to project at the wiping edge and retain its flexibility.

An improvement in web rotary machines has been effected by the introduction of an intermediate pressure bowl. In this case the ordinary pressure bowl has an iron surface. Between it and the engraved cylinder is disposed another small cylinder of the necessary length covered with partially vulcanised rubber; the effect of this device is to obtain a narrower pressure line in printing, thereby enabling the necessary printing pressure to be obtained with reduced total load, thus reducing the mechanical strain on the frame of the machine.

Although the web rotary machine is perfectly satisfactory in the results it produces, it has serious practical limitations, because an expensive stock of paper of varying widths, qualities and weights must be maintained, and to avoid waste the circumference of the cylinders must bear the correct relationship to the size of the required sheet.

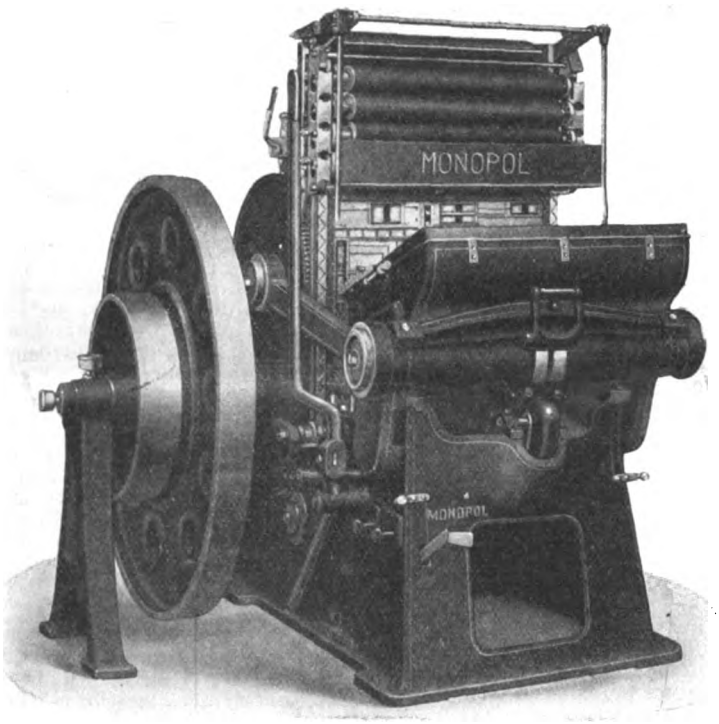
Flat-bed Machines.

The speed of machines of this type is restricted to about 500 impressions per hour. Such machines are of the ordinary stop-cylinder wharfedale or litho type, with a suitably arranged inking device and "doctor" wipe mechanism. There appears to be few advantages in this type of machine for gravure printing, except for small runs; although excellent colour work is done in this way; the machine consumes a large quantity of ink, and it has been found difficult to maintain a clean wipe.

The Waite flat-bed gravure machine is similar in construction to the Waite die-press; the printing plate is inverted, so that the arrangement of ink, furnishing roller and doctor knife usual in rotary machines can be adopted; the objections to the ordinary flat-bed type of machine are in this way avoided. The machine operates at a speed of 1,000-1,200 impressions per hour; two sizes are made, 15 in. by 10 in. and 10 in. by 6 in. Other suggestions have been made for a flat-bed machine designed in such a way that the engraved plate is supported in an inverted position with the furnishing roller, doctor knife, and impression cylinder travelling underneath it. Another suggestion was to adapt a letter-press heavy art platen for photogravure printing.

Sheet-fed Rotaries.

Sheet-fed rotary machines have been introduced to meet single-colour commercial requirements and also for colour printing. Owing to the considerable variations in the quality, thickness and sizes of paper, it is impracticable to meet the wide range of commercial requirements on machines of the web pattern. A number of sheet-fed rotary machines are now available, and some general observations on their design may be made.



Sheet-fed machines are usually fitted with expanding mandrils to hold the engraved cylinder in printing position. With few exceptions the impression cylinder is fitted with grippers to carry the sheets through the impression and deliver them, allowing sufficient time for the ink to dry before reaching the delivery table. Some machines are fitted with blowers or heaters to hasten the drying. Occasionally a cold air blast is caused to impinge upon the cylinder between wiping by the doctor and the impression, to counteract the tendency of some varieties of printing ink to leave a slight scum on the surface of the cylinder. This device is also used occasionally to increase the brilliance of the finished prints by accentuating the high-lights; this use of the air blast imparts to the prints excessive brilliance, but it robs them of the soft delicacy in the lighter tones usually admired in photogravure. With few exceptions, sheet-fed gravure machines are designed in such a way that the impression cylinder is twice the diameter of the engraved one; the latter makes two revolutions for every impression and is automatically "tripped" when the impression is not being made. This principle of construction either halves the output of the machine or doubles the wear on the etched surface. It would appear that machine designers might give some consideration to the design of machines on some principle which would avoid the unnecessary wear. The speeds of sheet-fed rotary machines range from 1,500 to 3,000 impressions per hour.

One of the first sheet-fed rotary machines to be built in this country was designed and constructed by Messrs. Taylor, Garnett & Evans, of Reddish, Stockport, but it is not on the market. Messrs. Penrose & Co., Ltd., have designed and manufactured a number of sheet-fed rotary machines to print sheets ranging from 39 in. by 33 in. to 20 in. by 15 in. Messrs. Pickup and Knowles, of Pendleton, Manchester, have constructed a sheet-fed machine without grippers. The impression cylinder is arranged above the engraved cylinder, the latter dropping out of position every second revolution. The sheet is fed between the two cylinders to a front lay that is in advance of the nip, and the engraved cylinder rises and grips the sheet and takes it through the impression. This principle has recently been applied by this firm to a small machine taking sheets 12 in. by 18 in., designed to accommodate thin etched copper plates stretched round a suitable iron cylinder in place of the usual copper cylinder. The space between the edges of the copper sheet is

(Continued on page 246).

The above is the substance of lecture delivered before the London Central District Master Printers' Association on March 4th.

Built in 3 sizes:
$9\frac{1}{2}$" x 13," $13\frac{1}{3}$" x $17\frac{3}{4}$," and 16" x $21\frac{1}{2}$."

The "MONOPOL" Art Platen.

- Specially built to produce the very best Heavy Tint and Register Colour Work at a High Speed.
- Embodies many patented improvements.
- The Roller Carriage has a special spurwheel drive, which imparts it a perfectly smooth and noiseless motion. This important improvement does away with the cam action in the main gear-wheel, which is subject to great wear and necessitates frequent costly repairs.
- Throw-off Inking and Distributing Rollers, from each other and from the Inking Cylinder, by a single lever movement.
- Separate Drive for Inking Rollers, permitting inking-up without running the machine, or enabling the platen to be worked for embossing, etc., without the inking rollers moving.
- The forme is supplied with fresh ink both during the downward and upward movement of the roller carriage.
- Automatic Hand Safety Guard, which can also be used as a throw off. Only a gentle touch of the guard is required to stop the machine.

Trade Notes.

THE balance of the debentures of the Newnes and Pearson Printing Co., Ltd., numbering 7,500 of £10 each, will be redeemed on September 30th next at 5 per cent. premium.

ALLIED NEWSPAPERS, LTD.—The purchase of the *Newcastle Chronicle* and associated publications by Allied Newspapers, Ltd., has been completed. Allied Newspapers, Ltd., of which Sir William E. Berry is chairman, was registered in March, 1924, with offices in Manchester, to acquire the *Daily Dispatch*, *Evening Chronicle*, *Sporting Chronicle*, *Sunday Chronicle*, *Empire News*, and *Athletic News* from *Sunday Times*, Ltd.; also the general printing business of E. Hulton and Co., Ltd.

THE *Diss Express*, with the accompanying printing stationery and bookselling business (trading as Edward Abbott) has been disposed of by the daughters of the late Mr. Edward Abbott to Mr. D. W. Comer of Eye. The printing business was commenced by Mr. Charles Abbott, who set up the first printing press in Diss in September, 1790, and it has ever since been in the hands of the family, who have carried it on in the present premises since the year 1830—a notable record. The business will in future be known as the Diss Publishing Co., Ltd., with Mr. Comer as managing director.

THE annual dinner of the Sheffield and District Master Printers and Allied Trades Association was held at the King's Head Hotel, Sheffield, on Wednesday of last week. Mr. Edgar T. Northend (president) was in the chair and there was a good attendance. The toast of "The Federation of Master Printers and the Yorkshire Alliance" was proposed by Mr. J. W. Hyde. Mr. W. B. Wykes, president of the Federation of Master Printers, replied, as did also Mr. Percy Hartley, president of the Huddersfield Master Printers' Association. Mr. George W. Jones submitted the toast of "The Sheffield Master Printers' and Allied Trades Association," response being made by Mr. Northend.

THE Bristol Master Printers and Allied Trades Association held its annual dinner at the Royal Hotel, Bristol, on Thursday last, when the president, Mr. G. A. Arrowsmith-Brown, was in the chair, and those present included the Lord Mayor (Mr. E. Brookhouse Richards, J.P.), Messrs. W. B. Wykes (president of the Federation), G. H. Holloway (vice-chairman, Bristol Master Printers' Association), and W. E. Harding (president, Bath Master Printers' Association).

THE South-West London Master Printers' Association is to hold its annual meeting on Tuesday, April 7th, at Arding and Hobbs' Restaurant, Clapham-junction, S.W., at 6.30 p.m. The occasion will be utilised for the showing of members' printing specimens intended for the Inter-District Competition.

IN an address on "Craftsmanship and the Printers" to the Sheffield Joint Industrial Council of the Printing and Kindred Trades Federation, on Thursday, Mr. G. W. Jones urged them to see that their ancient and honourable calling should not become lost in business and industry. They should give in their work the highest expression of their knowledge, skill, patience and sacrifice. Craftsmanship was not simply doing beautiful things, but doing perfectly even the simplest thing.

HISTORY OF MODERN PRESSES.—Mr. G. S. Tomkinson, of Kidderminster, states in the literary supplement to *The Times* that he is compiling a history and bibliography of modern presses, and asks for information regarding the Cloister, Orpheus, Sale Hill, and other presses. In addition to these he will welcome information concerning other presses. He gives a list of 71 presses with which he will deal, including the Oxford and Cambridge presses, the Beaumont, the Chiswick, and the Golden Cockerel presses.

THE directors of the well-known firm of Wyman and Sons, Ltd., invited the Bookstall and Advertising Departments to dinner at the Hotel Great Central on Saturday evening. The gathering of over 200 members of the staffs included many representatives of influential publishing and distributing firms and railway companies, and was presided over by Mr. H. W. Pountney (managing director).

BY a strange coincidence, Messrs. Raphael Tuck and Sons, Ltd., have just produced a book for Madame Tussaud's containing coloured illustrations of some of the tableaux which perished in the fire. It is issued by Madame Tussaud's at the price of 1s. 6d.

PRINTING EXHIBITION AT LIVERPOOL.—An exhibition of book, illustration, poster and general printing, organised by Liverpool School of Art, and stated to be the first of its kind in this country, was opened at the Walker Art Gallery, on Monday, by Mr. Harold Curwen, of the Curwen Press, Plaistow. The Lord Mayor (Alderman T. Dowd) presided at the opening.

THE death is announced of Mr. Frederick William Carter, J.P., in his 79th year, senior partner of Carter, Greig and Co., Edinburgh. He was a director of Bertrams, A. B. Fleming and Co., B. Winstone and Sons and other undertakings. Mr. Carter was admitted to membership of the Society of Accountants of Edinburgh in 1868.

THE death occurred on the 18th inst., at Manchester of Mr. James Robinson, in his 80th year. He was Manchester Corporation Stationery Manager for 42 years.

THE death has occurred at Tulse Hill, in his 77th year, of Mr. William Fancourt, who, when he retired at the end of March, 1920, had completed 57 years of service on the staff of *The Times*.

THE funeral of Mrs. Mascord, wife of Mr. G. W. Mascord (general works superintendent of United Newspapers (1918), Ltd.), took place on Wednesday of last week at Barnes Common Cemetery, London. A memorial service was held at St. Mary's Parish Church, Barnes, and among those present were many of Mr. Mascord's colleagues of the *Daily Chronicle* and the *Sunday News*. Many wreaths were sent.

THE late Mr. T. F. Ordish, F.S.A. (69), of Herne Bay, formerly editor of *The Bookworm* and the *London Typographical Record*, left £1,052 (net personalty, £976).

Trade Union Matters.

TYPOGRAPHICAL ASSOCIATION EXECUTIVE.—Messrs. J. J. Atkins (Birmingham), W. Bottomley (Leeds), C. N. Athey (Newcastle), C. Powis (Cardiff), H. T. Whitley (Belfast), and G. Holmes (Manchester), machineman, have been elected unopposed to the new Executive Council of the T.A. Ballots will take place in the other districts of the Association to complete the full number of 22 executive members.

CHRISTMAS DAY WAGES POINT.—The secretary of the Maidstone branch of the Typographical Association has received an answer from the Executive Council on a wages point in regard to Christmas Day raised by a staff of machine minders employed on night work. These members worked four nights, Monday, Tuesday, Wednesday, and Thursday, of eleven hours each. They were asked to work overtime on Friday (Boxing Day), which they did, and wished to know what rate of wage should be paid for that day. The decision now forwarded is that time and a half should be charged for all the time worked on Boxing Day.

LEAD POISONING COMPENSATION.—After considerable delay, a decision has been announced in the case of a member of the Wellington branch of the Typographical Association, who claimed compensation for an illness caused by lead poisoning. The Medical Referee found in favour of the member, and under the award the employers will pay all arrears of compensation from date of the member's ceasing work, and in addition a permanent payment of 30s. per week.

COMPENSATION CASE AT HYDE.—The secretary of the Hyde branch of the Typographical Association has reported to the Executive Council on the case of a member in his branch who met with an accident while at work by which he lost the first and second fingers of his right hand up to the first joint and the tip of his third finger. After receiving compensation for seventeen weeks, the insurance company had given notice that after the next payment the compensation would cease and a lump sum of £15 would be paid. The Executive Council directed legal advice to be taken on the case.

N. U. P. B. M. R. AND PAPER WORKERS' CHARITIES. — Under the auspices of the N.U.P.B.M.R. and Paper Workers' Sports and Social Association a fun carnival and dance is to be held at Prince's Hall, Lambeth Baths, Kennington-road, on Monday, March 30th. Tickets of admission (1s. 6d.) can be obtained from the hon. secretary of the Association, Mr. A. McLeod, 21, John-street, W.C.1. The famous Super-Synco Band will be in attendance.

Personal.

THE Rt. Hon. Lord Riddell of Walton Heath, Sir Sidney Lee, biographer of the late King Edward and editor of the National Dictionary of Biography, and Sir Ernest Wild, late Recorder of the City of London, are among those who have accepted invitations to be present at the annual dinner of the London Master Printers' Association at the Connaught Rooms on April 27th.

SIR WILLIAM WATERLOW, Sir J. Baddeley and Sir Rowland Blades, M.P., were amongst those present at a banquet at the Mansion House on Wednesday evening of last week when the Masters and Prime Wardens of the Livery Guilds of the City were the guests of the Lord Mayor and the Lady Mayoress.

MR. T. L. JENKINS, of the *Surrey Times*, has been elected chairman, Mr. H. H. Norman, of the *South London Press*, vice-chairman, and Mr. Charles Kent hon. secretary of the Surrey Newspapers' Association.

MR. J. RAFFIELD (*Illustrated London News*) occupied the chair on the occasion of the last bohemian concert of the season of the Electrotypers and Stereotypers' Auxiliary on Monday at Anderton's Hotel, Fleet-street.

MR. J. R. RIDDELL, principal of the London School of Printing, seems to have been particularly busy of late in respect of the addresses with which in various parts of the country he renders good service to the printing and allied trades. Of recent weeks we have had several times to refer to some of his many activities in this direction.

LAST week Mr. Riddell broke somewhat new ground when he attended the annual conference of the Technical Section of the Papermakers' Association and, along with Mr. W. J. Pollock, placed before that expert body some of the difficulties experienced by printers in handling and using paper.

ON Saturday last Mr. Riddell visited the P. M. and O. A. Centre at Nottingham and gave an address on "Some Things that Happen in Printing Offices," being—as usual when he visits the town with which he was connected for so many years—received with considerable enthusiasm.

MR. PAUL REED, a Liverpool journalist, has been invited to stand as Labour candidate for the Bodmin Division of Cornwall, and has consented to do so.

SIR ALBERT SPICER, who is in India with Lady Spicer and a daughter, reached his 79th birthday last week. The family are on a visit to another daughter, who is a missionary.

ALDERMAN SIR THOMAS VANSITTART BOWATER, BT., M.P., has been re-elected Governor of the Irish Society.

MR. G. E. GARRETT (Edward Lloyd, Ltd.) has been presented with a silver cigarette case, suitably inscribed, by the Sittingbourne Paper Mills Sports Club as a memento of Mr. Garrett's scoring the first century on the new sports ground.

MR. C. R. SEDDON presided on Thursday of last week at the annual meeting of the Papermakers Association and also at the dinner in the evening, following his re-election as president. A report presented at the meeting reviewed the varied activities of the Association during the past year, particular reference being made to the work of the Technical Section under the chairmanship of Commander Pirie.

AT the annual dinner in the evening, attended by some 450 persons, representing the whole of the allied trades, Sir T. Vansittart Bowater, M.P., proposed the toast of "The Association" and Mr. A. Ralph Reed "The Visitors and Allied Trades," responses to the latter toast being made by Major the Hon. J. J. Astor, M.P., and Mr. Frank W. Clarke, president of the Canadian Pulp and Paper Association. Mr. A. E. Goodwin, secretary of the Federation of Master Printers, was amongst those present.

NORTH

London Master Printers' Association

Presentation to Mr. W. J. Mizen.

Master printers of North London with their ladies attended in large numbers on the occasion of the annual bohemian concert of this Association on Tuesday of last week at Wortley Hall, Finsbury Park, N. There was a well arranged and popular musical programme and ample opportunities were afforded during the evening for social intercourse, as well as for generous refreshment, all combining to bring about a highly successful and enjoyable evening. The following were amongst those present: Messrs. Alfred Langley (president, L.M.P.A.), L. F. Hunt (president, N.L.M.P.A.), F. Mason (secretary, S.E. Association), F. H. Cole (secretary, S.W. Association), W. Whyte (secretary, L.M.P.A.), W. R. Cummins, D. A. Whitehead, F. J. Collins, and W. J. Mizen (secretary, N.L.M.P.A.).

The musical arrangements were in the capable hands of Mr. F. J. Collins. During an interval in the programme a surprise presentation was made to Mr. Mizen of a handsome solid oak Jacobean smoking cabinet, which bore the following inscription: "Presented to W. J. Mizen, Esq., by members of the N.L.M.P.A. in appreciation of his services to the Printing Craft. March, 1925."

Mr. W. J. Mizen.

The Presentation.

Mr. A. Langley, who made the presentation, referred to the fact that his name in connection with the ceremony had been printed on the programme in large type. He supposed that was because he officially represented the London Master Printers' Association. Proceeding, he humorously remarked there was no type large enough to describe adequately the importance of that body. That day they had been engaged at the central offices on work of a very arduous character, and though he was not going to trouble them that evening with Federation or L.M.P.A. politics, he believed they had put up for London master printers a good fight which would have a very far-reaching effect. They were engrossed that evening in matters of pleasure, and he felt gatherings of that kind had a vital interest for the future welfare of the Association. He then recalled a meeting in 1916 when North London printers met and persuaded Mr. Mizen to take charge of the district. It was a wise selection; and nobody realised—even in the smallest degree—the hard work Mr. Mizen had had to encounter in that very scattered area, reeking as it was at that time with apathy. In spite of many disappointments and discouragements in the past, Mr. Mizen had persevered, and to day they were proud of all he had been able to accomplish. The excellent work Mr. Mizen had done for printers generally at headquarters was also fully recognised and appreciated. On behalf of the members of the North London Master Printers' Association Mr. Langley then asked Mr. Mizen to accept the gift. In doing so he said it did not represent in any way the value they placed on their friend's efforts, but was a token of the love and affection which members of the Association bore to their secretary.

Mr. Mizen, in returning thanks, was visibly affected by the spontaneity of the occasion. He said life was full of surprises, and the way they had shown their kindness to him that evening added evidence of it. However, they got used to surprises, for they had to meet them very frequently in the printing office. He had tried to stick to his bit of work in the hope of doing some little good to fellow master printers during his passage through this world. He wished them to know that it was Mr. Langley that in 1916 had called North London master printers together, and it was through his (Mr. Langley's) initiative that their district Association was founded. At that meeting he was appointed temporary secretary, and for some reason or other he had continued in that capacity ever since. At the moment he felt he could not express in appropriate words his appreciation of the great kindness they had shown to him.

The Artistes.

The concert was pleasingly varied in character, both humour and sentiment being well represented. The following were the artistes:—Miss Evelyn Clifford, Miss Suzette Tarri, Miss Winifred Vaugham, Mr. Harry Hearne and Mr. John Humphreys.

On the proposition of Mr. L. F. Hunt, seconded by Mr. W. Wilson (vice president) a vote of thanks was heartily accorded to Mr. Collins and the artistes for their contributions to the evening's enjoyment.

The singing of "Auld Lang Syne" brought a successful evening to a close.

S.E. London Master Printers.

Association's Annual General Meeting.

The tenth annual general meeting of the Association of Master Printers of South-East London, held at the Bridge House Hotel on March 10th, called forth a good attendance of members, and the whole proceedings, both social and business, were notable for the cordiality and enthusiasm displayed.

Commencing soon after 6 p.m. under the chairmanship of Mr. J. J. Griffiths, president of the S.E. Association, the meeting first occupied itself with the usual annual business agenda, which included reports of the year's work, and the election of officers for the coming year.

Following the reading and signing of the minutes of the last annual general meeting, the secretary, Mr. F. Mason, read his report. It was easy to see from this report that there is now in South-East London a real live organisation of master printers, with a membership of well over 150. Its representatives on the Council are in great demand at headquarters, and are members of most of the sub-committees formed, thus proving that the opinion of the South East Association is held in high esteem by Old Bailey. The social events held during the past year have been highly satisfactory and successful.

The report of the treasurer, Mr. H. H. Norman, was also a satisfactory one, he being able to report, amongst other things, that all the social events held during the past year had been managed at a cost (to the Association) of less than £1 per head per member, which must be considered an excellent performance.

Both reports, ably sponsored by Messrs. Jenkins and Errington, were cordially adopted.

Mr. Griffiths, introducing the election of officers, said he had appreciated very much the honour conferred upon him twelve months ago, and during his term of office, had tried in a small way to do something to help along the work of the South-East Association. He would take this opportunity of thanking all members for their support during his presidency, and trusted they would afford the same measure to his successor whom he now named in the person of Mr. H. R. Grubb, and further remarked that he (Mr. Grubb) had been a regular attendant at the meetings, and had taken a great interest in the affairs of the South-East Association. This nomination was seconded by Mr. J. Lack, who said he felt sure Mr. Grubb would do all in his power to carry on and strengthen the good work already accomplished, and he (Mr. Lack) would be ready at all times to accord Mr. Grubb what help and support he could. Mr. Griffiths was pressed to continue in the office for a further twelve months, but having made it quite clear that he had no intention of so doing, and there being no further nominations forthcoming, that of Mr. Grubb was accepted with acclamation.

Messrs. J. Lack and H. H. Norman were elected vice presidents.

Mr. G. Poulton cordially proposed the re-election of Mr. F. Mason as secretary, referring to him as a tried and trusted friend, and Mr. Griffiths also emphasised the great deal of work put in by Mr. Mason during the past year.

Mr. H. H. Norman was unanimously re-elected treasurer.

The following were elected to constitute the committee: Messrs. G. Neves (Woolwich), J. W. Jackson (Bermondsey), J. Bryant (Greenwich), C. Northam (Norwood), and E. H. Crosskey (Lewisham).

The following were elected as representatives on the Council: Messrs. Brigenshaw, Griffiths, Grubb and Mason

Following this, a very hearty vote of thanks to the retiring president, Mr. J. J. Griffiths for his great work during the past year on behalf of the South-East Association, was proposed by Mr. Grubb, who said that the best thanks of the whole South-East Association was due to Mr. Griffiths for his untiring energies to build up and strengthen not only the South-East Association, but the London Master Printers' Association as a whole. This vote was cordially seconded by Mr. G. Poulton who said there was no question whatever regarding the enormous amount of work accomplished by Mr. Griffiths during the past year to build up and strengthen the L.M.P.A. Mr. Langley, president of the L.M.P.A., added a further eulogy regarding Mr. Griffiths' work, and said that he personally had found the co-operation and help of Mr. Griffiths most useful during his term of office as president of the L.M.P.A. Yet another testifier as to Mr. Griffiths' sterling qualities was forthcoming in the person of Mr. J. J. Keliher, and the vote of thanks was carried amid scenes of great enthusiasm.

Mr. Griffiths in thanking the meeting for their vote of thanks assured them, that although no longer in the presidential chair, he would not abate his efforts to strengthen the Association and should Mr. Grubb be unable to attend any meeting, he would be pleased to deputise or help in any other way he could. He was very pleased to see present Mr. A. Langley, who had done much useful work on the Council during his year of office as president of the L.M.P.A. Another welcome visitor was Mr. W. J. Boyle, who seemed to be endeavouring to break all records in the matter of attendances. He was also pleased to see present Mr. W. Whyte, secretary of the L.M.P.A., who, in spite of his work at Old Bailey, had managed to put in a number of attendances at South-East meetings.

Mr. Lack put forward a suggestion that a visit might be paid to a paper mill again during the next few months, and suggested either the Apsley mill of Messrs. J. Dickinson and Co., Ltd., or a hand-made mill of Messrs. Spicers, Ltd.

Light refreshments were served during the course of the evening, and the business agenda being concluded, the company were entertained by a party of artistes under the direction of Mr. W. Martell, and from the volume of applause at the conclusion of each item, it was evident that their efforts to please had met with success. The singing of "Auld Lang Syne" and "God Save the King" at 9.30 p.m., concluded yet another pleasant and enjoyable function.

THE death has occurred at Stockton of Mr. H. Russell of the firm of Messrs. H. Russell and Sons, printers of that town.

Exhibition of Printing Specimens.

The subject of typographical display was in the ascendant at the meeting of the Association of Master Printers of East and North-East London, held at the Langthorne Restaurant, Stratford, on Wednesday of last week, the evening being devoted to the exhibition of printing specimens submitted in connection with the Inter-District Association Competition. An important feature of the gathering was the presence of Mr. R. B. Simnett, president of the South-West Association.

Nomination of Officers.

The president, Mr. G. F. Tomkin, took the chair after tea, and several items of routine business were first dispatched. These included the nomination of officers for the coming year. An appeal was made for a nomination for a new president, but Mr. Tomkin eventually accepted the meeting's insistence upon his re-election, the secretary and others indicating the high esteem in which Mr. Tomkin's past services as president are held. Messrs. H. W. Upton and A. G. Reynolds were nominated as additional vice-presidents. The hon. secretary, Mr. T. D. Hawkins, and the hon. treasurer, Mr. S. T. Norman, were thanked for their services and nominated to serve again. To act as committee, the vice-presidents were nominated, together with Messrs. C. Lipscomb, — Wood and F. W. Ratcliffe. Messrs. S. T. Norman, G. F. Tomkin and A. G. Reynolds were nominated to represent the Association on the L.M.P.A. Council.

Those contributing specimens to the exhibition included: Messrs. The Curwen Press (Plaistow), G. Reynolds (Stepney), H. R. and A. Scott (Stratford), the Jackson Press (Stratford), G. F. Tomkin (Leytonstone), The Mercury Press (Ilford), Hawkins and Son (East Ham), W. H. Gillard (Bow), and Lipscomb (Forest Gate). The exhibition was an interesting one, and, if not very extensive, certainly contained much really first-class work of which any master printers' association might justly be proud. It covered a very wide range of letterpress work, from the smallest card right up to poster printing, and included admirable examples of periodical and booklet production, together with some beautiful facsimile multi colour reproductions.

After members had been allowed time for a general inspection of the exhibition, Mr. Simnett was called upon to address the meeting.

Mr. Simnett Discusses the Exhibits.

Mr. Simnett, after expressing his pleasure at making the acquaintance of the East and North-East Association, took the opportunity also of bearing personal testimony to Mr. Tomkin's able services in representing the E. and N.-E. Association on the Council of the L.M.P.A. He then proceeded to discuss in helpful fashion the subject of "perfect printing." He urged its value on the practical side, also the joy to be found by those engaged in its production. That a man's greatest happiness in life should coincide with his business was, he thought, the highest ideal; and when a man's business was printing, he was in the happy position of being able to run riot in bringing all the best that was in him to bear upon his work. The printer was uniqué among traders in that he had to sell an article that did not exist; every job involved a creative effort.
